SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

LINSEED AND CORN CRUSHING MILLS.
E. R. AND F. TURNER, St. Peter's Iron Works, Ipswich, have, during the present season, obtained the Prizes of the Royal Agricultural Society at Lincoln, the Bath and West of England Society at Bath, and the Yorkshire Agricultural Society at Ripon, for their celebrated ROLLER MILLS for Crushing Corn, Seeds, &c. These are manufactured of various sizes, particulars of which, with Illustrated Catalogue of Steam Engines, new Prize Chaff Cutter, and a variety of other Implements, manufactured by E. R. & F. TURNER, may be had free on application at the Works, Ipswich, or by Post, inclosing two postage stamps.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

TO FLORISTS AND OTHERS.
J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

GRANITE.—ENTRANCE GATE PILLARS, COPINGS, and every kind of Yard and Stable Pitching; Field and Garden Rollers, Stack Pillars and Caps, Cattle Troughs, Window Sills, and at prices reduced by railway carriage.
Apply to H. SWIFT, Brent Moor, Ivy Bridge, South Devon.
Specimens to be seen at the Wharf, Globe Bridge, Globe Road, Mile End, London.
Monuments according to design and estimate.—Agents wanted.

WEEDS ON WALKS.
MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

LAND DRAINAGE.
MR. JOHNSON begs to inform Landowners, Agents, &c., that he is prepared to undertake the Drainage of any description of Land, either by contract, or by a small charge per acre for planning and setting out the drains, taking levels, and superintending the work. Numerous satisfactory references can be given by Mr. J., who has been for several years in constant practice as a Draining Engineer.—Address 12, Abingdon Street, Westminster.

CHEMISTRY.—A Gentleman, who has had great experience in Practical Chemistry, is willing to give private instruction in Chemical Analysis, especially in its application to Agriculture and the Arts.—CHEMICUS, care of Mr. Stanford, 6, Charing Cross.

EDUCATION.
THE REV. C. A. JOHNS, B.A., F.L.S., Author of "Botanical Rambles," "The Forest Trees of Britain," &c., educates 12 young Gentlemen for the Public Schools, Sandhurst, &c. There will be TWO VACANCIES at Christmas.
Culliper's Hall, Watford, Herts.

AGRICULTURAL TUITION.—Sons of Gentlemen received as Agricultural Pupils into the family of a Clergyman occupying a Farm, cultivated under the Improved System, 25 miles from London.—Address Rev. C. C., *Agricultural Gazette* Office, Charles Street, Covent Garden, London.

THE BIRMINGHAM POULTRY SHOW, 1854.
The SIXTH GREAT ANNUAL EXHIBITION OF DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of December next. Copies of the Prize Lists and Certificates of entry may be had on application to the Secretary.
In addition to the prizes announced in the list dated the 23d of February last, the General Purposes Committee of the Council have resolved to offer First Prizes of 2l., and Second Prizes of 1l., for Single Cock Birds of any age, of all the following varieties, viz.: Dorking, Spanish, Cochin China, Bramah Pootra, Pencilled Hamburgh, Spangled Hamburgh, Game, and Polish; and that the same shall be entered under Letters A to I on the ordinary certificates, and exhibited separately.
Seven Silver Vases, of the value of six guineas each, will also be awarded, instead of money prizes, for the best pen of Pencilled Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, and Game Fowls.
First, Second, and Third Prizes of 3l., 2l., and 1l. respectively, are offered in all the Classes for Fowls, as well as for Turkeys, Ducks, and Geese. Liberal Prizes will also be awarded to good specimens shown by Cottagers, whose entries must be made on a form of certificate different from that used for the general classes.
The ENTRIES CLOSE on SATURDAY, the 11th of November.
JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham, November 4.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of December next. The PRIZE LISTS and Certificates of Entry may be obtained on application to the Secretary. The Entries close on Saturday, November 11. JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham.

THE SALISBURY AND WESTERN COUNTIES EXHIBITION OF DOMESTIC POULTRY.—The Fourth ANNUAL EXHIBITION will be held on TUESDAY and WEDNESDAY, the 21st and 22d days of November, 1854. Prize Lists, with the Rules and Regulations, can be obtained of the Hon. Secretary, and Subscriptions will be received by Mr. EWER, the Treasurer. T. PAIN, Hon. Sec.

SMITHFIELD CLUB, 1854.
CHRISTMAS FAT CATTLE SHOW.—The Annual Show of Fat Cattle, Sheep, and Pigs, will take place on the 5th, 6th, 7th, and 8th of December, 1854, at the Carriage Bazaar, King Street, Portman Square, London.
All Certificates must be returned to the Honorary Secretary on or before SATURDAY, the 4th November, 1854.
Prize Sheets, and the necessary Printed Forms of Certificates, are now ready, and can be obtained on application to
B. T. BRANDRETH GIBBS, Hon. Sec.
Corner of Half-Moon Street, Piccadilly, London.

The Agricultural Gazette.

MONDAY, NOVEMBER 4, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, Nov. 9—Agricultural Imp. Society of Ireland

THE remarkable rise in the price of Wheat during the past few weeks has received full attention and discussion in our Monday's edition. We refer to it here in a single paragraph, merely to notice the relation in which it stands to the policy of extending an acquaintance with the statistics of British agriculture. It has been urged that this unexpected change in the market value of agricultural produce would have occurred with all the suddenness which has characterised it, although we had known precisely what the produce of this country this season has been: that it has not been owing to any ignorance suddenly removed, or to any alarm, the result of ignorance still existing on this point: that, in fact, it is to the absence of information regarding the produce of other countries that we must attribute the singular history of the corn market during the past month—ignorance of *their* ability to supply the English market—a source of derangement and injury to which we shall continue to be exposed, whether Mr. HALL MAXWELL in Scotland, or the Government in England, shall succeed or not in telling us soon after harvest every year what the produce of that harvest has been within the limits of our own country.

Now, this may be correct or not. We cannot yet say whether the sudden rise in prices is or is not affected by ignorance of our English produce. Some months hence we may learn that, had we known better what that actually is, the rise need not have been so great; or we may learn that that produce is less than it is now supposed to be—and a further rise may take place later in the season, which, had it taken place earlier, would have both encouraged the importation and enforced the economy by which limited supplies are supplemented and extended.

To those, however, who would argue the uselessness of statistical information regarding British agriculture from the present experience of the corn market, we would reply that this experience has, at all events, arisen from the absence of correct information hitherto—that it proves, at all events, the general proposition in connection with which the case of English agriculture is a particular instance; so that, to sum the whole up in a single sentence, if information as to the whole food supply of a country is of the highest importance to the national interests, then correct intelligence of the abundance or deficiency by which any one source of that supply is characterised is also desirable—desirable just in proportion to the rank which that particular source bears amongst the others to which consumers are in this country indebted. How largely the home supply overtops every other in this respect everybody knows.

DURING a summer of drought which has drained wells and ponds, and almost emptied many rivers, our remarks on ARTERIAL DRAINAGE have also run dry. Not because we needed floods to alarm the public into a consideration of the subject: the scarcity of water, as well as its mischievous excess, makes us feel the want of a due control of our rivers. Whether a man be drowned in his own house in winter, or perish of thirst in summer, *irregularity of supply* is in each case the cause of the calamity.

Now there have been very general complaints throughout the kingdom of the evils following a long absence of heavy rains. Cattle pining without drink, or impoverished and diseased by foul water, have left us with a scarcity of fat meat; and from meadows bare of hay, and green winter-keeping short and scanty, there is but a poor prospect of provender to last until spring. Thousands of families in many towns and over large districts of country have been reduced to a stinted allowance of turbid unwholesome water; and while sickness falls among them with an increased fatality, they sometimes appeal against the helpless water-companies. Millers want a "head" to urge round their wheels; barges run aground in half-emptied canals; and some inland navigations have been compelled to cease their traffic. All this loss and suffering impels us to the work of "trunk drainage;" for this means not simply agricultural drainage, but a complete command and control of all our annual rain-fall and springs for drainage, irrigation, mill-power, navigation, supply of dwelling-houses, factories, &c., and in fact, a thorough utilising of our abundant streams for all purposes whatsoever. Providing for the speedy evacuation of flood waters is not everything: the experience of the past season has proved that water is indeed *worth something;* and should be made proper use of before being suffered to escape. No scheme of general drainage can be relied on as sufficient, or is worth the cost of the hard struggle necessary to obtain it, that does not embrace the management as well as the discharge of our waters to the best advantage; though, of course, there are low, wet districts to be found, where a perfect agricultural drainage alone would be a cheaply-won improvement: but even in such unfortunate cases, how much more satisfactory would be a work combining other important objects with this one.

Our fen-men, who have been bound in a long apprenticeship to the trade of river making, are apt to consider our proposal as introducing so much unnecessary complication into the business; and this, because they have no experience of mill-dams, or meadow irrigation; and have always had to battle against instead of partaking with an inland navigation. But it is out of these level lowlands, along sloping river valleys hitherto unattempted by drainers, that the *power* and *valuable properties* of flowing streams must be duly appreciated and thriftily employed. And instead of placing obstacles in the way of good drainage, this course will be found to avoid the main difficulty of all—namely, the impracticability of subordinating or altogether destroying many rights and interests for the sake of one.

Now, as to the simple supply of water to lands in dry weather: once obtain a good descent and efficient outfall for your stream, and you will be able with ease to supply carrier-drains, or artificial reservoirs from the stream itself; you may store up volumes of liquid ready against a dry time,—if not in sufficient quantity to fill the ditches of your valley with all the moisture the ground may require, at any rate affording a most valuable relief to parched fields and thirsty stock. Sometimes in flat districts, when a channel both drains in winter, and waters in summer, by allowing the river with which it communicates to revert up it in dry seasons—the

mere perfecting of a water-way along a single drain is all that is required. Thus we know of several marsh farms in Lincolnshire which might enjoy a more complete drainage if a single tunnel under a road (situated upon the course of their joint outfall drain) were enlarged in capacity, and the channel of the drain otherwise improved. In wet seasons the water in the open drains remains for weeks together above the level of the under-drains; so that the land is almost saturated, and the occupiers try with surface-grips to dry the sodden furrows of their Wheat fields, and draw off pools and plashes from their Grass and Turnips. But the contracted parts of the outlet measure its capability *both ways* —for indraught as well as delivery. Had it been of proper dimensions throughout, enough water could have been admitted from a large tidal river to fill the now empty division ditches (thus fencing in the live stock which have been most troublesomely wandering into growing green-crops) and to feed both ponds and wells by its filtration; whereas, the sheep and cattle, and indeed all living animals (human beings included), have been deteriorated and diseased by drinking the only water they could procure—namely, the foul and filthy residuum in the bottoms of the open pits.

In cases where the elevated position of an estate, or its distance from any adequate water-course, renders any method of sub-irrigation impossible, it is a matter for very serious consideration whether a reservoir ought not to be excavated or formed by damming a small brook, and the drain-water of that one estate or farm conducted into it—now that water-drills and liquid-manure distributors, and the system of permanent piping and steam-pumps are striving together to apply farm-manure in the most economical manner. *I. A. C.*

NOTES ON EXPERIMENTS IN THE GARDEN OF THE ROYAL AGRICULTURAL COLLEGE.

By Professor James Buckman.—No. VIII.

(*Continued from p.* 698.)

The species of Grasses next on my list belong to that useful but puzzling genus Festuca, of which the three first are the following:—

14. Festuca pratensis, Meadow Fescue.
15. „ elatior, Tall Fescue.
16. „ loliacea, Spiked Fescue.

Of these, three were planted five years since—a plot of the usual size for each example with seed from the Messrs. Gibbs. In each case the seed came up very well, and the result of the second year's growth was the softer herbage and smaller culms of the F. pratensis. The coarser herbage and tall strong culms of the F. elatior and the spicate F. loliacea. In the third year, however, a great change had taken place, inasmuch as the F. pratensis became coarser, thus simulating the F. elatior, whilst the F. loliacea became indistinguishable from the first form of F. pratensis; at the present date, 1854, the whole of the beds are studded with rough plants of the F. elatior, with an occasional admixture of the F. pratensis form. These experiments, therefore, tend to confirm the belief which I have for some time entertained, that the three forms adverted to are referable to one specific type, and the practical bearing of the matter is no less important, inasmuch as if a Grass like the F. pratensis as it occurs in rich lowland meadows is so capable of change to so coarse a variety when transported to sterile clays, we should be exceedingly cautious in using this Grass in laying down pastures. This has been practically brought before me the last three years in observing the behaviour of one of the glades near the entrance of the Earl Bathurst's Park, at Cirencester; this glade was laid down for permanent pasture some few years since, when its Grasses seem to have consisted for the most part of the following species, independent of Clovers:—

Lolium perenne; Perennial Rye.
Poa pratensis; Smooth-stalked Meadow Grass.
„ nemoralis; Wood Meadow Grass.
Festuca duriuscula; Hard Fescue.
„ pratensis; Meadow Fescue.
Dactylis glomerata; Cocksfoot.

Of these, in general, it is only necessary to remark that they are all doing tolerably well; however, as respects the F. pratensis, the few plants of the smaller type are still very coarse, but most of the plants have visibly become coarser and stronger every year, and have now fully taken on the F. elatior form, and more especially along a line where a bed of stiff oolitic clay crops out; here its tussacs are particularly unsightly, as it is designed for lawns, but even for pasture it is so coarse and rigid as to be in itself of little value, and is, indeed, mischievous in occupying so much space, which would be better employed in the growth of Grasses of a finer description.

The other forms of Fescue, namely—

17. Festuca duriuscula; Hard Fescue.
18. „ ovina; Sheep's Fescue.
19. „ rubra; Creeping Fescue.

These three forms, unlike the preceding, have each a tendency to the growth of fine herbage; the leaves of all are exceedingly narrow, and in self-culture it grows in separate tufts, presenting no inclination to form matted turf. I have little doubt as to their being but different forms of one species; at the same time my three plots have to a great extent maintained their specific identity, though the F. rubra does not manifest the slightest disposition to creep, so that if it be true, as stated in the "British Flora," that "its only (specific) character exists in the creeping root,"* our clays will not perfect this variety, the creeping root being its characteristic in sand deposits.

20. *Bromus erectus*, upright brome Grass, gets on very badly in my plot, as there is below it a considerable depth of clay; however it is the commonest Grass on the stone brashes, which produce remarkably fine specimens. In its wild state it may be described as the most common Grass of the Cotswolds, where it descends into the vale; it usually marks the site of *débris* of oolitic gravel, with which the lias clay of the vale is occasionally covered. The B. erectus is a perennial Grass, in which it differs from most, if not all, of our native species. Its agricultural value is practically demonstrated by the disinclination of cattle to eat it and the very poor hay it makes, and it is interesting to find that in the analyses of 20 species of our commoner meadow Grasses by Professor Way, this Grass in the dry state stands seventeenth in its amount of albuminous or flesh-forming principles, being nearly at the bottom of the list, or among the last in point of value.

21, 22. *Lolium perenne* (Perennial Rye-grass) and *Lolium italicum* (Italian Rye-grass), have both done tolerably well in my plots; the annual seeding, however, causes the old plants to periodically die out, but they are replaced by seedlings, by which means the first form is tolerably well maintained from year to year; not, however, the second—as, being a derivative or variety of L. perenne, it has the tendency under such circumstances of growth to revert to the original form, and hence my plot of L. perenne, var. italicum, is fast wearing out, and the bed becoming occupied by the L. perenne, which latter, too, is of the wild rather than the cultivated type.

23. *Triticum caninum* (Fibrous-rooted Couch).—This has been placed under cultivation to show its distinctive characters when compared with the T. repens. The herbage of the Triticums deserves chemical investigation, as they have so peculiar an odour when their leaves are crushed that they may be distinguished by the smell alone; this perhaps arises from the active principles which render it medicinal to dogs, and at the same time causes it to be refused by cattle. This peculiar flavour would appear to belong to the whole genus.

Conclusions.—I have now brought my notes on the experimental plots of the garden of the Royal Agricultural College to a conclusion, or, at least, in so far as they were carried out in the years 1853 and 1854, and I hope not without showing that simple experiments upon the growth of plants are capable, not only of instruction by an examination of the form and method of growth of different species—the original intention,—but that, from time to time, observations may be registered in a garden so simply conducted as our own which may have great influence, not only on theoretical views, but may greatly advance, as all sound theory must, the most approved methods of practice. *Cirencester, Oct.* 21.

* Hooker's "British Flora," 5th edition, p. 399.

CHEDDAR CHEESE MAKING.

(*Continued from p.* 699).

There is an appearance of ease and simplicity about the method of making Cheddar cheese, as we saw it practised in Somersetshire. In the dairies of Mr. Harding and his aunt (at Compton Dando), a regular system is followed; and those undeviating guides, the thermometer and the clock, are frequently referred to in the different stages of the process. The more that a regular system is introduced into the manufacture of cheese—subject to such modifications as the superintendent may occasionally think necessary for varying circumstances—there is the greater probability of obtaining uniform results.

The points of excellence aimed at in these dairies are the manufacture of the best quality of cheese in the most cleanly manner, and with the smallest amount of labour. In their attempt to accomplish this Mr. and Mrs. Harding have been highly successful. In addition to the girls, who do the work of the dairy, several men and boys are employed to milk the 73 cows belonging to Mrs. Harding, at Marksbury. The men carry the milk, but they do not enter the dairy in doing so. It is poured through a sieve into a receiver outside, from which a pipe conveys it through the wall to the cheese tub or to the coolers. A canvass bag is also placed over the inside end of the pipe, so that a double precaution is used against impurities entering with the milk.

The rennet is prepared much in the way that it is done in many Ayrshire dairies. Mrs. Harding steeps five vells at once, and this usually suffices for two weeks, in which time about 21 cwt. of cheese may be made. The vells appear to have been carefully cleaned and preserved. Pure, well flavoured rennet is certainly indispensable to the manufacture of first-class cheese.

Immediately after the morning milking, the evening and morning milk are put together into the tub. The temperature of the whole is brought to 80° by heating a small quantity of the evening milk. Mrs. Harding, who has had long experience in cheese-making, can tell the precise temperature within two or three degrees by merely passing her hand through the milk. Her grandniece, who now relieves her of most of the duty of superintendence, can usually tell very nearly; but even with individuals whose senses are acute there is a liability to deception, from the varying heat of the hand when it is put into the milk, in different states of the weather. The thermometer, therefore, is found to be the surest guide, and it is regularly used.

In spring and towards winter a small quantity of annatto is used to improve the colour of the cheese. It is put into the milk along with the rennet at seven o'clock. After the rennet is added, an hour is requisite for coagulation. At eight o'clock the curd is partially broken, and allowed to subside a few minutes, in order that a small quantity of whey may be drawn off to be heated. This whey is put into a tin vessel and placed in a boiler in an adjoining apartment, to be heated in hot water. The curd is then most carefully and minutely broken—Mrs. Harding and her niece performing this part of the work with utensils called shovel breakers. The servants are never entrusted with this duty. When the curd is completely broken, as much of the heated whey is mixed with it as suffices to raise it to 80°, the temperature at which the rennet was added. Nothing more is done to it for another hour.

A little after nine o'clock the work is resumed. A few pailfuls of whey are drawn off and heated to a higher temperature than at eight o'clock. The curd is then broken as minutely as before, and after this is carefully done, an assistant pours several pailfuls of the heated whey into the mass. During the pouring in of the whey the stirring with the breakers is actively continued, in order to mix the whole regularly, and not to allow any portion of the curd to become overheated. The temperature at this time is raised to 100°, as ascertained by the thermometer, and the stirring is continued a considerable time, until the minutely broken pieces of curd acquire a certain degree of consistency. The curd is then left half an hour to subside.

At the expiry of the half hour the curd has settled to the bottom of the tub. Drawing off the whey is the next operation, and the ease with which it is performed would astonish an Ayrshire dairy manager. The greater proportion of the whey is lifted in a large tin bowl, and poured through a hair sieve into the adjoining coolers. As it runs into the leads it appears to be very pure. When the whey above the mass of curd is thus removed, a spigot is turned at the bottom of the tub, and the remainder is allowed to drain off, which it does very rapidly without any pressure being required. To facilitate this part of the work the tub is made with a convex bottom, and the curd is cut from the sides of the tub and placed on the elevated centre. It is carefully heaped up, and then left for an hour with no other pressure than its own weight. After this interval it is cut across in large slices, turned over once on the centre of the tub, and left in a heap as before for half an hour. The whey drips away towards the sides of the tub, and runs off at the spigot; and no pressure being applied, it continues to come away comparatively pure.

After undergoing these simple and easy manipulations, and lying untouched during the intervals that have been mentioned, the curd is ripe for the application of pressure. But great care is taken not to put it into the vat to be pressed at too high a temperature. If the heat be above 60°, and it usually is higher at this time, the curd is broken a little by the hand and thrown upon a lead cooler, until it is brought down to the desired temperature.

Home Correspondence.

"*Education of the Poor.*"—Your correspondent "Constance" deserves the well wishes of all the friends of progress in her philanthropic endeavour to establish a labourers' improvement society. There is nothing in the present day so lamentable to behold as the benighted condition of the rustic population; they are literally passed over or left far behind in the rapid march of improvement which marks every other class of men. The mechanic of to-day is a different and improved man from his ancestor of 50 years ago; the miner, the collier, and the weaver are all improvements on their prototypes: but the agricultural labourer is the same mechanical being as of old; not all equally stupid, not all slaves to sensual indulgence, which so often lowers man below the beasts that perish; but still in general character little altered from the Saxon swineherd who roamed the forests of Old England in the 13th and 14th centuries. The grossest superstition still exists: in many districts are to be found devout believers in the powers of witchcraft; ghosts and apparitions are quite familiar things. I remember some few years since a blacksmith, not 30 miles from London, persecuted by his neighbours for having bewitched a woman to whom he had kindly carried a portion of his own dinner. The husband swore he would have his life, and his house was continually assailed until the police were called in; the poor fellow told me with tears in his eyes what a wretched life he and his family endured. The benefit would indeed be a great one to the working man if he could be raised above such miserable delusions and placed in the position of an intelligent being. What pleasure might thus be added to his life of toil; how superior such enjoyment to the evanescent delirium which leaves the body weakened, not refreshed; and suppose the mind could contemplate some agreeable recreation, would not the hours of labour be sweetened? A thought of the cheerful room with its blazing fire, its nice books, and amusing yet simple lecture, which were he not ignorant, as he would then know himself to be, he could understand, would surely have a good influence on the man; and if he felt that his employer had contributed to this increase of his happiness, would he not try and make some returns by increased industry in his labour? The opponents of education may sneer, but it

stands to reason, and will, I confidently believe, stand the test of experience, that whatever the occupation may be, the better the education is—and mark, by education I do not refer simply to the arts of reading and writing, but to the far more important training of the moral principles and enlightening of the mind—so much the more fit must the man or woman become to thoroughly carry out any duty that may devolve upon them. Your correspondent asks for information from those acquainted with mechanics' institutes. Because I know something of the latter, I have ventured to reply, not however to hold such institutions up as a guide, but rather to suggest that, as the cases appear to me perfectly different, the same treatment is hardly likely to prove successful. The mechanic, constantly surrounded by his companions (many of whom are far more clever than himself), is ever learning from them. He sees men, formerly as poor as himself, rising to wealth and honour; he thirsts to do likewise—the spirit of self-improvement seizes on him, he will take every opportunity and strain every nerve not to be left behind in the great race which he hourly sees around him. For him the lecture on science is adapted, because he has already, or will hereafter, familiarise himself with the details by reading. He can read a book out of the library with delight, because his mental faculties are quicker than those of the labouring man. The ordinary system in mechanics' institutes provides a good library and reading-room in which the daily papers and magazines can be seen; instruction is communicated principally by lectures and classes, the latter usually conducted by the members alone without extraneous assistance. Such classes commonly comprehend drawing, music (vocal and instrumental), the reading of original essays, and meetings for debate on given subjects of general interest. A writing class is often not required. Now it would of course be utterly absurd to attempt anything of this sort in a society where many of the members could neither read nor write. It is evident in such a case we must begin at the beginning and set them down to straight strokes and the alphabet, and indeed have all the drudgery of school days over again, with those whose minds are much more stupid and fingers much less pliable than when young. This will be indeed a work requiring great patience and untiring energy. Moreover, judgment must be exercised to guard against the pupils becoming weary and giving up after the first few meetings. Vary the occupation as much as possible, limit each lesson to a very short period, especially at first, until a love for the pursuit itself is engendered, when it does not matter how long a time is allowed. For instance, writing might be the first employment, say for a quarter of an hour; then should follow some simple discourse upon common things. The party who visits the room might have a rude map of the world on a large scale, which, hung up in a conspicuous position, would form the subject of numerous interesting lectures. The nature of the earth, the minerals it contains, mines, and anecdotes about mines, &c., would all form topics for discussion, which could not but interest and enlighten the members. This would occupy another quarter to half hour, when might follow the reading classes, and in this or a similar manner the evening would pass very pleasantly; music should not be omitted, as it has a softening influence upon even the coarsest material. All lectures should, where they will bear it, be copiously illustrated with large diagrams. If arithmetic is attempted, it should be taught orally; a teacher and class, with a black board, will get on far better than slates for each, as under the latter plan they would soon go off to sleep. Drowsiness will be a great enemy; that must be done battle with by awakening the interest so far as to overcome the fatigue of the body—the habit once acquired, attention becomes easy. The task which Constance so kindly proposes to herself is one of no ordinary magnitude, and before fairly embarking in it she will do well to count the cost and all the difficulties which will surround her. Much time must be devoted, many other things laid aside, if she would be successful. In order that the society may prosper there must be a leading mind directing everything. Having once decided to make the attempt, let the resolution be firm not to be easily discouraged—not to expect too much at first—to be satisfied with very small things, so long as there is evident progress; and, above all, let the mind be fully prepared to carry through thoroughly whatever it undertakes, otherwise I much fear that, like many similar societies, it will, after a flourishing commencing, rapidly decline, and finally disappear in the mists of ignorance which will ever assail it. *C.*

Breeding of Stock.—In reply to "J. L.'s" enquiry, I beg to state that I do not keep horned stock for breeding. I replenish my dairy stock by purchase, so as to keep up my quantity of milk at 110 to 120 quarts per day. I sell my calves when a few days old. My food is intended to induce the greatest yield of milk, and to maintain and improve the condition of the animals. I frequently purchase "strippers," cows which are sold by other dairy keepers on account of their giving too little milk. After these have been for a week or two under my treatment, their produce of milk increases I may say invariably to the extent of 1½ to 2 quarts per day. As my practice combines milking and feeding, I continue to milk to a much lower produce than those who keep for dairy purposes solely. From six weeks to two months suffice after the cows are quite dry to fit them for market. *Y.*

Reigate Penny Savings Bank.—The managers of the Penny Savings Bank at Reigate have the pleasure to present to their young friends, the depositors, a summary of receipts and payments for the first year—that is to say, from the 4th of September, 1852, to the 3d September, 1853, inclusive. The managers hope that the operation of this little institution will be considered to have been very satisfactory; and to afford every encouragement to their youthful depositors to persevere in their highly useful and meritorious habit of saving their small sums of money, and bringing them for safe keeping and for accumulation to the Penny Bank. The managers are clearly of opinion that all children and young people having pence to spare should become depositors; and that it may be considered to be an indispensable as well as a pleasing duty on the part of parents to encourage in their children the invaluable habit of saving. It is of the greatest importance to establish good habits while their children are young; one of the chief of which may be considered to be the habit of saving their money.

Statement of Receipts and Payments from the 4th September, 1852, to 3d September, 1853, inclusive.

Examined and found correct, GEORGE BAKER, *Auditor*; THOMAS MARTIN, *Treasurer*; GEORGE GOODCHILD, Jun., *Secretary*.—8th September, 1853.

Thick and Thin Seeding.—With all due deference to our friend Mr. Goodiff, of Granard, allow us to notice that in his observations last week, in reference to our planting Wheat at 1 foot apart, or about 6 pints per acre, that we "challenge the United Kingdom to produce so good a crop as ours." He ought to have added the whole sentence, viz., "from their 192 pints or 3 bushels of seed per acre," or a wrong construction may be put upon it altogether. All we meant to convey from it was, that a greater crop has been grown by us, and can be by others, if they choose to take the same trouble, from 6 pints per acre, than it is possible can be by any body else at the opposite extreme, 32 times as much, 192 pints, or 3 bushels per acre, admitting all the seed to grow, as it too often does, in ordinary course. *Hardy and Son, Maldon, Essex.*

Adulteration of Manure.—Your exertions to bring to light the adulterations which are constantly taking place in manures, seem to have called forth your remarks upon the yellow ochre (or in other words common loam not worth 1*s.* per ton) deposited in the warehouse lately blown up by the explosion at Gateshead. You blame the manure-makers, but you must not except the buyers. The worst and best manure in the kingdom is manufactured in this neighbourhood, but the worst has had buyers when the best has had few; such expositions as you furnish tend to place things in a better position; but farmers are always beset with small-saving and penny-wise and pound-foolish ideas, and notwithstanding your exertions, along with those of many other enlightened men, to improve their condition, are still prone to buy any rubbish if the figure is only low. The Royal Agricultural Society is not free from this, when they offer a prize of 1000*l.* for a manure at 5*l.* equal to another at 10*l.* If the history of the loam above-named was gone into, I suspect it would tell a dismal tale. If there were no receivers of stolen goods there would be few thieves—if there were no buyers of spurious manures there would be no makers. As long as the agriculturists allow themselves to be cheated—and millions have been wasted on bad manures—so long will there be plenty ready to cheat them. I hope your frequent expositions and their increasing knowledge may at last be excited to a good purpose. *A Member of the Newcastle-on-Tyne Farmers' Club.*

The Harvest and its Results.—Every one had anticipated a cheap loaf—a great blessing in every respect; but the disappointment has been more than proportionate, especially as the prices of most articles in general consumption (coals among the rest) have been already advanced, just at a period when approaching winter tends much to aggravate the evil. Surprise is expressed by all; and even the writers of agricultural periodicals appear to be equally perplexed. In order to throw some light upon a subject so involved, I venture to extract the following passage from a letter just received from Scotland, written by a gentleman who may be justly esteemed one of the first authorities of the day:—"The present high prices of grain, after a bountiful harvest, arise from that harvest following a year of scarcity. The farmers having to secure their crop, to take up their Potatoes, and to plough their Bean and Potato land for Wheat, have no time to thresh out their stacks of grain; and the wants of the people depending upon the new crop (the old one having been entirely exhausted), there has not been time to supply their demands. Add to this, the demand of France for our grain at a time when there is no water or wind to assist the French to thresh out their own abundant crop; there being no steam-power used on farms in France, they are entirely dependent on wind and water. The prices must fall whenever rain falls, and the farmers have leisure; but they will not be low this season, because we have begun to consume our new crop at once; and should the next harvest be a late one, this crop, abundant as it is, may still be too short for our support. The rule of France being arbitrary, she comes into our market and buys up all the flour our steam machinery can make; and our millers do not care whether or not our people eat dear bread, provided they can dispose of their flour at a higher rate to a foreign country. We have had no rain here, to speak of, since the harvest, and the ground is so dry as to prevent the sowing of Wheat." More might be added, as the recent French enactments must tend to complicate the present difficulty. *J. T.*

On Premiums to Farmers.—I quite coincide with the opinion of your correspondent "J. M.," that self-interest is the inducement to contend for premiums; and, further, that the majority of competitors consist of landlords, stock-breeders, and agricultural implement-makers, These show the best of their race and kind, but often at an expense that does not suit an ordinary farmer—profit and not fame is what he requires. He no doubt often attends, and glances over those fashionable exhibitions, tries to guess at the value of the prize stock, and the cost of production; and this is the most benefit such a man derives, bound, as he too often is, by a short tenancy and the custom of the country. In a fair or market he could do this with more satisfaction. I would therefore suggest that premiums be awarded to landlords who have learned and can show the philosophy of growing, if not 25 tons of hay an acre, at least double the quantity usually produced in the neighbourhood. To the tenant whose landlord enabled him to do this with security, I would also give a premium. The kind and quality of stock, &c., best suited to each district and party would be got without the assistance of premiums. *W. H., Tyneside.*

Economy in the Consumption of the Turnip Crop, by Using the Turnip Cutter.—In a season like the present, when the yield of Turnips is deficient in many parts of Great Britain, the following extracts will be found more than ordinarily interesting:—From Mr. Pusey's Reports, in the Royal Agricultural Society's Journal. Article, by Mr. Pusey, on "English Agriculture," 1840.—"The advantage (of using the Turnip-cutter) is twofold; saving the teeth of old ewes, for which the Swedish Turnips especially are too hard; saving the waste of this valuable root, which, where partially scooped out by the sheep, is rolled and trampled about with great waste. The economy effected by this machine has been stated to be no less than one-third of the whole produce. If it be taken, however, at only a fourth or fifth, why, it may be asked, has not every farm in the country been long since furnished with this cheap apparatus?"—Mr. Pusey's Paper "On the Progress of Agricultural Knowledge during the last Eight Years." Royal Agricultural Society's Journal, 1850, page 430. "I have endeavoured to ascertain the profit of Turnip-cutting. If, of two lots of lambs, the one received, during winter, cut Turnips, the other uncut Turnips, the fold with cut Turnips would be worth 20 per cent. more than the other fold. The former would sell for 40*s.* a head if the latter fetched 32*s.*, and the cost of cutting would be 1*s.* per head, leaving 7*s.* clear profit upon one sheep. If this statement had been made by an amateur agriculturist, one would have been rather sceptical. It was given to me word for word by two experienced practical farmers; and I only write it down from their mouths for the consideration of their brethren in any benighted districts of England, or even Scotland, if such yet there be. Let them consider that 7*s.* per sheep upon Turnips comes to 70*s.* per acre upon the Turnip crop, nearly the average rent of land for the four years' course till the Turnip comes round again. And what is the investment of capital? 5*l.* for one best Banbury Turnip-cutter, which will last for five years. We ought to hear no more of the extravagance of high farming. Your real spendthrift farmer is the man—penny-wise and pound-foolish—who gives whole Turnips to his tegs."—Extract from W. Dickinson's Report "On the Farming of Cumberland." Prize Report, Royal Agricultural Society's Journal, 1852, page 229. "Large quantities of Turnips are now consumed on the ground by sheep and some by cattle; a few are at the pains of having Turnips cut for lambs and young sheep, given them in troughs, and find great benefit from it, as the sheep thrive better, and leave little or no waste of the roots. In consuming roots on the ground in the green state, or drawn and given loose on the greensward, the waste of Turnip shells and skins amounts to as much as the cost of cutting, and the sheep seldom do as well."—Extract from Morton's Cyclopædia of Agriculture. Article, "Turnip-cutters," page 1030. "For cattle, too," [as well as for sheep,] "the advantage and indeed the need of cutting roots, is obvious to any one who has seen an ox trying to master a whole Turnip in his mouth at once, with outstretched neck, and energetic tongue, and slavering mouth.—*From a Correspondent.*

A Well-managed Benefit Club.—An enumeration of some of the advantages attending membership in this newly established Friendly or Benefit Society. 1. The perfect safety of the capital stock of the club; from its being invested in the government securities, and the rules and tables having been approved and enrolled by the proper authorities according to Act of Parliament. 2. The entire amount of the monies subscribed by members will be devoted to their benefit in sickness and infirmity; and, in old age, when the weakness and inability to work attending an advanced period of life will render such a provision as this society will afford, so valuable. 3. This society affords also an opportunity of

providing an endowment for a child, to be available at 14 or 21 years of age, as an apprentice fee, or other beneficial application of the amount subscribed for. 4. The monthly contributions are regulated according to the weekly allowances in sickness subscribed for, at the discretion of the insurer, varying from 2*s.* to 10*s.* per week; and the weekly allowances in old age, whether sick or well, may be from 1*s.* to 5*s.* per week for the remaining duration of life. Or, members may subscribe for pay in sickness during life, without any superannuation allowance. The endowment for children may be from 10*l.* to 20*l.*, payable at 14 or 21. 5. All the expenses of management will be defrayed by the subscriptions of the honorary members—those who will receive no benefit from the funds; and the surplus of such subscriptions will be applied in aid of the benefit fund. 6. By membership in this society, habits of economy, forethought, sobriety, and industry, qualities so essential to the comfort and happiness of families, as well as of individuals, are essentially promoted. The friends and supporters of this club therefore look forward with an assured confidence to its stability and permanency. They know that it has in its composition all the elements of usefulness and of a beneficent career, so as to become a comfort and a blessing to those who, by their prudence, economy, and forethought, are induced to become members of it. The young people of both sexes of —— and its neighbourhood, from 15 years of age, upwards, are therefore strongly invited to join the society. [This is the prospectus of the Reigate Victoria Club.]

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Monthly Council, *Nov.* 1.—Mr. Miles, M.P., president, in the chair. The names of 35 candidates for election at the next meeting were read.

Finances.—Mr. Raymond Barker, chairman of the Finance Committee, presented the report on the accounts, along with the usual quarterly balance-sheet under each head. The current cash-balance in the hands of the Society was 471*l.* Mr. Fisher Hobbs having called the attention of the Council to the amount of unpaid subscriptions, it was ordered, on the motion of Sir John Shelley, that lists of all the members in arrear should be prepared, and suspended in the Council-room.

Lincoln Meeting.—On the recommendation of the Finance Committee, a vote of thanks was unanimously passed to Messrs. Smith, Ellison, and Co., of the Old Bank, Lincoln, for the accuracy and courtesy with which they had acted as the local bankers of the Society during the period of the Lincoln Meeting. Mr. Raymond Barker, as Steward of Admissions and Receipts at the Show-yard during the Lincoln Meeting, made a very satisfactory report of the operations of that department, in which occurs the following passage, bearing testimony to the admirable conduct of Inspector Teddy, of the A Division of Metropolitan Police and the men under his charge, sent to the Lincoln Meeting by the Commissioners of Police, by direction of Viscount Palmerston, on the representation of the Society:—

"To the unwearied attention and exertions of Inspector Teddy, the head of the Police establishment alone, was the steward indebted for the continuous and rapid interchange of cash which afforded all requisite accommodation to the public, while it successfully obviated all grounds for complaint or delay; when it is considered that during several portions of the principal day the influx through the barriers was at the rate of quite 30 per minute, much credit must be allowed to the police for the vigilance and good temper with which they discharged their arduous duties."

On the motion of Mr. Fisher Hobbs, it was ordered "That a complete balance-sheet of the Country Meeting of each year shall in future appear in the last Journal of the Society for the same year."—Mr. Barnett, as senior steward of cattle at the Lincoln meeting, made the first report of that department, which was adopted by the Council.

Carlisle Meeting.—The agreement entered into by the Secretary with the authorities of Carlisle was laid before the Council, who ordered the great seal of the Society to be affixed to it.—Mr. Fisher Hobbs, as senior steward for the Carlisle meeting, reported that instructions had been duly given to the Local Committee in reference to the preparation of the land for the trial of implements next year. Suggestions from the local committee for special prizes to be offered for particular breeds of cattle at the Carlisle Meeting were referred to the special Council on the 7th of December, when the Stock Prize List for 1855 would be taken into consideration.

Member of Council.—On the motion of Mr. Raymond Barker, seconded by Mr. Fisher Hobbs, the Earl of Darnely, of Cobham Park, Kent, was unanimously elected a member of the Council, to supply the vacancy occasioned by the decease of Mr. French Burke.

The President reported to the Council the steps he had taken during the recess, in reference to important communications received by the Society from Viscount Palmerston, as well as to various letters addressed to him from abroad. He also called their attention to the great mass of evidence which the Earl of Clarendon had so kindly been the means of obtaining for the Society, in reference to the occurrence of guano and the nitrates in tropical regions, and which the President had no doubt would eventually lead to important results of a commercial, as well as of an agricultural character.—A splendid collection of agricultural works, published in France under the inspection of the minister of that department, was received by the Council as a present to the Society from the French Government, and an unanimous vote of the best thanks of the Council ordered to be returned in acknowledgment.—A present of agricultural works was also received through the Smithsonian Institute of the United States, from that body and individual authors, for which the best thanks of the Council were ordered.—Miss Banister, of Steyning, transmitted a large collection of specimens and models, with explanations, connected with Grass cultivation and products, cottages, &c., which were ordered to lie on the table for the inspection of the members.—Professor Solly had leave to exhibit at the Trade Museum, for a certain period, the Society's collection of German wools, presented to it by the Mecklenburg growers.—Mr. Farmer, of West Canada, applied for information on the question of standard "points" of excellence in prize cattle.—Mr. Ruck and Mr. Lawrence transmitted communications on the subject of selecting judges for Cotswold sheep, which were ordered to be reserved until the date when the Council would take the question of the selection of judges for the Carlisle meeting into consideration.—The Ledbury Society addressed the Council on disputed points in adjudicating prizes for live stock.—Various communications were received connected with the subject of offering foreign threshing-machines for trial in England without expense to the farmer, placing manure-steeps and syrups for seed-grain at the disposal of farmers for trial, and establishing in this country and in France large manufactories of fish-offal manure.—Colonel Warrington submitted a claim of reward for his new guano.—Col. Clinton suggested a prize for a machine for separating the ears of corn.—The Hull Chamber of Commerce requested information on the best means of "treating the refuse of the Hemp-plant, in order to fit it for the soil again, apart from the usual farm-yard process."—Mr. Roch presented, for adoption by the Society, a new form of journalising farm-accounts under required heads, in the most simple and intelligent manner.

Adjourned to Dec. 6.

Braintree and Bocking.—The annual meeting of this society was held on Thursday, the 19th ult. The following is extracted from Mr. Mechi's address on the occasion:—Mr. Mechi said that somehow or other, however disagreeable his principles might be to some, he generally found that, personally, he was well received. It was so throughout the country; and where he had thought he should be torn to pieces in some of the most prejudiced districts of England, he had always received the greatest personal kindness. He agreed with Sir John Page Wood that these meetings were hardly practical enough. To bring forward the business of agriculture they should have a club-room in this town, in which the farmers might meet and discuss the great principles of agriculture. This was done in commerce and manufactures: they could not go into a large town but there was either a Chamber of Commerce or some other particular place where the interests of trade and manufactures were discussed. Such then ought to be the case with agriculture. Now, suppose this town were at this moment discussing how they were to proceed with their Board of Health—how to dispose of the good things they ate and drank, collected together as sewerage, so as to connect sanitary improvement with the good of agriculture. If the farmers after market would meet here the tradesmen and authorities of the town, it would very much facilitate the transmission of the good things of this town to the fructification of the soil. The great question of the day was the question of manure. There was not a farmer who did not tell them that he could not produce a great deal more beef and mutton, and a great deal more corn, if he could obtain more manure. Let them therefore look to the sources from which it could be obtained. This was not, mind, a theoretical question. He had a letter from his friend Mr. Walker, of Rugby, who had taken all the good things from the people of that town, and, by the process by which it was carried on to the land, the sewerage of the town was forming food for the people in the course of something like 24 hours. Now they had 8000 or 9000 people in these two towns; and he asked them, would not the manure of that number of sheep place any farmer in this neighbourhood in a much better position? He should like to ask Mr. Hobbs at what he valued the manure of one sheep per year? Mr. Hobbs said he did not know. Mr. Mechi: Is it 5*s.* a-year? Several gentlemen replied "Yes," and some said more. Mr. Mechi: Then, if they had 8000 people, it would be worth 400*l.* at 1*s.* per head; at 6*s.*, 2400*l.*; or at 5*s.*, 2000*l.* Now, he was told he was a visionary man; but what he complained of was, that the farmers did not keep proper accounts. Mr. Walker had bought the manure of these 8000 people of Rugby for 50*l.* a-year, under a lease of 21 years; and he (Mr. Mechi) hoped they had some calculating man amongst them here who would follow his example, and take the manure of Braintree, but not the manure only—the water also. At Rugby they had 150,000 gallons of water per day used, and Mr. Walker therefore not only got the sewage of Rugby, but 150,000 gallons of water a day to mix with it. Now, so important was this mixture, that Mr. Telfer, of Ayr, writing to him (Mr. Mechi) yesterday, said that he had put on guano in dry weather, and had watered one part and left the other unwatered; and the difference was 75 per cent. against that which had not been washed in. Now, if this could be brought home to the farmers, he knew there was no class of men so keen as to the pounds and shillings as the farmers of England. If they were all agreed that a sheep's manure was worth 5*s.* or 6*s.* a year, that of a man must be much more valuable. So much for this subject, and it was a great one. They should, he hoped, no longer permit that the good things of this world should flow down their rivers while they were crying out for guano from Peru. Then it was asked "where is the money to come from?" A man of his (Mr. Mechi's) acquaintance, who said so three years ago, had now found 300*l.* to buy a steam-engine. (Hear.) Landlords had said they could not put up covered buildings; but when they came to learn that they were for the benefit of both landlord and tenant, they would put them up. The most difficult lands in this country to manage were those on which they could not keep sheep in the winter; but if gentlemen occupying such land had a covered yard and boarded floor, to which their animals could be brought home in wet or severe weather for a few days, eating straw and so on, there would be no hindrance to their keeping stock, because they had the opportunity of turning them out in the day time and bringing them home at night to warmth and cover. He contended that it would pay both the landlord and tenant to make the necessary outlay for putting up covered buildings. In winter the days were short and the nights long, and the sheep could not feed after about four o'clock; and how could they be expected to thrive if left all night on the cold, wet clay. He said they were not calculating men as farmers. They did not calculate the fractional parts of the cost of the articles they had to produce—they did not know where the shoe pinched. The object was to correct these errors, and he believed the time was coming when, as the manufacturer calculated the disposition of his capital—how much went for the material, how much for labour, and how much for bad debts—so the farmer would calculate how much went for every pound of mutton he made. Though he was considered theoretical, he had gone into accounts sufficiently to know that farming was a very slow business—(hear and laughter)—and that it always would be, as compared with other pursuits. It was very fortunate it was so, because, if it were not, they would not have any towns; they would not find any population ready to forsake the beauties of nature, and the happiness of life, for constant attention to a town life, only that it was known the business of the town was more profitable. Then they must seek to make agriculture more profitable. When they found a man putting on 20*l.* worth of manure to an acre, and saw the effect of the rents, tithes, and other irremovable taxes upon the small producer, it was impossible the latter could compete with the man of capital who could do that. Agriculture could not remain as it was. They were now 23 millions in population, and their next "double" would make them 46 millions; consequently they would have to employ the additional number of people, and double the amount of their production. There was one other thing he should mention: it was exceedingly gratifying to him to see a large improvement in the housing of agricultural labourers. It was no use mincing the matter, but they were justified in getting out of their labourers all the work that they could in a proper manner; and if they had four miles to walk to and from their work every day, how materially must that lessen their capacity for work? Would any farmer think of sending his horses that distance, and was not the muscular power of the labourer of as much importance as that of the horse? He hoped that landlords, being no longer tempted by a particular law of settlement, would erect cottages on their estates, so that the men could have ready access to their work. Then their mechanics enjoyed the advantages of literary institutions, of reading rooms, and museums; and why had not the agricultural labourer the same advantage? He would suggest that they establish reading-rooms in their several parishes, supplied with papers which they themselves had done with the day before; so that the labourer might read the spirit-stirring articles on the battle of the Alma, instead of retiring to his home like his pigs, with his mind wholly unenlightened. These were things which he (Mr. Mechi) saw coming in the distance. He took for his guide a great principle. Let him have his basis in that great principle, and he threw his miscalculation to the winds. (Cheers.) Mr. Mechi having resumed his seat, Sir J. P. Wood said he should like to ask his friend what, in his opinion, was the relative advantage of agriculture and commerce?—Mr. Mechi: I suppose my friend Sir John means which do I get the most money by?—Sir J. P. Wood: No, not at all; your general opinion?—Mr. Mechi must tell them, individually, of course his town business paid him much better in proportion than his country one. And why? Because he could make more returns in the year. He could concentrate a larger capital in the year. He paid rent on one of his houses at the rate of 200,000*l.* an acre; and the farmers must do as they in towns did—cram the smallest piece of ground with all the capital they could. Now, the farmers had certain fixed charges—their horse and manual labour, &c., came to 4*l.* an acre, and that was a heavy charge upon a 4*l.* 10*s.* or 5*l.* return, which was the utmost realised. What they did in towns was to cram the capital in the smallest possible space, so that the fixed charge should become as small as possible. He was asked the question the other day "How many farmers failed out of 100—do not 50 go out without their money?" He (Mr. Mechi) said that it was more than 50; and, although it had been the fashion to laugh at those who came out of towns to farm, he would

say, "take care to get as many of them and with as much money as you can." How many people had felt the benefit of the thousands he (Mr. Mechi) had spent at Tiptree? Let them get all the men of money they could to farm, for the effect was to give the labourer more work, to lessen the rates, and generally to elevate the principles and views of those whom they came amongst. He concluded by drinking "Success to agriculture."—Mr. Raven, who observed that in reference to what Mr. Mechi had said about reading-rooms for the labourers, he (Mr. Raven) had himself opened one in his own parish; but he was sorry to say it was very little attended. The first question put to him was, "Have you got a pint of beer for me? then I'll come." Generally speaking, however, he found these men were not educated at all—(hear)—and they must look forward to the time when there would be a great spread of education amongst these classes. (Hear.)—Mr. Mechi said he had a curious fact to notice. After having exhausted the greater quantity of liquid manure from his tank, he thought they might clean out the solid matter and put it on to the Mangold Wurzel; and to show that the liquid manure was the more efficacious, there was no crop in comparison with other parts at which the liquid manure had been applied. He mentioned this in order that there should not be allowed so large an escape of manure from their yards as they sometimes saw.

CHEMICO-AGRICULTURAL OF ULSTER, *Oct.* 29.—Dr. Hodges exhibited an analysis of some soil from Lois-Weedon, where, he said, he had been informed, nine successive crops of Oats had been grown without manure, and the last was stated to be more abundant than the first. He regretted that neither Mr. Paul M'Henry, who was acquainted with the soil, nor Mr. Caldwell, who had visited Lois-Weedon, and had grown a crop according to Mr. Smith's instructions, were present. Dr. Hodges remarked, in reference to the composition of the Lois-Weedon subsoil, that it was rich in lime, and very different from the soils in Down and Antrim, upon which he considered that the plan of cultivation recommended by the modern disciples of Jethro Tull would, in a much shorter period, produce exhaustion. Some exceptional soils, even in the north of Ireland, were not easily wrought out; and, as an example of these naturally rich soils, he instanced the case of fields adjoining some old religious establishments which were so well stored, from various causes, with the elements of fertility that, year after year, they gave abundant crops without the application of manure. He trusted that Mr. Caldwell would give the Society an account of his experiments.

Reviews.

Moubray's Treatise on Domestic and Ornamental Poultry, &c. A new edition by L. A. Meall. Virtue. 12mo. pp. 504.

THAT Moubray's poultry book is that which best suits the wants and taste of poultry breeders seems sufficiently shown by its having passed through nine editions in its original form. It is, however, undeniable that Mr. Meall has much improved it without diminishing its utility. He appears to be familiar with his subject, and to possess the tact to know when he has said enough. The work is embellished with nine coloured plates, representing faithfully, not extravagantly, some 34 different races of poultry.

Having spoken thus favourably of the work before us, we must bring under the notice of our readers the following statement, which Mr. Meall makes for the purpose of indicating how large a part the breeding of poultry may form among the minor sources of a nation's wealth:—

"The poultry markets of London are Newgate and Leadenhall,—the latter being the largest in the world, and about two-thirds of the whole number of fowls sold in London are vended there. According to Mr. Mayhew, in his work already referred to, the total number of fowls sold annually in the above markets is estimated as follows:—

POULTRY SOLD AT NEWGATE AND LEADENHALL MARKETS.

	ALIVE.	DEAD.	TOTAL.
Game, &c.	...	910,000	910,000
Domestic Fowls	60,000	1,756,000	1,816,000
Geese	...	1,002,000	1,002,000
Ducks	40,000	383,000	423,000
Turkeys	...	124,000	124,000
Pigeons	...	383,000	383,000
Total	100,000	4,558,000	4,658,000

"To the above may be added about 350,000 heads sold by the poulterers and shopkeepers, making a total of about five millions of birds, wild and domestic.

"Eggs also constitute a by no means unimportant article of commerce. The largest supplies to the English markets are obtained from Ireland: from which country the annual exports of eggs, according to official returns, amounted in 1835 to seventy-two millions; but now it is estimated that we yearly receive one hundred and fifty millions. Of this number London and Liverpool respectively consume twenty-five millions each.

"The chief imports from the continent are from France, some from Holland and Belgium, and occasionally from Spain and Portugal. Half of this supply is taken off by the consumption of the metropolis. Besides being valuable as an article of food, eggs are largely employed in the manufacture or dressing of kid gloves, the yolks being used to soften the leather: in this way upwards of 30,000 eggs are annually consumed in one large glove factory at Bermondsey; the eggs when imported being placed in lime water, by which they are kept good for use a whole twelvemonths. From the returns of the Board of Trade, it appears that the *average* number of eggs *annually* imported and entered for home consumption in Great Britain, during the period ending 1828 to 1832, was 61,431,062; from 1833 to 1837, it was 68,493,516; and from 1838 to 1842, the average reached 91,393,732: since which the yearly imports have been as follow:—

1843	... ...	70,415,931	1848	... ...	88,091,277
1844	... ...	67,565,167	1849	... ...	97,884,557
1845	... ...	75,627,362	1850	... ...	105,780,540
1846	... ...	72,299,487	1851	... ...	115,524,243
1847	... ...	77,542,311	1852	... ...	108,320,490

Whilst in the five months ending May 1853, the number entered for consumption has amounted to 51,694,026, showing a diminution in comparison with former years. The weight of the annual imports is about 4500 tons; and the value of the same reckoned at only 4*d.* per dozen eggs will be 150,000*l.* which would be very considerably enhanced if we added the extra charges for freight, duty, &c.

"More insignificant, though scarcely less necessary, articles of commerce in connection with poultry are the feathers and down. From the earliest times they have been eagerly collected and sought after to furnish the luxury of soft couches and beds: and under the reign of Henry VI. their value caused them to become the subject of a statute or enactment. At the present day the down and feathers of ducks, pigeons, and partridges are used in France for pillows and mattresses. In the Lincolnshire fens, where goose-rearing is very extensively carried on, the feathers are considered most valuable; as for stuffing beds those of geese are esteemed more suitable than others. Whether from increasing desire for luxuries, or the diminution in supply, or from both causes co-operating, the demand is obliged to be supplied by importation; and the value has consequently been maintained, and indeed increased. The down of the Eider duck is collected in very considerable quantities by the inhabitants on the coast of Sweden and Iceland, where the fowls locate themselves in great numbers. The Eider down (of which each duck yields about 1 lb.) is rendered so valuable by its lightness and elasticity, which is so superior, that 2 or 3 lbs., whilst capable of being compressed into a ball a man might hold in his hand, are sufficient to fill a foot mattress for a bed. The declared value of foreign feathers imported into this country

In 1846 was	£5279	In 1848 was	£4680
1847	4237	1849	5096

Messrs. Hering of London have recently introduced, and successfully, the purification of feathers, on an extensive scale, by steam machinery."

We must not omit to add that this edition contains a very valuable treatise on Poultry diseases by Dr. Horner, who has taken up the subject in the spirit of an enlightened and experienced practitioner, and has thus, we trust, put an end for ever to the absurdities of the quacks in whom our country friends have too often been obliged to place their trust. The views taken by Dr. Horner are thus explained by himself, and will, we trust, lead to a careful study of the copious practical instructions which he has given in addition.

"The treatment of the diseases of poultry has ever been chiefly empirical; and at the present day, nostrums and specifics to cure all their disorders are continually being set forth. Moubray has observed, with much severity and truth, that 'the far greater part of that grave and plausible account of diseases and remedies, which is to be found in our common cattle and poultry books, is a farrago of sheer absurdity; the chief ground of which, it is to be apprehended, is random and ignorant guess-work.' The attempt has, however, been made by some recent writers, to describe the diseases of fowls more scientifically: and doubtless they have rendered very great service; yet, it must be conceded, that sometimes, in their advocacy of new views and the application of some remedies, their efforts do but teach us how especially watchful we ought to be, that, in treating of the diseases of poultry scientifically, we do not, at the same time, do so irrationally.

"The great source of error arises from disregard of the important fact, that there is a vast and intrinsic difference between the constitution of fowls and that of man;—not only in the structural or anatomical, but also in the functional conditions of the great organs of their bodies, and especially in those of digestion and of respiration, as well as of the skin. Indeed, the function and condition of the skin of fowls bears no analogy to that of man. In him, it not only exercises most important influence in health, but in disease it oft is the great medium by which medicines effect relief. Hence it follows, that the action of a certain class of medicines on fowls must be negative. Yet we read, that certain drugs are recommended and administered to fowls, which, if there be any truth in the position just advanced, cannot exert upon them that action or effect which they do on man, when afflicted with similar disease of the same parts.

"It is not enough that we possess a knowledge of the medicinal powers of a drug, when applied to the diseases of man; nor even, that we are acquainted with the real nature of the disease with which a fowl is afflicted: the important consideration still remains, how far the anatomical and functional peculiarities of parts or organs will modify or change, will increase or (may be) wholly negative, the action of a medicine on their so differently constituted bodies.

"Let us take an example. The tartrate of antimony (tartar emetic) has, by recent writers, been much commended in some inflammatory diseases of fowls,—as in inflammation of the windpipe, and also of the lungs. It is well known, however, that much of this drug's beneficial effect in those diseases of man, is attributable to its action on the skin—to its inducing perspiration, or promoting expectoration; and thereby affording relief to the oppressed internal parts. As the skin of fowls, however covered with feathers, does not perspire—as fowls do not expectorate, as man does—reason tells us, that there can be no identity or true relation in the curative action of the medicine. We do but witness the anomaly of a drug being administered, that cannot exert on fowls those very influences, on which, in man, its efficacy so greatly depends.

"Again, when we consider what may be termed the triple organs of digestion in fowls—the crop, the fore-stomach, and the gizzard; or, in plain explanatory language, the steeping vats and the mill; organs possessed of such power, that the most heterogeneous substances, as hard grain, seeds, Grass, and vegetables, worms, insects, &c., are readily reduced and converted thereby into one homogeneous mass of food; we may easily conceive that some drugs also may undergo in the stomachs of fowls such amalgamation, trituration, and essential change, as greatly to modify or obtund their medicinal effects. Repeated experiment has, indeed, shown to me that such is truly the case, the results being, in some instances, as extraordinary as they ought to be instructive. A few of the most remarkable only will in the briefest manner be alluded to; and those drugs selected, whose action on the human body is constant and well ascertained.

"Five-grain doses of Turkey opium (more than a quarter of an ounce of laudanum) had no effect whatever on Polish hens. Eight grains (half an ounce of laudanum) were then given to Cochin China hens, without any effect. Lastly, sixteen-grain doses (equal to one ounce of laudanum) were given to each of two Cochin China hens; the one which had a young brood of chickens, was observed to brood them for a longer interval than usual, and appeared somewhat dull for four hours, but she at once made off with her chickens upon being approached; the other was not perceptibly affected, and both took food as usual. The Cochin China with chickens was observed to be briskly purged by the dose; in the other, there was no difference in this respect; and in none of the cases were the bowels at all constipated. An ounce of laudanum would certainly be a poisonous dose for a man; in many instances, half an ounce would be the same. Hens are not the only creatures that are so insensible to the effects of opium; a rabbit, physiologists tell us, will take as much with impunity as would prove fatal to a dog.

"Twenty grains of ipecacuanha (an emetic dose for a man) were given to Polish hens; they ate as usual throughout the day, and were lively; the bowels were slightly purged—no other effect whatever was witnessed.

"Twenty grains of catechu, a powerful astringent, and the full usual dose, had no effect on the bowels of fowls.

"Tartar emetic in two-grain doses had no effect on Polish hens, the birds taking their food as usual. (One grain is the usual emetic dose for man.) In five-grain doses it affected the bowels, and food was refused. In ten-grain doses it acted as a brisk purgative, and all food was refused for a few hours. The same large doses of ten grains were then given to a Game and to a Cochin China hen, which had just been purposely fed with Barley; the digestion of the food was arrested, and both the fowls were seriously affected with spasm, the head in one case being drawn to one side; they were with difficulty recovered. These two examples are instructive: showing, that the crop, being full of grain, the irritant effects of the tartar emetic could not then be negatived by the secretions and actions of the digestive organs. Ten grains of tartar emetic would certainly produce inflammation, and probably death, in man, if it were not previously rejected by vomiting.

"Five grains of arsenic, and five grains of corrosive sublimate of mercury, were severally given to Polish hens without any effect; except that, like the tartar emetic, these most poisonous minerals passed off innocuously by the bowels. The sixteenth part of a grain is the usual dose for man. Calomel, even in doses of 20 grains, does not act severely on the bowels of poultry; but in doses of four or five grains its aperient action is discernible.

"These experiments are suggestive of many practical points; and show, 1st, that if such powerful drugs have so little or even no effect on poultry, even in doses which are poisonous to man, it is highly questionable whether they can be beneficially employed at all, in the cure of their diseases. 2d, that, in the comparatively minute doses, in which some of them have been frequently recommended by recent writers, they cannot, in reality, exert that curative agency which has, unwittingly, been attributed to them. 3d, that the mere size of the creature, as compared with man, is no guidance for proportioning the dose of a medicine which will affect it.

"Thus, it appears, that, not only is the digestive process of fowls so essentially different to that of man; and hence the effects and changes produced on matters introduced into their stomachs, whether food or medicine, also different; but, what is of the highest moment, other organs and structures of the body in fowls bear little analogy or resemblance in their functions to those of man. Hence, it is wholly irrational to conclude that, when poultry fall into disease, they can be cured by medicines which in man, produce their curative results, chiefly by their influence on associated and, may be, distant organs."

Farmers' Clubs.

TRING.—At the annual meeting of this Society a handsome testimonial of the esteem of that association was presented to their secretary Mr. Brown. In acknowledging it, he took occasion to refer to the advantages of such societies to local and general agriculture. He said: Meetings of this kind become of more and more importance every year; here we learn from each other and we get to know the latest improvement in agricultural mechanics. Many gentlemen present are not aware how much agricultural prosperity has recently been improved by Acts of Parliament—I refer particularly to the acts affecting entailed estates. Three-fourths of the land in this kingdom is under settlement, and an act has been recently passed enabling the proprietors of entails to borrow money on certain conditions, and thereby to effect great improvements in buildings and drainage. The expenses of Enclosure Acts are now paid for by the public, instead of as formerly by the proprietors, and several other acts have been passed all tending to further agricultural improvement; and these are necessarily of great benefit, because if a landlord is unable to do his share of improvement, it is not likely that his tenants will do theirs. In passing through the list of prizes, I see the rewards to labourers and ploughmen. I don't think it possible to effect greater good than by such rewards, because good ploughing is the foundation of good farming; and until you have a system to supersede ploughing (which you probably may have before long) you must encourage good ploughmen. Next, as to labourers who have been long in one service. We know that remarks have been made and circulated in newspapers that farmers have not the interest of their labourers at heart, because they do not offer higher prizes for long servitude; but the amount of the prizes depends on the state of our funds, and the prize is meant as an acknowledgment, and not as a reward. I should not like to see these prizes done away with, for the result this year is to bring before us five men, who have each been 39 years with their employers. The prize for rearing sheep is also necessary, for the calling of a shepherd requires incessant vigilance and care, and the men who receive prizes for the number of lambs named in our award to-day,

deserve our regard and esteem. The prizes offered by Mr. Williams and Mr. Dorren I regard as of the greatest importance, for I believe a good field of Turnips to be a proper criterion of the cultivation of the farm, because that is the principal crop on which we start. In reference to the labourers, I would remark that I was at the agricultural meeting at Lincoln, and paid a visit to a large farmer living near the city. I was speaking to him of the cost of labour, and found that he paid 15*s.* a week for wages. I told him our average, which is considerably lower, and said that gentlemen hereabout could not pay more. I asked him what was the cost of labour per acre, because, after all, that is the real test; and I found that his labour did not average above 20*s.* per acre, on a farm of 700 acres—(Voices, "It can't be done—it must be nearly all Grass.")—and yet he paid 15*s.* a week. How it is done is a problem yet to be solved; but there is one thing, that labour is always better done by the piece than by the day, when you can manage it. I regret there were not more competitors for the cottage garden produce; it is a class of prizes I wish to see extended, and I would just remark it is a pity there is not more attention paid to labourers between 18 and 21 years old, because in those years the man is formed, and we see whether he will go to the right hand or to the left; and I am sure that every member of this society wishes to see the labourers do well.—Thos. Butcher, Esq., in proposing "Prosperity to the Tring Agricultural Society," referred to the statistics of agriculture, and stated that round Aylesbury the annual return for ducks is 40,000*l.* He knew one man alone who had 1000 to 2000 ducks, and who paid 50*l.* at a time for Barley meal.

Miscellaneous.

On the Cost and Current Prices of Wheat in England in 1844—54.—Mr. Danson argued that the farmer himself was the greatest sufferer from the want of some system which would enable him to prevent the fluctuations in the price of corn, and better to adjust the supply to the demand. At present the English farmer was best acquainted with the "literature" of the Government through the tax-paper; and it was natural, therefore, that attempts to obtain agricultural statistics should at the present time meet with his strenuous opposition. One way of meeting this difficulty was to appeal directly to his interests, and to show him—and the Statistical Society, above all others, was called upon to perform this task—how great a sufferer he was for want not only of the Government, but himself, and the whole community, knowing what are the actual fluctuations in the price of corn, and how they were brought about, in order to know how they might be prevented.—Sir John Boileau, as a resident of an agricultural county, felt much interested in obtaining some satisfactory statistical returns. He believed that the mode of collection which, under the auspices of the Government, was practised in Norfolk and Hampshire last year, and which during the present year was to be extended to two other counties, would be one of the greatest boons to agriculturists. *Meeting of the British Association.*

Calendar of Operations.

NOVEMBER.

WEST SUSSEX, *Oct.* 24.—Wheat sowing is now the principal work upon the farm, and will soon be over. The weather suits well, and the land works well; altogether the season could not be more favourable. The most common method here is to use the presser behind the plough, and then sow broadcast, when as a matter of course it comes up pretty regularly in drills, and has the appearance of a drilled crop. But the presser has got into so general use, chiefly for putting the grassy edge of the furrow down, which is done more efficiently by the skim coulters; but they have but lately come into use, and are not yet to be seen but in few places. It would be well if they were more common, as they answer so well, not only in ploughing Clover lea, but also stubbles, as they effectually bury the rubbish below, and yet leave the land open to be operated upon by the frost, which pressing does not. All work is well advanced, and it seems likely that there will be many hands out of work, which will be hard with the labouring classes when everything in the way of living appears to be getting so high. Fat cattle are selling well, and so are sheep, and the latter are likely to become scarce. The Turnips are but an indifferent crop, and will have to be preserved as long as possible. At the end of harvest we thought we were to have cheap Barley, and that pig fatting was to be a grand thing, but the Barley as well as other Corn has got up, and little can be expected in this way. But still meat of all kinds is high, and fatting ought to pay as well as it usually does. Grass, which all the summer was scarce, has lately come up well; but we must not trust much to it at this time of the year, as it does not possess the same power for keeping up the condition of the stock, and we must help them a little in the yards. The young Clovers have got up a little better than they promised when the Barley was cut off, but we fear in many patches they will fail. The Tares, Rye, and Trifolium that we sowed in September, are well up, and we shall depend upon them to make up our deficient Turnip feed. Ewes have been bought in lower by 4*s.* to 6*s.* a head than last year, and have come to market in good order generally; but they lately rose 2*s.* to 3*s.* *G. S.*

Notices to Correspondents.

CONVERSION OF OAK: *A Constant Reader.* [Pray excuse the delay of this.] I would advise "A Constant Reader" to dispose of the Oak trees and buy yellow Balk, as it will not only be cheaper but will last longer than green Oak: the expense of cutting down and converting the Oak will be greater than paying for the Balk and converting it. *J. M.*

TOP DRESSING: *J W K.* says when farm yard dung is applied as a top dressing to Grass lands, a great loss of ammonia is generally sustained. The dung is first put on the land in heaps, and remains so perhaps for some time, and should dry weather prevail now, and after it has been distributed over the surface, a great loss of volatile ammonia must take place. Would not this great waste be in a measure prevented by mixing with the manure heap before applying it, sulphuric acid diluted with water, and so fix the ammonia in the form of sulphate? [No doubt it would; but we should recommend, in preference, its mixture with earthy matter, so as to form a bulky compost.]

BY HER MAJESTY'S ROYAL LETTERS PATENT.

ALFRED KENT'S PATENT WEATHER-PROOF GLAZING WITHOUT PUTTY.—For Horticultural Buildings in Wood or Metal.

HORTICULTURAL BUILDING WORKS, CHICHESTER.

Illustrated Books describing inventions, containing prices and particulars relating to the different designs, sent on receipt of four postage stamps. Nurserymen and others appointed agents on application.

Horticultural Buildings upon this plan having been erected in many different parts of the country, and having stood the trial of all weathers, and more especially the severest of all, viz., frost, A. KENT, with full confidence, strengthened by the many flattering testimonials he has received, can safely guarantee the proper working of his Patent System of Glazing. Estimates and Plans sent, including Heating by Hot Water.

☞ WANTED, a FOREMAN, well acquainted with all the details of Horticultural Building, capable of making a plain line elevation and giving general instruction. Must be a good bench hand.—Address as above, giving references, wages required, age, &c.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, 296, Oxford Street, London.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt.

HARTLEY'S PATENT ROUGH PLATE, for Roofing Conservatories, Halls, and Public Buildings.

PLATE, CROWN, and SHEET WINDOW GLASS.

Coloured and Ornamental Glass of every description.

Glass Milk Pans, Pails, Tests, and Measures; Cream Pots and Syphons; Churns, Butter Tests and Slabs; Tiles and Slates; Bee Hives, &c.

Moore's Patent Ventilator and Lockhead's Patent Perforated Glass, for Dairies and Greenhouses.

Aquaviviariums, Fern Shades, Propagating Glasses, Fruit Protectors, Preserve Jars, Cucumber Tubes, Hand Lights, Flower Vases, Labels, &c., and all kinds of Agricultural, Horticultural, Architectural, Domestic, Scientific, and Ornamental Glass, British and Foreign, at the lowest prices.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

Packed in Boxes of 50 feet each.

6 by 4 and 6½ by 4½	...	...	...	10*s.* 6*d.*	per box.
7 " 5 " 7½ " 5½	...	...	...	12 0	"
8 " 6 " 8½ " 6½	...	...	...	13 6	"
9 " 7 " 9½ " 7½ and 10 by 8			...	15 0	"

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2*s.* each extra, full price allowed if returned free of expense.—For further information apply to

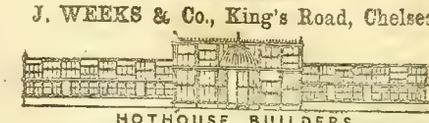
JAMES PHILLIPS & Co.,
116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.
J. WEEKS & Co., King's Road, Chelsea, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

HETLEY AND CO. are supplying 16-oz. Sheet Glass of British Manufacture, packed in boxes, containing 100 square feet each, at the following REDUCED PRICES for cash. A reduction made on 1000 feet.

Sizes.—Inches.	Inches.	Per foot.	Per 100 feet.
	Under 6 by 4 at	1½*d.* is	£0 12 6
From 6 by 4	" 7 " 5 "	2*d.* "	0 16 8
7 " 5	" 8 " 6 "	2½*d.* "	0 18 9
8 " 6	" 10 " 8 "	2½*d.* "	1 0 10
10 " 8	" 12 " 9 "	2⅔*d.* "	1 2 11

Larger sizes, not exceeding 40 inches long.
16 oz. from 3*d.* to 3½*d.* per square foot, according to size.
21 oz. " 3½*d.* to 5*d.* " " "
26 oz. " 3¾*d.* to 7½*d.* " " "

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in sheet or Rough Plate Glass.

Propagating Glasses, Beehive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in Glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY & Co., 35, Soho Square, London.

GLASS FOR HORTICULTURAL PURPOSES.

THOMAS MILLINGTON'S

Present Prices for good 16 oz. SHEET GLASS per 100 feet, boxes included:—

6 ins. by 4 ins.	Per 100 feet.	8½ " 6½	Per 100 feet.	12½ ins. by 9½ ins.	Per 100 feet.	15 " 10	Per 100 feet.

8 " 6		12 " 9		14½ " 10½		13½ " 11½	

And many other sizes not exceeding 1 *foot* 6 *inches superficial.*

Orchard House Squares on Mr. Rivers's plan, to whom I have sold some thousands of feet, in 20 inches by 12, 20 by 13, 20 by 14, 20 by 15, 20 by 16, 20 by 18, at 1*l.* per 100 feet.

Large sizes cut, not exceeding 40 inches long, 16 oz. from 3*d.* to 3½*d.*; 21 oz., from 3½*d.* to 5*d.*; 26 oz., from 4½*d.* to 7½*d.*; 26 oz., from 5*d.* to 9*d.*, according to size.

Large Sheets in 200 feet cases, from 40*s.* to 46*s.* per case.

Genuine White Lead, Black, Green, Yellow Red, and Anti-corrosion Paint; Oils, Varnishes, Brushes, and any article in this branch.

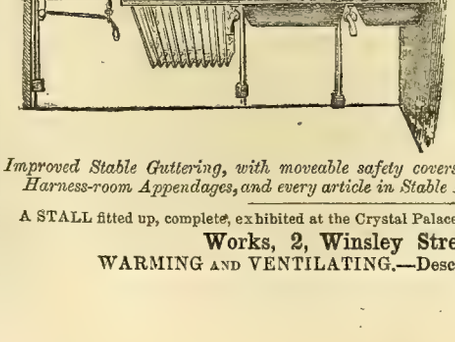
HARTLEY'S IMPROVED ROUGH PLATE GLASS, Sheet and Rough Plate Tiles, Milk-pans, Bee and Propagating Glasses, Wasp Traps, Cucumber Tubes, Preserve Jars, with and without covers, and Fern Shades. Plate, Sheet, Crown, and Ornamental Window Glass; Crystal Glass Shades for Ornaments.

Greenhouses erected in either Wood or Iron, Garden Lights and Frames.

A full List furnished on application at the Warehouse.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.
87, Bishopsgate Street Without, London (same side as Eastern Counties Railway.)

COTTAM'S NEW PATENT FOR STABLE REQUISITES.



COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest. The

ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANIZED, or ENAMELLED.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at their

Works, 2, Winsley Street, Oxford Street, London.
WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, Engineer, Battersea.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S Horticultural Works, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

NETTING FOR SHEEPFOLDS, made of Cocoa-nut Fibre; a material known to possess the most extraordinary durability when exposed to the alternations of weather. It will wear out several sets of tarred hemp netting, and is so light that a herdsman may with ease carry 200 yards of it. Sold in Nets of 50 and 100 yards long, 48 inches high, by the Manufacturer, W. Cullingford, 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

BIRD NETS, BAT-FOLDING NETS, for Bird Catching, 5*s.* each; with Bamboo Poles complete, 10*s.*; extra large, 15*s.* complete. Clap Nets for Bird Catching, 12 yards long, 5 feet deep, 15*s.*; with staffs, pull-line, and stop-cord, 1*l.* Lark Nets, made square mesh, any size required, 3*d.* per square yard. A Partridge Trammel, 30 yards long, 5 yards wide, made square mesh, 1*l.* 11*s.*; or any less size, 2*d.* per square yard.
W. Cullingford, 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

POULTRY, RABBIT, SHEEP, AND CAT FENCING. Hare or Rabbit Nets, on Cords, for Covert Shooting, 12 mesh over, 4 feet wide, 1½*d.* per yard.; 18 mesh over, 6 feet wide, 2½*d.* per yard; 24 mesh over, 8 feet, 3*d.* per yard; each Edge Corded, ½*d.* per yard extra; extra Stout ditto, 18 mesh wide, 4*d.* per yard, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing against fowls, cats, &c., at W. Cullingford's, No. 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

CHEAP WIRE GAME AND POULTRY NETTING.

	Plain.	Galvanised.
24 inches wide, 2-inch mesh,	3*d.* to 4*d.* per yard.	6*d.* per yard.
36 inches wide, 2-inch mesh,	6*d.* per yard.	9*d.* „
48 inches wide, 2-inch mesh,	9*d.* „	1*s.* 0*d.* „

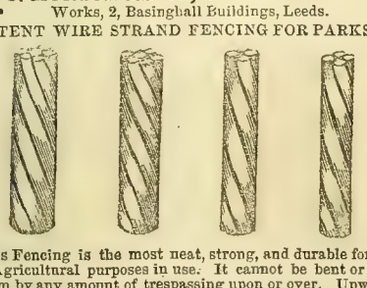
Sparrow Proof Netting, galvanised, 3*d.* per square foot, made to any size. This artic'e is shown at the Sydenham Exhibition, where it is much admired.
W. Cullingford, 1, Edmund Terrace, Ball's Pond Road, near the Gate, Kingsland, London.

CHEAP WIRE GAME & POULTRY NETTING
5*d.* per running yard.
GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

	Galvanised.	Not Galvanised
24 in. wide, 2 in. mesh,	7*d.* per yard.	5*d.* per yard
30 in. „ 2 in. „	9*d.* „	6½*d.* „
36 in. „ 2 in. „	10½*d.* „	7½*d.* „
48 in. „ 2 in. „	1*s.* 2*d.* „	10*d.* „

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. Fox, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

H. J. MORTON and Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, Hydraulic Engineer, 70, Strand, and Bridgefield, Wandsworth.

HOSE PIPING.—Great Reduction in Price.
PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.
BURGESS and KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

REDUCTION IN PRICE.
WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.
Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.
Edward Weir, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.
Catalogues, with Illustrations, sent free by post.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel,	Length of Barrel, under nose.		£	*s.*	*d.*
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER and SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

DEANE, DRAY, and CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge.
Established A.D. 1700.

TWO FARMS,
A Few Miles from the City of Chester.
TO BE LET, by Tender, an excellent DAIRY FARM, containing 150 a. 2 r. 14 p., called Rushall Hall, situate in the parish of Tattenhall, in the county of Chester, two miles from Tattenhall Station on the Chester and Crewe Railway, in the occupation of Mr. George Robinson. A great portion of the Farm has been thoroughly drained, and a portion of the Grass Land boned; and it is contemplated to complete the draining and boning of the Farm the ensuing winter. The House is commodious and will be put into thorough repair. The present Farm Buildings will be taken down, and an entire new set of buildings suitable to the Farm erected. Possession of the House on the 12th of May, and of the Lands on the 2d of February next.
Also an excellent DAIRY FARM, containing 156 a. 2 r. 23 p. At present a part of the above Farm is in the occupation of Mr. George Robinson, on which has this year been erected a commodious House, suitable for a highly-respectable family, and the Buildings and Premises arranged with every attention to comfort and convenience. A great portion of the Land has been drained and boned, and the whole that is required will be completed the ensuing winter. Immediate possession may be had of the House, Buildings, and Garden; and of the Land on the 2d of February next.
John Ennion, of Hatton Heath, near to the Turnpike-gate where the road branches to Tattenhall, will show the Farms; and particulars had of Mr. John Palin, Christleton, near Chester, or at the Office of John Palin & Son, Westminster Buildings, Newgate Street, Chester, where a Map of the Property may be seen, and offers in writing sent.

MONMOUTHSHIRE.
TO BE LET, for a term of years, and entered upon at Lady-day next, the FARM of LLANVAIR GRANGE. It consists of 164 acres of rich productive Land, of which 4 acres are in Orchard, 76 in Meadow and Pasture, and 84 are Arable. There is a comfortable Farm-house and Garden, Dairy and Cheeseroom, and ample Farm Buildings on the Farm. It is within a short distance of the Pontypool Iron Works; there is a station on the Newport and Hereford Railway close by. At the Iron Works there is a constant demand for every kind of Farm produce. The proprietor at Llanvair Grange will direct some one to show the Farm; and for particulars apply to Mr. John Morton, Morningside, Nailsworth, Gloucestershire.

VALUABLE FREEHOLD NURSERY GROUNDS, ETC.,
Fulford Road, York.
TO BE SOLD, by private contract, the long-established and flourishing NURSERY PREMISES of the late Mr. George Clarkson, situate on the banks of the Ouse, York, comprising about 14 acres of first-rate Nursery Ground, well stocked with Forest and Fruit Trees, Shrubs, &c., and having a substantial DWELLING-HOUSE, SHOPS, and GREENHOUSE, and other requisite Out-buildings attached. The purchaser will have the option of taking the whole or part thereof, and the Stock on liberal terms. Immediate possession can be given, and plans and particulars may be had on application to Mr. Luke Thompson, Solicitor, York.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill.
Illustrated Catalogues forwarded post free.

TO BE DISPOSED OF, a few first-rate GREY DORKING CHICKENS, very large, and bred from first prize birds. Price from 10*s.* to 1 guinea each, according to age, weight, &c.—Apply, inclosing stamped envelope, to R. Atkinson, Singleton Park, Kendal.

TO POULTRY FANCIERS.
TO BE DISPOSED OF, above 150 head of the purest and best specimens of the following descriptions of Poultry, for 100*l.*:—Brahma Pootras, Silver Cinnamon, Buff, Cinnamon, Lemon, Grouse, Black and White Cochins, Japan Silk Fowls, Guinea Fowls, Dorkings and Aylesbury Ducks, Cambridge, Norfolk, White, and Lemon Turkeys. Most of these have been selected from the yards of first-rate amateurs, and are of great value.—Apply immediately to L. M., Post Office, Cromer, Norfolk.

TO
CAPITALISTS DESIRING A LUCRATIVE OCCUPATION.
TO BE DISPOSED OF immediately, the Patent right of a novel, useful, and portable Invention for increasing Food and Employment or Amusement for rich or poor in the United Kingdom. Also, a simple and efficient apparatus for the Preservation of Life in Town or Country, not yet patented. Full particulars, with reference, will be given on immediate application to A. Z. A., Post-office, Cromer, Norfolk.

Catalogues may be had on the premises; of Mr. Langland, Builder, High Street, Epsom; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.
MESSRS. PROTHEROE and MORRIS are directed by the proprietor (in consequence of the ground being let for building) to Sell by Auction, without reserve, on the premises, London Fields, Hackney, on MONDAY, November 13, at 11 o'clock, the entire NURSERY STOCK, consisting of Elms, Chestnuts, Limes, and Poplars; also about 600 Variegated and Green Hollies, Irish Ivy, Aucubas, Box, fine Moss and other Roses, &c. On view prior to the sale; Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.
MESSRS. PROTHEROE and MORRIS will sell by Auction, at the Mart, Bartho'omew Lane, on TUESDAY, November 14, and THURSDAY, the 16th, at 12 o'clock, a first-class Collection of DUTCH BULBS, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Anemones, Crocus, Snowdrops, Tulips, &c.; also a selected assortment of Standard and Dwarf ROSES, Ornamental Trees, and American Plants, well set with bloom, buds, &c. On view the mornings of sale.—Catalogues to be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM, SURREY.—FINAL SALE.
To Noblemen, Gentlemen, Exhibitors, Nurserymen, Builders, and Others.
MESSRS. PROTHEROE and MORRIS are instructed by the administrators of the late Mr. Joseph Fairbairn to sell by Auction, without reserve, on the premises, the Clapham Nursery, Clapham, near London, on MONDAY, November 20, 1854, and following days, at 11 o'clock each day, the whole of the valuable and extensive stock of CHOICE GREENHOUSE and STOVE PLANTS, which is particularly worthy the attention of Noblemen and Gentlemen enriching their collections, as well as the Trade, from its excellence; comprising 50,000 choice Ericas; 10,000 Epacris; 4000 Indian Azaleas; 2000 Aphelexes; 1000 Double Camellias; 5000 Camellia Stocks; two Allamanda purpurea; New Double White and Purple Primula fimbriata, Cyclamen persicum, Daphne indica, rubra, and every variety of Stove and Greenhouse Plants in cultivation; magnificent young specimen Heaths, &c. Also the entire stock of fine Evergreens, Ornamental Trees, and Deciduous Shrubs, including large Green and Variegated Hollies, Box, Yews, Aucuba, Laurels, fine Araucaria imbricata, Cryptomaria japonica, Cedar Lebanon, Cedrus Deodara, &c.; together with several 3 and 4 Light Boxes; Pits; 300 Bell Glasses; 3 Capital Tumbril Carts; 1 Spring Cart; 2 Useful Horses; 2 sets Harness; Iron Rollers; Gardeu Tools; Wheelbarrows, and sundry effects.—May be viewed one week prior to the Sale. Catalogues may be obtained (6*d.* each, returnable to purchasers) on the premises; at the Seed Shop, High Street, Clapham; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NURSERYMEN, SEEDSMEN, FORESTERS, ETC.
Roup of Nurseryman's and Seedsman's Stock.
TO BE SOLD, by Public Roup, in Lots, on THURSDAY, November 16, the whole of the large and well-assorted STOCK of FOREST, FRUIT, and ORNAMENTAL TREES, EVERGREEN and DECIDUOUS SHRUBS, &c., in the Nursery, at Bankfoot, Cupar Fife, belonging to the Sequestrated Estate of Hamilton Laird, including about 150,000 1 and 2 years' Transplanted Larch, 300,000 do. do. Scotch Fir, 400,000 do. do. Spruce, 14,000 do. do. Silver Firs, 60,000 do. do. Beech, 50,000 do. do. Oaks, 45,000 do. do. Thorns, and large quantities of Elm, Plane, Ash, Poplar, Lime, Mountain Ash, Chestnut, Portugal Laurel, Bay, Irish Juniper, Irish and Common Yew, Holly, Cherry, Pear and Apple Stocks, Peach, Gooseberry, Currant, Dwarf and Standard Roses (named), &c. The above are all healthy and well-rooted plants, and well worthy the attention of parties who intend planting this season. Also a quantity of Greenhouse Plants, and the Greenhouse, with building connected therewith; and a Brood Sow, with 12 Pigs, 7 weeks old; and immediately after the above, there will be sold in the Loft, near the Railway Station, Cupar, a quantity of Seed, consisting of 30 bolls Rye-grass; 6 cwt. Cabbage, Linseed, Onion, Carrot, Peas, Beans, and other Garden, Flower, and Agricultural Seeds; two pairs Seed Fanners; Wire Riddles, Sieves, Sacks of various sizes, and a large quantity of Flower-pots. The sale to commence at 10 o'clock A.M. precisely.—The above may be seen at any time before the sale, on application to Mr. Andrew Taylor, Banker; or W. A. Taylor, Writer, Cupar.—Cupar Fife, November 4.

THE NATIONAL GARDEN ALMANAC AND HORTICULTURAL TRADE DIRECTORY FOR 1855.
By JOHN EDWARDS, F.H.S. The Third Annual Issue.

No effort will be spared to retain the flattering encomiums universally bestowed on the previous issues of this work, which, for general accuracy, and sound practical utility, is acknowledged to be immeasurably in advance of all similar publications.

Advertisements, Communications, Books for Review, Information relative to Changes of Addresses, &c. &c., gladly received, if not later than the 20th November, by

JOHN EDWARDS, Wace Cottage, Holloway, Middlesex.

The TWENTY-THIRD PUBLIC DRAWING will take place on Saturday, the 11th inst., at Noon, at the Offices, 33, Norfolk Street, Strand, London.

LONDON NECROPOLIS COMPANY.—It is intended to OPEN the CEMETERY on the 13th November, and this Company will undertake Funerals on and after that date.

A train, conveying Funerals and mourners only, will start from the Westminster Road Station daily at 11·20 A.M.

Forty-eight hours' notice of any intended Funeral must be given at the office of the Company, 2, Lancaster Place, Waterloo Bridge, where full particulars of the general arrangements may be obtained. The Charges are:—

First-class Single Grave in perpetuity, including conveyance of Coffin to Woking, Funeral Service, and Interment	£ 2 10 0
Second-class, ditto ditto	1 0 0

This Company has also contracted with eminent and responsible Undertakers and Statuaries, so that the public may either employ their own Undertaker or Statuary, or, by one payment, obtain all the requirements of a Funeral.

A detailed Tariff may be obtained on application, either in person or by letter. By order,

RICHARD CHURCHILL, Secretary.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

TEN THOUSAND STOVES.

THE TENTH THOUSAND OF THE PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, AND CO., 46, King William Street, London Bridge; and may be obtained of most Ironmongers.

The IMPROVED PATENT VENTILATING STOVE, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded post free.

EVERYTHING FOR THE TOILET AT MECHI'S MANUFACTORY, 4, Leadenhall Street.—Superior Hair, Nail, Tooth, Shaving, and Flesh Brushes, Clothes and Hat Brushes, Combs, Washing and Shaving Soaps, various Nail and Corn Instruments, Razors, Razor Strops and Paste, and Shaving Powder; ladies' and gentlemen's Dressing Cases, with or without fittings, in Russia leather; Mahogany, Rosewood, and Japan Ware; ladies' Companions and Pocket Books elegantly fitted; also Knitting Boxes, Envelope Cases, Card Cases, Note and Cake Baskets, beautiful Inkstands, and an infinity of *recherché* articles not to be equalled.

NOW IN SEASON.

REAL YARMOUTH BLOATERS: A Treat to Epicures.—One hundred Choice Bloaters in a case for 6*s.*, forwarded to any "Address." Carriage paid as far as possible: Extra quantity allowed where carriage cannot be paid through. Remittances are requested with orders.

Apply to HENRY H. BAKER, Fish Merchant, Great Yarmouth.

TO LOVERS OF FISH.—100 Genuine Yarmouth Bloaters for 6*s.*, package included, forwarded to all parts on receipt of Penny Postage Stamps, or Post Office Order for the amount preferred.

Address, THOMAS LETTIS, Jun., Fish Curer, Great Yarmouth.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, Nov. 4, 1854.

WILLIAMS' EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON have been appointed Agents by Mr. Davis, of Malvern, for the sale of the above-named magnificent CLIMBING ROSE. Good established plants, 3*s.* 6*d.* each. Usual discount to the trade. For particulars purchasers are referred to their own and Mr. Davis' advertisements in *Gardeners' Chronicle* of October 7, page 643.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application.—R. KENNEDY, Bedford Conservatory, Covent Garden, London.
P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

GLENNY'S SUPERB BALSAM SEED, the finest in the world; saved from flowers 3 inches across. Six classes in sealed packets, with directions for culture, 37 stamps; mixed packet, 13 stamps.—Address G. GLENNY, Dungannon House, Fulham.

GEORGE JACKMAN begs to announce that he has just published a new and complete CATALOGUE of his Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.
Woking Nursery, 1½ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—November 11.

HYACINTHS AND DUTCH BULBS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that he has received his HYACINTHS AND DUTCH BULBS, in excellent condition, and that they are much finer than usual. He begs to say he has a few bulbs of Calochortus luteus, and Lilium Thompsonianum still for sale.—His CATALOGUE of BULBS, &c., will be forwarded on application.

LILIUM LANCIFOLIUM.

HENRY GROOM, Clapham Rise, near London, by appointment, FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that this is the best time to have Bulbs of the different varieties of this most BEAUTIFUL LILY. They are well adapted for the Flower Garden, American Borders, and Drives in Parks, being quite hardy. His Catalogue may be had on application.

NEW CHRYSANTHEMUMS.

JOHN SALTER'S collection, containing all the established favourites, and upwards of 60 new varieties of this season is now in bloom, and may be seen every day except Sunday.—Versailles Nursery, William Street, near Hammersmith Turnpike.

FINE SPECIMEN PLANTS.

J. AND J. FRASER beg to invite attention to their magnificent Collection of large AZALEAS, HEATHS, and other Plants, which were never in such good condition as at the present time. This is an excellent opportunity for buyers as (on account of not having sufficient room) the plants will be offered at very low prices.
The Nursery, Lea Bridge Road, Essex.—Nov. 11.

STRAWBERRY PLANTS.

CUTHILL'S BLACK PRINCE ... 21*s.* per 1000.
" PRINCE OF WALES ... 40*s.* "
BRITISH QUEEN ... ... 21*s.* "
ELTON PINE ... ... 21*s.* "
PINCE'S NIMROD, New ... ... 20*s.* per 100.
J. G. WAITE, Seed Merchant, 181, High Holborn, London.

OMER PACHA STRAWBERRY.

WILLIAM JAMES WARD has still to spare a few more well-rooted plants of the above excellent Strawberry. Testimonials of the highest order. See advertisement in the *Gardeners' Chronicle*, August 26; also in the Descriptive List of New Fruits in the "Florist and Fruitist," Sept. Number, accompanied with a woodcut.

100 Plants	£3 0 0	25 Plants	£1 0 0

FOREST TREES, ETC.

PETER LAWSON & SON, Edinburgh, the QUEEN'S SEEDSMEN, &c., respectfully acquaint their patrons in England and the public, that their PRICED LIST of PLANTS for the season is now ready, and may be had on application, at their Branch Establishment in London.
All orders sent to the London Branch will be immediately executed, and delivered in London free of expense.
27, Great George Street, Westminster, November 11.

JAMES MELDRUM, NURSERYMAN, Kendal, Westmoreland, begs to offer, upon the most reasonable terms, upwards of one million of fine stout two-year SEEDLING OAKS, and also two-year SEEDLING ASH.—Price on application.

FORRES NURSERIES.

JOHN GRIGOR AND CO., Nurseries, Forres, have for sale a large stock of true native SCOTCH HIGHLAND PINE PLANTS, LARCH, DEODARA, and FOREST TREES in general. The numerous premiums awarded by the Highland and Agricultural Society of Scotland for raising true native Highland Pine Plants, have all been awarded to J. G. & Co.
Priced Lists forwarded on application, and the trade supplied at the wholesale rate.

THREE NEW ROSES.

DUCHER, Rose Florist, Rue du Vivier (Guillotière, Lyons, (France).

THÉ LOUISE DE SAVOIE.—Growth vigorous, foliage dark green, buds large and very long, flower very large and full, colour sulphur to light yellow, blossoms very freely; resembles Chromatela, but superior. Strong plants, 15f.

CICERO, HYBRID PERPETUAL.—Growth very vigorous, foliage light green, buds large and long, flowers very large and almost flat, in two distinct colours, the centre variegated, and the edges of the petals dark crimson; blossoms very freely; curious perfume. This is a very remarkable Rose. Strong plants, 12f.

DEUIL DE F. WILLERMOS.—Growth moderate, flower medium full, colour dark purple shaded to black, the darkest of this class; blossoms very freely. Strong plants, 15f.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for Geraniums (show and fancy), French Geraniums, Fuchsias, Verbenas, Fairy Roses, Chrysanthemums, Heliotropes, Cinerarias, Calceolarias, Primulas, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

The stock of show Geraniums exceeds 50,000, and comprises upwards of 750 varieties, amongst which almost every known kind will be found. The newest sorts, such as Carlos, Virginia, Rosa (Foster's), Leah, Picta, Marginata, Empress, Neatness, &c., can be had at 3s. 6d. each, or 40s. per dozen. The older varieties from 9s. to 25s. per dozen.

The selection of FRENCH GERANIUMS consists of 40 distinct sorts (exclusive of those English Geraniums which some class with them), at 2s. 6d. each, or 25s. per dozen.

SEEDLING CINERARIAS (10,000), from seed of first-rate flowers, at 4s. per dozen, in 60-sized pots.

20,000 SEEDLING HERBACEOUS CALCEOLARIAS now on hand at 4s. per dozen in 60-sized pots. These flowers have been raised from the seed of the best of last year's stock, which received general praise.

An immense quantity of good fimbriated PRIMULAS at 4s. per dozen in 60-sized pots, and 6s. per dozen in 48's.

CHRYSANTHEMUMS (Lilliputian and large flowering) at 6s. and 9s. per dozen for plants which will flower this season. Large magnificent plants at 18s. and 15s. per dozen—all the best sorts.

The foregoing have been selected as examples only, it being impossible within the limits of an advertisement to afford particulars of a stock so extensive; Catalogues will, however, be forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, Proprietor.

THE PERPETUAL TREE VIOLET, or DOUBLE VIOLA ARBOREA.—The original grower of this, the true variety of the above beautiful Violet, now offers it to the public; it has surpassed all others, and now stands without an equal for its size of flowers, fragrance, and perpetual blooming; and as a plant for the Conservatory or Greenhouse, nothing can equal it. Large plants, 6s. per dozen; smaller ditto, 3s.

DOUBLE WHITE TREE VIOLET.—This is also a fine variety, and resembles the other in many respects, with the exception of its colour. The stock of this is small, in consequence of the great demand for it last season; parties requiring plants should not delay their orders. 6s. per dozen.

THE RUSSIAN SUPERB VIOLET.—One of the finest of single Violets, large blooms, with long stems, and most delightful fragrance; will bloom well through the season if sheltered from the heavy rains and severe frosts during the dead of winter. Plants 3s. per dozen.

A TREATISE on the best and most effectual mode of cultivating the VIOLET, post free for 12 stamps, or sent gratis with all orders above 5s.

GIANT SCARLET BROMPTON STOCK plants are now ready for planting out; the spikes of flower are very large, (measuring from 18 to 24 inches in length) and so fragrant that they are admired by all who have seen them. Fine strong plants, 6d. per dozen, or 4s. per 100.

STRAWBERRY PLANTS.—Good strong plants of the following superb varieties can be supplied:—Nimrod, 10s. per 100; Prince of Wales, 10s. do.; Ajax, 5s. do.; Ruby, 5s.; Myatt's Eleanor, 3s. do.; British Queen (true), 3s. do.; Black Prince, 3s. do.; Cremont's Perpetual, 3s. do.; Victoria, 5s. do.; Surprize, 3s. do.; and a great number of other good old varieties, at 3s. per 100.

POLYANTHUS SEED, saved from the best laced varieties, 1s. per packet.

ANTIRRHINUM SEED, all saved from the best named varieties, 1s. per packet.

EXTRA FINE SWEET WILLIAM SEED, saved from all the best and most beautiful varieties, 1s. per packet.

VERY SUPERIOR WELL RIPENED HOLLYHOCK SEED, 1s. per packet.

LORD KEYNON'S FAVOURITE CUCUMBER is the best and most productive for winter cultivation ever grown, requiring less heat than any other of the kind. It is a very handsome fruit and free setter. Good old seed of the above true variety may be had, price 2s. 6d. per packet.

The Violets and Seeds will be sent postage free, but the Strawberry Plants and Stocks will be sent by hamper, package free.

Any of the above will be forwarded on receipt of Post Office Order, or Penny Postage Stamps, for the amount by

EDWARD TILEY, Nurseryman, Seedsman, & Florist,
14, Abbey Churchyard, Bath, Somersetshire.

TO THE AGRICULTURISTS OF ENGLAND.

HARRADINE'S "NE PLUS ULTRA" WHEAT.—A single ear of this wonderful Wheat, which was purchased five years ago of a soldier on tramp, who brought it from some distant country, was sown in 1849; the produce of this was again sown in 1850, and also in 1851, when it yielded at the rate of 19 coombs, 1 bushel, and 1 peck per acre. This induced me to continue its cultivation. A sheaf and a quantity of corn will be shown on Messrs. Garratts' Stand in the Agricultural Department of the Crystal Palace, by which its quality and general character may be seen.

The following Gentlemen kindly lent me portions of their land last season, to test the producing quality of the Wheat, and up to this year not one kernel has been sold for seed. The quantity sown on all the varieties of soil has in no instance exceeded 4 pecks per acre. On land of Mr. Wasdale, in the parish of Woodhurst, this Wheat was sown after Tartarian Oats, Clover, Seeds, Peas, and Tares (some being sown in February, and equally productive). On land in the occupation of Mr. Gadsby, in the parish of Godmanchester, 1 acre, the yield of which has been 30 per cent. over his own Wheat, grown in the same field, and has been tested by several Agriculturists in the neighbourhood. On land in my own possession, in Needingworth and other places (both Fen and Highland), it has been sown after Wheat, Clover, Barley, Beans, Oats, and Fallow, and in every instance has been most productive.

I am prepared to part with a limited quantity, which can be had on application to me, at 25s. a bushel. All orders to be accompanied by a remittance.

John Thang Harradine, Needingworth, St. Ives, Huntingdonshire.

RARE CONIFERÆ.

ALEX. PONTEY, Nurseryman, Plymouth Nursery, Plymouth, begs to inform Gentlemen wishing to add to their Arboretums, that he can supply the following. Most of the kinds are planted in his Arboretum. He can warrant them hardy.

Alex. Pontey particularly calls attention to the THUJIOPSIS BOREALIS, which has proved quite hardy, and one of the grandest Coniferæ in cultivation. My specimen plants are now 3 feet high, and show their true character. Lists and prices will be forwarded on application.

N.B.—A. P. can offer an extra-sized Libocedrus Chilensis about 6 feet high—splendid specimen.

Plymouth Nursery, November 11.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to recommend to the attention of Gentlemen and others engaged in Planting, the following plants from his general Stock, they are in fine healthy condition. The American Plants annually exhibited at the Royal Botanic Gardens, Regent's Park, are supplied from this establishment.

RHODODENDRONS.—The following is a selection of the most admired scarlet, rose, and high-coloured varieties in cultivation; are perfectly hardy, and bloom for the most part during the month of June.

Blandyanum, fine rosy crimson	5s. to 7s. 6d. each.
Lady Eleanor Cathcart, vermilion rose and dark crimson spots	21s. 0d. "
Lady Wenlock, bright crimson	21s. 0d. "
Atrosanguineum, dark scarlet...	10s. 6d. "
Alaric, dark purplish crimson	7s. 6d. "
Omer Pasha, dark crimson, new	10s. 6d. "
Juba, crimson, intensely marked	10s. 6d. "
Lefevreanum, crimson, tinged with purple	10s. 6d. "
Attila, dark crimson	7s. 6d. "
The Grand Arab, fine glowing crimson	7s. 6d. "
Brayanum, crimson	10s. 6d. "
Nobleanum bicolor, crimson, white eye	7s. 6d. "
Vandyke, light crimson...	10s. 6d. "
Blatteum, dark purplish red	7s. 6d. "
Rubens, light rose	10s. 6d. "
The Duke of Norfolk, clear rose, fine	10s. 6d. "
Celebrandum, dark crimson purple	10s. 6d. "
Rembrandt, fine crimson	10s. 6d. "
Congestum roseum, fine rose, well marked	21s. 0d. "
Roseum novum, clear rose	10s. 6d. "
Leopardi, rosy purple, and very much marked ...	5s. 0d. "
Floribundum coccineum, fine	10s. 6d. "
Erectum, good crimson	7s. 6d. "
Towardianum, large rose, fine...	10s. 6d. "

For planting extensively, no kinds of Rhododendrons are better calculated for a display than the varieties of the noble Catawbiense; they are all perfectly hardy, producing fine trusses of blooms of various hues—scarlet, rose, purple, white, and spotted white. The list below contains the leading kinds:—

Catawbiense, good bushy plants, 50s. to 63s. per 100.
" larger, 1½ to 2 feet, 12s. to 18s. per doz.
" seedlings, fine bushy plants, 12s., 18s. to 24s. per doz

Catawbiense bicolor	Gloriosum
" splendens	Sherwoodianum
Album elegans	Bouquet de Flore
" grandiflorum	Melanthanma
Cæleste	Pictum
Cyaneum	Roseum elegans
Candidum	Victoria
Delicatissimum	Maculatum nigrum
Egregium	" purpureum
Everestianum	" Macranthum
Finibriatum	Nivaticum
Mirandum	Perspicuum
Lindsayanum	

Good strong well established bushy plants, 30s. to 42s. per doz. Larger plants can be supplied at a corresponding advance of price.

STANDARD RHODODENDRONS.—Of these, without doubt, we possess the largest stock of really good kinds. Nothing can be more imposing when in bloom than a handsome standard. We have them 3 feet to 5 feet stems, and handsome symmetrical heads. The price of such would range from 42s. to 105s. each.

Rhododendron ponticum, good plants, 10s. 6d. per 100; larger, 1 to 1½ to 2 feet, 12s. 6d., 15s. to 25s. per 100. This is especially worthy the attention of planters; it will thrive in any soil, and in the most severe weather; is never injured by hares or rabbits. Unquestionably it is by far the best shrub for under cover.

KALMIA LATIFOLIA, good bushy plants, 60s. per 100; larger, 12s., 18s. to 24s. per dozen.

HARDY HEATHS, in 20 fine, named, varieties, many of them well suited to form edgings for larger clumps, 35s. to 42s. per 100.

HARDY AZALEAS.—A good assortment, if left to our selection, suitable for extensive planting, 1 to 1½ and 2 feet, 3l. 3s. per 100. The very best selected Ghent and other varieties, 18s. to 30s. per dozen. These produce flowers of all colours—scarlet, rich orange yellow, rose, and white.

STANDARD ROSES, of the most approved Perpetual and Bourbon varieties, 3 to 4½ feet stems, 18s. per dozen.

PINUS Douglasi, handsome seedling plants, 3 to 4 and 6 feet.
" insignis; we strongly recommend our stock of this justly admired Fir, all of which are from seed, 2 to 3, 4, & 5 ft.
" cembra, 3 to 4 and 5 feet.—Pinus excelsa, 3 to 6 feet.
" macrocarpa, 2 to 3 feet.
" Lambertiana, very handsome, 3 to 4 feet.
Araucaria imbricata, splendid formed specimens, 2 to 4 feet.
Cedrus deodara, of all heights, from 1 to 8 feet. We have a large quantity about 4 to 6 feet.
" Africana, 3 to 4 feet.
" Lebanon, handsome grown specimens, 3 to 6 feet.
Cryptomeria japonica, 3 to 12 ft.—Libocedrus chiliensis, 2 to 3 ft.
Fitzroya Patagonica, 2 feet.
Cupressus Goveniana, 3 to 4 feet.
" Lambertiana, 3 to 4 and 5 to 6 feet.
Irish Junipers, 4 to 5 feet.—Irish Yews, 4 to 8 feet.

The above-named Coniferous Plants have been frequently transplanted, are perfect specimens, and have never been grown in pots. Prices will be forwarded on application.

J. W. begs respectfully to solicit an inspection of his stock, from those who are engaged in planting. A Catalogue, containing full descriptions of his celebrated Collection of Rhododendrons, as exhibited by him at the Royal Botanic Gardens, Regent's Park, can be obtained by inclosing two Postage Stamps.

TO GENTLEMEN ENGAGED IN PLANTING.

JAMES GRAHAM, successor to Messrs. Silverlock and Son, respectfully invites attention to his stock of hardy Ornamental Trees and Shrubs, fine large transplanted Forest Trees, Trained Peaches, and Nectarines on walls, Apricots, Plums, Apples, Pears, Cherries, &c.; Figs, Gooseberries, Currants, Strawberries, &c.; Grape Vines from eyes, Archangel Mats, Mushroom Spawn, Dutch Bulbs and Seeds, improved Sion-house Cucumber Seed, 2s. per packet. N.B. Gardens and Pleasure Grounds laid out and planted.—Northgate Nursery, Chichester.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Their new descriptive Fruit Catalogues, Ornamental Trees and Shrubs, American Plants, choice Rhododendrons, Roses, &c., can be had on application.

Pine-apple Place, Edgeware Road, London.

GARDEN NETS, FISHING NETS, SHEEP NETS, AND RABBIT NETS (made by hand, as machine-made knots slip), supplied at very low terms. Samples sent free.

W. Cullingford, 1, Edmund Terrace, Ball's Pond Road, Kingsland, near the Gate, London.

Six Tents to sell cheap.

HOSE PIPING.—Great Reduction in Price.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, Mason and Builder, Pimlico Marble and Stone Works, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

TO FLORISTS AND OTHERS.

J. JONES, Iron Merchant, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. Jones, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, Engineer, Battersea.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S Horticultural Works, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. Weeks & Co., King's Road, Chelsea, London.

SPLENDID CONSERVATORY PLANT.

FUCHSIA DOMINIANA.—A beautiful example of this truly gorgeous plant was exhibited at 21, Regent Street, on Tuesday last, and without any exaggeration it may be said to have been the admiration of every one. There is now no doubt that it is one of the finest autumn and winter flowering conservatory plants we have. The merit of raising this beautiful plant is due to Mr. Dominy, the Foreman of the Plant Department at the Exeter Nursery; it consequently bears his name as a memento of his zeal and ability in the performance of his duties. It is a seedling between Serratifolia multiflora and spectabilis, having the fine free growth of the former and the splendid flowers of the latter.

A few extra strong specimen plants, 2 to 3 feet ... 21*s.* 0*d.*
Fine large plants 10 6
Small Plants 7 6

Exeter and Chelsea Nurseries, Nov. 11.

N.B. The specimen exhibited on Tuesday can be seen at Chelsea.

SONERILA MARGARITACEA.—This lovely Plant was exhibited at the Horticultural Society Rooms, 21, Regent Street, on Tuesday last, and was the gem of the exhibition. (See report in *Gardeners' Chronicle*). It is perhaps the most chaste of all variegated plants, producing, with its dark glossy green leaves, dotted all over with silvery white spots, a profusion of beautiful crimson flowers, with yellow stamens. It is a dwarf compact plant, of particularly neat habit. It requires the temperature of a cool Stove or a warm Greenhouse.

Messrs. VEITCH & SON are now prepared to supply plants of the above, and have no hesitation in saying that this is one of the most lovely and delightful little plants it has ever been their good fortune to introduce.

Plants at 21*s.* each, with one over on three to the Trade.

Nurseries, Exeter and Chelsea, Nov. 11, 1854.

N.B. The Plant exhibited on Tuesday is now at the Exotic Nursery, Chelsea, and can be seen by the public.

TO THE SEED TRADE.

BEAUTIFUL NEW CALIFORNIAN ANNUALS.

MESSRS. VEITCH AND SON are now prepared to supply SEEDS of the following recent introductions which were sent them by Mr. Wm. Lobb, and are at present solely in their own possession. They are certainly three lovely additions to our hardy Annuals, and cannot fail to give general satisfaction.

ESCHOLTZIA TENUIFOLIA.

This lovely dwarf Annual is peculiarly adapted for forming masses, or for Edgings to beds. It is of a delicate clear straw colour, of neat compact habit, about 9 inches in height; its foliage being small and producing its flowers in abundance at the same time, renders it very attractive.

It was exhibited at the last July Chiswick Show, and had the FIRST CLASS CERTIFICATE awarded it.

Dr. Lindley in the report of this show, in the *Gardeners' Chronicle*, of July 15, describes it as—"The charming Esch. tenuifolia, quite different from the old species, dwarfer and neater."

It is figured in Curtis's "Botanical Magazine," Oct. 1854.

LEPTOSIPHON AUREUM.

This very pretty little plant is of a BRIGHT GOLDEN COLOUR, dwarf compact habit, is VERY SHOWY, and has a BEAUTIFUL EFFECT in small beds.

It is also well adapted for growing in pots or boxes for GREENHOUSE DECORATION. It was exhibited at Chiswick on the 3d of June last, and had the Silver Knightian Medal awarded it.

It is a Californian species, and is altogether distinct and VERY SUPERIOR to Leptosiphon luteum.

WHITLAVIA GRANDIFLORA.

This very fine thing has LARGE DARK VIOLET bell-shaped flowers, which are produced in abundance.

It is figured in the October number of Curtis's "Botanical Magazine," and the following is what Sir William Hooker says of it:—

"This BEAUTIFUL ANNUAL has ATTRACTED the ATTENTION of ALL LOVERS of Horticulture at the Chiswick Exhibitions of the present summer (1854), having been sent by the Messrs. Veitch, from their Nurseries at Exeter, and King's Road, Chelsea. The seeds had been the year before sent home from California by Mr. William Lobb.

Dr. Lindley, in his notices of new plants in the *Gardeners' Chronicle*, of Oct. 21, describes it "as THE GEM OF THE SEASON IN THE CLASS OF HARDY ANNUALS."

It was exhibited at Chiswick in July last, and had a First Class Certificate awarded it.

Prices of the above will be forwarded to the trade on application.

Nurseries, Exeter and Chelsea, Nov. 11.

CHOICE NEW CERANIUMS, &c., AT REDUCED PRICES.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, having a large stock of the following NEW GERANIUMS in 4-inch pots, good, strong, healthy, well-established plants, begs to offer them, at purchaser's selection, 36*s.* per dozen, viz.—Empress, Leah, Neatness, Picta, Rebecca, Marginata, Eliza, Helen, Glow-worm, Virginia (Hoyles), Attraction, Purple Perfection, Indian Chief, Majestic, Regalia, Governor-General, Carlos, Zeno, Tamberlik, Rosa, Lucy, Duchess of Wellington, and Rhoda. Choice varieties of 1853, strong plants, 15*s.* per dozen. Fine old show varieties, 6*s.*, 9*s.*, and 12*s.* per dozen. Fine spotted French varieties, which are very showy and attractive, 2*s.* 6*d.* each. Choice fancy varieties, 9*s.*, 12*s.*, and 18*s.* per dozen.

CINERARIAS, from a collection of more than 100 of the best varieties, new of last season, 18*s.* per dozen; choice older varieties, 6*s.*, 9*s.*, to 12*s.* per dozen.

PANSIES, of which H. W. has several thousands of plants of the best in cultivation, 4*s.* 6*d.*, 6*s.*, 9*s.*, 12*s.*, and 18*s.* per dozen.

CARNATIONS AND PICOTEES, fine show varieties, 9*s.*, 12*s.*, to 30*s.* per dozen pairs, or 25 pairs for 21*s.*

HOLLYHOCKS, including the best varieties out, 6*s.*, 9*s.*, 12*s.*, to 30*s.* per dozen.

All the newest and best FUCHSIAS of this season, 1*s.* 6*d.* and 2*s.* each, or 18*s.* per dozen.

VERBENAS: new varieties of this season, 1*s.* each, or 9*s.* per dozen.

PETUNIAS: new varieties of this season, 1*s.* 6*d.* each, or 15*s.* per dozen.

Also a large collection of FERNS AND LYCOPODS at very low prices. Parties intending to make a select collection would do well to inspect H. W.'s catalogue.

Collections of STOVE AND GREENHOUSE PLANTS at reduced prices.

CINERARIA SEED from the best varieties, 1*s.* 6*d.*, 2*s.*, and 2*s.* 6*d.* per packet, post free.

Descriptive Lists of the above now ready, and may be had for one postage stamp. A remittance is respectfully requested from unknown correspondents, made payable at Marsden, Lancashire.

EXTRAORDINARY POTATOES.—"A variety of Potatoes, singled out from some grown three or four years ago, has this year produced on the land of the Thingoe Union-house about 31 sacks, of which only three pecks are bad or small, and 60 Potatoes measure a bushel, weighing 60 lbs. Two have been brought to us weighing together 3 lbs. 2 oz. It is an excellent mealy Potato, and an abundant bearer."—*Bury Post, October* 11, 1854.

This really extraordinary new variety has been christened the "Lord Raglan," and they are now ready to send out, price 2*l.* 2*s.* per sack of 2 cwt. An early application will be necessary.

Also "Jackson's Improved Early Ashleaf," and the celebrated "Short-top," price 9*s.* and 7*s.* 6*d.* per bushel; and the British Queen, price 7*s.* 6*d.* per bushel; the earliest round variety known, ready to take up in May and ripe in June. Free to London, and no charge for sacks.—Apply to JOSEPH WILSON, Seed Merchant, Ipswich.

DUTCH HYACINTHS, for Forcing, single and double, at 4*s.* per dozen. Also Narcissi, Crocuses, Tulips, Irises, Jonquils, Anemones, and Ranunculuses, priced Catalogues of which will be forwarded by post, from ARTHUR COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall.

Also Double Roman and Paper White Narcissus, the most beautiful and fragrant of all the Narcissi, 4*s.* per dozen.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50*s.*; 50, 30*s.*; and 25, 16*s.* Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5*s.* per 100.

Manor Farm, Deptford, November 11.

JOHN CATTELL, NURSERYMAN, Westerham, Kent, begs to inform the Trade that he has a large stock of the following articles to offer, worth their attention; prices of which may be had on prepaid application enclosing a penny stamp.

Delphinium Barlowi	Œnothera macrocarpa
Gladiolus brenchliensis	Wahlenbergia grandiflora
Anemone pavonia	Spiræa callosa

Late and Early Dutch Honeysuckle
Hardy Azaleas, of the finest sorts.
Red Raspberries do. do.
Gooseberries and Currants, do.

JOHN CATTELL, Westerham, Kent, begs to inform the public that his Descriptive Priced CATALOGUES of his extensive collection of NURSERY STOCK for the current season, are now ready, and may be had on application, enclosing a penny stamp for each, excepting Catalogue No. 10, which will require two penny stamps.

CATALOGUE No. 6.—GRAPE VINES, STRAWBERRIES, RASPBERRIES, &c.
" No. 8.—ROSES.
" No. 9.—FRUIT TREES.
" No. 10.—HARDY ORNAMENTAL TREES AND SHRUBS, CONIFERÆ, AMERICAN PLANTS, CLIMBERS, &c.
" No. 11.—FOREST TREES, &c.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to announce that the following New Plants are now ready for sending out by them, viz.:—

HELIOTROPIUM "BEAUTY OF THE BOUDOIR."
CHRYSANTHEMUM "ANNIE HENDERSON."
GERANIUM "PRETTY POLLY," hybrid bedding variety.
ACHIMENES HENDERSONI.

FANCY GERANIUMS.

Cloth of Silver	Evening Star	Crystal Beauty

CINERARIAS.

Mrs. Rogers	Fascination
Mrs. Gerard Leigh	Prince of Prussia

And the New RHODODENDRONS of Assam and Bhootan.

Full particulars of the above will be seen on reference to their Autumn Catalogue, just published, which will be forwarded post free on application.—November 11.

Splendid specimens, 3 to 6 feet in height, at moderate prices, of Deodaras, Araucarias, Cedars of Lebanon, Abies Pinsapo, Menziesi, Douglasi, Pinus Pallasiana, and excelsi. Hardy Scarlet and other Azaleas for forcing, well set. Also Scarlet, Purple, Crimson, and White Rhododendrons. A reference is respectfully solicited from unknown correspondents.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

NEW FANCY GERANIUMS.

JOHN HALLY, NURSERYMAN and FLORIST, Blackheath, begs to offer the following distinct and first-rate Fancy Geraniums, which have been raised by a first-rate grower and highly admired by all judges who have seen them. They are now ready.

1. ENCHANTRESS.—Upper petals deep rosy crimson, with white edge, lower petals having a crimson spot on French white ground; of superb form and a very free bloomer, with dwarf habit. Received a First Class Certificate at the Regent's Park Exhibition, June 21. 10*s.* 6*d.* each.

2. ECLIPSE.—Upper petals deep lilac crimson, with white margin, lower petals having a belt of rosy lilac, with large white eye, and ring of white round the outside. Flower good in shape, and above the average size. 10*s.* 6*d.* each.

3. COMPACTUM.—Upper petals dark velvety crimson, very smooth lower petals, having a crimson lilac spot, with white eye; a remarkably free bloomer, and of dwarf habit. 10*s.* 6*d.* each.

4. MARY JANE.—Upper petals silvery lilac, margined with white, lower petals white, spotted with lilac; new in colour, free bloomer, and of dwarf habit. 7*s.* 6*d.* each.

5. FORMOSISSIMUM SUPERBUM. A Cape cross, pure white, with large mulberry spot on the upper petals; flower of good form and substance. Exhibited June 21st, at Regent's Park. 7*s.* 6*d.* each.

The above set for 2*l.* 2*s.*, with the usual allowance to the trade. A remittance must be made by unknown correspondents. Post-office orders to be made payable at Blackheath.

SUPERB DOUBLE HOLLYHOCKS.

JOSEPH BUTLER, Gardener to R. Hills, Esq., Colne Park, near Halstead, Essex, begs to announce that he has now ready for sending out a large stock of extra strong plants of nearly all the varieties yet sent out; also some superb new varieties of J. B.'s own raising.—Descriptive Catalogues will be sent post free on the receipt of a postage stamp; also Seed saved from J. B.'s superb collection; 150 Seeds mixed for 12 postage stamps. Collections, consisting of well contrasting colours, at 6*s.*, 10*s.*, 15*s.*, and 25*s.* per dozen; if left to J. B.'s own selection good double contrasting colours for Borders, not named, 4*s.* per dozen. A remittance is solicited from unknown correspondents. Post Office orders, payable at Halstead, Essex.

CHRYSANTHEMUMS.

R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's selection at 9*s.* per dozen.

CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4*s.* per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s.* per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s.* per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

NEW CLIMBING HYBRID PERPETUAL ROSE, THE "DUCHESS OF NORFOLK."—Colour, Vivid Crimson.

To be sent out for the first time about the end of October.

WILLIAM WOOD AND SON beg to refer to their advertisement in the *Gardeners' Chronicle* of September 30, page 627. Standards, half-standards, or dwarfs will be supplied at 10*s.* 6*d.* each, with the usual allowance to the trade.

N.B. When six plants or more are ordered by the trade, a very considerable reduction will be made beyond the usual discount, particulars of which may be had on application.

A Drawing of the above may be had for 6 Postage Stamps.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 11, 1854.

WE have seen with satisfaction that the PROFITS OF PEAR GROWING have occupied the attention of some of our correspondents. They could not have selected a better topic; for although some may be in a degree extravagant in their expectations, while others are inclined to doubt the possibility of any pecuniary advantage whatever being derivable from this fruit tree, it will probably turn out that truth lies nearer the statements of the enthusiastic than of the fainthearted. By way of adding our mite to the information procurable on the subject, we venture to introduce a case brought before the meeting of the Horticultural Society on Tuesday last.

The vice-secretary announced that he had received through our office the following memorandum from a resident at Nantwich:—"I send a specimen of Van Mons-Léon le Clerc Pear, of which I have two small trees growing against a south wall (the front of my cottage), one on each side of the door. These trees have produced *half a bushel of fruit*, all of them nearly as large as the specimen sent, which weighs 15 ounces. I have several weighing 14, 13, and 12 ounces."

The specimen received was, he added, quite as fine as the beautiful sample produced by Mr. INGRAM from her MAJESTY'S garden, at Frogmore. So that we have in this instance a proof that in such a season as this, and in such a climate as Cheshire, one of the finest of our autumn Pears is produced abundantly and of the first quality, as regards both size and flavour.

In this case it is clear that the Pear in question must have been grown with such considerable pecuniary advantage that the owner of the trees might have very well afforded them a screen like that employed by Mr. HARRISON, published lately in the "Journal of the Horticultural Society," and reproduced the other day at p. 696 of the *Gardeners' Chronicle*. By such means a crop of fruit may certainly be secured in even our worst seasons. We leave pomological arithmeticians to form their own calculations upon the datum now supplied, and conclude these remarks with the following account of

the Pear in question, for which we are indebted to Mr. Robert Thompson:—

"*The Van Mons-Léon le Clerc Pear* was raised by M. Leon le Clerc, of Laval; and he wished to have the name of Van Mons united with his own in the designation of the fruit. Specimens of it were first sent to the Society by Mr. Langelier, of St. Hélier's. The fruit having been approved of, a number of trees were introduced to this country from Jersey; and it has proved highly deserving of cultivation. It is necessary to observe that it is one of those sorts which do not succeed well on the Quince stock. The tree is a good bearer, but not such a strong grower as the Beurré Diel, for example, and others that bear large fruit. Therefore care should be taken that the tree do not overbear itself. The weight of the fruit individually should be taken into consideration, and the number of fruits that may set in a good season should be reduced accordingly. If the weight of each fruit may be estimated at four times that of a moderate-sized Pear of another sort, then, to give each tree an equal load, the Van Mons-Léon le Clerc should be allowed to bear only one-fourth the number. This is evident enough when the fruit is full grown, but is apt to be forgotten at the time of thinning the young fruit, when that of large and small varieties differs but little in size."

It has been shown on more than one occasion that the white dust which is so abundant in Vineyards affected with mildew, is not the only form of fructification, nor that which is most indicative of the real affinities of the fungus; and the same may be said with equal probability of the mould which at the present moment is powdering every crop of Swede Turnips, though perhaps no one has as yet discovered more than the ordinary Oidioid fruit. A much more surprising fact has, however, of late been made known by M. Tulasne, namely, that the well-known fruit of Botrytis infestans, of which so much has been said in the numerous discussions on the Potato murrain, is not more truly the real fruit of the Botrytis, than are the necklaces of vesicles in the Vine mildew; and the observation may be extended to many allied species, as Botrytis effusa, Grev.;* on Spinach, B. parasitica, which is often a pest on White Turnips; B. ganglioniformis, Berk.; and several others forms.

These moulds, like the various species of Uredo and Puccinia, are essentially parasitic in their habits; not merely developed on unhealthy or dead organisms, but, like true parasites, produced amongst the healthy tissue at whose expense they live. The mycelium traverses in every direction the large intercellular passages on the under side of the leaves, though not confined to these, and fertile threads burst through the stomates, or where these are not present through the cuticle itself. But the vesicles which are borne on the tops of these threads, though germinating readily, are not the only nor the most highly-organised fruit. The proper fructification is contained in large asci, or sporangia, which are attached by a short stem to the threads of the mycelium, and resemble greatly the spores of a Truffle. In all probability the production from the intercellular tissue of the Potato, which is figured in Mr. Berkeley's "Memoir on the Potato Murrain," from drawings by Dr. Montagne, under the name of Artotrogus, in the first number of the "Journal of the Horticultural Society of London," belongs to the same category; also a second species of the genus found by Mr. Broome on Turnips, which may possibly be the asciform fruit of Botrytis parasitica.

The spores are spherical, far larger than the conidia, brownish, with a cellular, warty, or smooth episporium, which separates very readily from the inner membrane.

If the Artotrogus of Montagne be really the perfect fruit of B. infestans, which Tulasne has not yet detected, the episporium is strongly echinulate, as are the sporidia of so many Truffles. Dr. Montagne has long since shown that the sporangia of Eurotium are really ascigerous; and now it is equally certain, from the observations of Corda and De Bary, that from the same threads is produced the ordinary fruit of *Aspergillus glaucus*, the common blue mould. If these observations are multiplied, mycologists will be obliged to modify greatly their present systematic views. *M. J. B.*

The new water weed, *Anacharis alsinastrum*, of which we gave a full account, derived from Mr. Marshall, in our volume for 1852, p. 662, after invading tranquil streams in England, Scotland, and Ireland, has threatened to close altogether the navigation of our canals. No one can wonder that such an enemy should have excited very great alarm, especially since there was no apparent means of destroying it. Even the costly process of removing it by manual labour, was evidently but an unsatisfactory mitigation of the evil. We therefore received with no little pleasure as well as surprise, the following very important communication from a Devonshire correspondent, which points out a certain and costless remedy. We give his statement verbatim:—

"It has at various times been stated that this plant first appeared in the loch of Dunse Castle, Berwickshire, and was detected by Dr. Johnstone of Berwick, in 1842. It has now entirely disappeared; and believing that other lakes may be cleared by the same agents as in this case, I venture to offer you an account of its sudden disappearance. The progress of its growth was not watched particularly at the time; but in 1847, the loch was so completely filled with this plant, that it became impossible to pull a boat through the] water without the greatest exertion.

"At this time there were a few swans upon the loch. Indeed, these birds were accused of having first introduced it. The swans lived entirely upon this plant, and began to increase in the most unusually rapid manner. In 1848, as well as I can recollect, one pair of birds raised a brood of seven young. Three pair raised broods of *five* each, besides *several* pair which reared respectively three and two young.

"By the year 1851 or 1850, I forget which, the lake was entirely, or at least nearly so, cleared of every appearance of the Anacharis alsinastrum, and then the swans began to die. Mr. Hay had them fed with corn and vegetables, but nothing seemed to save them; they gradually began to pine, and are now reduced to the original number of a few pair. But for the last three years there has not been one single leaf of the weed seen in the loch, so completely have the swans eradicated it from the water. They follow the small burns down to the Whittadder in search of it, and appear to be its most relentless persecutors.

"This is so curious a fact, that I imagine some of your correspondents may like to try the same cure for this troublesome pest; for no other means I ever saw tried exercised even the least influence towards eradicating it. I think last season the swans did not hatch one, or certainly not more than one young bird; as well as I remember there was not a single nest, or as I say, not more than one." *J. B. G., Devonshire, Nov.* 1, 1854.

VEGETABLE PATHOLOGY.—No. XLV.

198. Though the abnormal states noticed above may answer the end of the cultivator, and therefore cannot enter into his notion of diseases, they are, nevertheless, occasionally, either in themselves or in their consequences, most decided diseased conditions. Present purposes may, for instance, be answered by the use of high manures in the production of large weights; but either inferior quality, or a tendency to decay, will be increased in a still higher ratio, as in the enormous increase sometimes effected by large doses of guano: and, on the other hand, it appears evident that the disease called curl arises from the over-production of fecula in the tubers of Potatoes, to the exclusion of such a portion of albuminous or fibrinous matter as may be necessary to convert the starch into sugar or other soluble matters, for the proper germination of the tubers. Such a state is clearly in itself a diseased state, though it cannot be so considered, as regards the purposes of cultivation, provided such tubers are employed simply for nutriment, and not for reproduction.

199. The same principle applies equally to fruits. The ultimate end for which abstractedly the whole organisation of plants is contrived, is the reproduction of the species. Doubtless their several intermediate products were prepared for the nourishment of other members of the natural world; but such ends could only be secured by the repeated reproduction of the species by seed, and improvements of any particular quality can be attained in any general way by no other mode of propagation. Anything, therefore, which tends to repress such reproduction altogether, is essentially of the nature of disease. Such, however, to a great extent, are the improvements which have been effected in the Mulberry and wild Fig tree by cultivation, insomuch that millions of fruits are ripened every day, not one of which contains a perfect embryo. And yet, in treating on vegetable pathology, we must restrict our language so as to exclude such cases.

200. Certain fruits, such as the Medlar, Service, &c., are too harsh to afford palatable or wholesome food till they have undergone a peculiar process, to which has been given the name of bletting. Varieties or states which do not blet are absolutely worthless, and therefore the gardener looks forward to this change with just the same interest with which he expects in due season the perfect ripening of his Pears and Apples, which is essentially a chemical process, which may be promoted by a proper temperature, or wholly prevented by undue cold. Now it sometimes happens that his Apples will blet by precisely the same process as that which has taken place in the Medlars; and some kinds of Pears are so subject to undergo this change, that they retain their proper flavour a few days only after they are gathered. In all these cases the process is actually a kind of decomposition, partaking of the nature of disease; but in the first the gardener never would allow the existence of a diseased condition, because the promotion of such a tendency is the very point at which his skill is directed.

201. Still more must we restrict our definition when we take into consideration the numerous objects which occupy the time and anxiety of the florist. In the field we do not hesitate a moment to consider what are commonly called monstrosities as so many cases of vegetable pathology. If, for instance, we meet with Clover in which sepals, petals, carpels, and ovules are represented by leaves of the normal form and nature, though differing in size, disease is recognised without hesitation; and so in numerous other cases. But the very object of the florist is to produce flowers differing from the normal form, and multiplying the sepals or petals at the expense both of the male and female organs. If the flowers revert at all to their normal state, or if the multiplied organs, instead of assuming the nature of the especial floral envelope on which their beauty may depend, lose their bright colours and return to the natural green of the parts of which they are mere modifications—or if, instead of forming a compact whorl, they are scattered here and there in a spiral direction round the stem, as is the case not unfrequently when the Tulip is planted in over-manured soil, they are at once pronounced diseased; and so they are for the purposes of the cultivator.

202. We must not therefore regard every deviation from the normal condition of species as disease; but, for the purposes of vegetable pathology, the peculiar attributes of each individual variety or variation, and the ends which they are intended to answer, must be taken into consideration: and so long as their distinguishing characteristics are maintained, they are to be considered as healthy; while deviations from these conditions will rightly be considered, as far as they are concerned, of the nature of disease. In all cases where the necessary functions of the species, or other vegetable form, are impeded, and vital action is impaired, whether tending to actual decay or to the obstruction of the main ends of cultivation, we must assume that diseased action is going on, and, if possible, we must suggest the proper remedy. *M. J. B.*

RADIATION.

The production of frost may be traced to the radiation of heat from the earth.

By radiation is meant the power possessed by bodies on the surface of the earth of sending forth their heat into space.

It appears to be the means provided by nature for parting with the superfluous portion of the sun's heat, which would otherwise accumulate in the air and soil of our planet.

It is not only the surface of the ground which has the power of radiation;—the leaf which flutters in the breeze, and the particle which floats in the air, shoot forth their heat into space; and probably the air itself, in proportion to its density, radiates its heat.

The process goes on equally by night and by day, in the breeze and in calm; but it is rendered sensible chiefly on the clear calm night. It does not appear that the range of temperature to which our planet is subject has much influence over this power, which proceeds in much the same rate, whether the thermometer be at 80° or 32°. These cold-producing rays (if the term be allowable) are obstructed in their course by the intervention of opaque bodies; so that, when the sky is densely covered with clouds, radiation ceases.

But such is the power of unobstructed radiation that, were it not for the sun's heat being accumulated during the day in the soil, and given out to moderate the temperature by night, our thermometer would probably sink to zero every clear calm night.

This natural reservoir of heat is therefore the great moderator of frost. Very severe frosts occur when the ground is deeply covered with snow, and the heat of the soil is thereby kept in, and prevented from communicating its salutary warmth to the air. In proof of this I refer to letters 60, 61, 62, in White's "History of Selborne," and to Howard's Meteorological Tables and Remarks.

A thermometer placed on the snow in my garden, on the night of January 2d, 1854, sunk 2° below zero; when another placed on a small patch of ground, which had been kept clear from snow, only 2 or 3 feet distant, did not sink below 16°.

I think it is clear from this experiment that, had the whole of the snow from my garden been removed, the temperature would have been raised 10° or 15° above that which existed, and which proved very destructive to my shrubs; or had the snow been gathered into stacks like hay, and each stack placed on a part of the garden where roots required protection, the double advantage would have been gained of protecting them, and releasing the heat of the soil.

It should be borne in mind that frost is most severe on clear calm nights, and that the degree of cold depends much on local circumstances. As a general rule, it may be stated to be the effect of radiation *minus* the previous heat of the air and surrounding objects,

* This is very recently noticed in "Botanische Zeitung," Aug. 11, 1854, as a new species discovered by Dr. Caspary, under the name of Peronospora Chenopodii, though described years ago by Dr. Greville, and figured by Desmazieres in the second series of "Annales des Sciences Naturelles." The commonest species are too often in this way brought forth as novelties in Germany, to the great detriment of science.

and also the heat of the soil if not covered by a non-conducting body. Indeed, a practical observer may calculate pretty accurately from these elements the temperature of any clear calm night before examining his thermometer in the morning.

But it should also be remembered that cold is chiefly generated on the surface of the ground, the air near the surface being colder than at 3 feet above it; and the cold air being heavier sinks down slopes into valleys, obeying slowly the same laws which regulate the motion of the heavier fluid water.

A thermometer placed in the bottom of an artificial valley or basin of 9 inches deep, and 3 or 4 feet wide, well protected by cotton, wool, or some non-conducting substance, from the heat of the earth or soil will sink 25° to 50° below the temperature of the air around from simple exposure to the clear blue sky on a calm night. *S.*

JUSTICIA SPECIOSA.

Notwithstanding that this plant is hardly surpassed for easy culture, and that it produces a long succession of showy flowers in the dead of winter, it is scarcely ever met with save in a neglected state—the result, no doubt, of its having been long common in collections. Its management is so thoroughly easy that it is hardly necessary to make it the subject of an article; and it is chiefly with the view of directing the attention of those to it who are fond of winter-blooming plants that it has been selected; and there can be no doubt that amateurs will find it well worth its room, and the little attention necessary to grow it well. As usually met with this Justicia presents a leggy, naked appearance; and it is frequently seen in this state where better things might be expected; but this is entirely the result of bad treatment, for the habit of the plant is good, although like other free growing subjects it is apt to lose its bottom leaves and become leggy under bad management. Cuttings root in a few weeks, inserted in sandy soil, and placed in a gentle bottom-heat; but in order to secure large specimens for blooming after a season's growth, the cuttings should be put in about August, so as to allow of having them rooted and well established in small pots before winter. They should be potted off singly in small pots as soon as they are fairly rooted, and placed near the glass in a moist, rather shady part of the stove, or a warm pit, pinching out the points of the shoots as soon as the roots get hold of the soil, and stopping must be attended to during the growing season.

In winter, place the young plants in any roomy situation near the glass where the temperature may range towards 50°, and keep them properly supplied with water at the root. About the beginning of March, or as soon after this time as convenient, remove them to where a growing temperature of about 60° is maintained by artificial means, allowing it to rise 10° or 15° with sun, heat, and air. Shortly after placing the plants in heat give them a moderate shift, using about equal portions of good rich turfy loam, peat, thoroughly decomposed cow dung, or leaf soil, and sharp sand, well intermixed together. As soon after potting as the roots appear to have started into the fresh soil, stop the shoots and tie them nicely out, keeping them well down, which will have the effect of causing the bottom buds to start into growth, and inducing a bushy habit of growth to begin with. As the season advances, and the plants get into free growth, give air freely on mild days, and keep them near the glass. Towards May they will probably have filled their pots with roots, and may then be afforded a liberal shift, and this should not be neglected until the plants suffer for the want of pot room and lose their foliage. The same attention to tying out the shoots will be necessary, as recommended after the previous shift, and the plants should be well supplied with water at the root, and also moistened overhead with the syringe on the afternoons of fine days. When summer weather occurs, the plants may be removed to a cold frame or pit, which can be kept rather close and moist, which, with a little management, will form an excellent situation for them during the summer. A thin shade will be useful for a few hours on the forenoons of very hot days, but this should be used sparingly, and air should be given freely, shutting up early in the afternoon after syringing. Attend to stopping and training, &c., as the specimens advance in growth, and as soon as they appear to require more pot room shift into the flowering pots.

If large and fine specimens are desired, they may now be afforded 15-inch pots, which will be sufficient for very large bushes; or 12-inch pots if only moderate-sized specimens are wanted, with the assistance of manure water, will be sufficiently large. Keep the shoots regularly stopped and tied out, as may be necessary to secure close bushy growth, till about the middle of September, after which they should not be stopped; and if the weather begins to prove unsettled, remove them to a light airy part of the stove, or where they can have the assistance of a little fire heat. Give them a liberal supply of manure water after the pots are supposed to be full of roots, and turn them partly round every week, to prevent their growing one-sided. The specimens will commence flowering from the beginning to the middle of December, and will continue to produce an abundant succession of their bright-coloured flowers throughout the winter and great part of the spring, but they must be afforded a temperature of from 50° to 60°, keeping them near the glass, and out of the way of cold draughts, for although the plant will exist and bloom in the ordinary temperature of the conservatory, its foliage gets discoloured, and it is never seen in perfection save in a somewhat warmer temperature. When the specimens become shabby in spring, they may be severely cut back and stored away in any spare corner of the greenhouse, keeping them rather dry at the root for a month or six weeks, removing them to a warmer situation by the beginning of June, to induce growth. Turn them out of the pots as soon as they start into growth, and reduce the balls sufficiently to allow of repotting in the same sized pot, and keep close and moist until they get over the operation, treating them during the remainder of the season as directed above, and they will form specimens of any desired size before winter, and will bloom even more freely than young plants. *Alpha.*

Home Correspondence.

Hybrid Rhododendrons.—Possessing a tolerable collection of these most magnificent evergreens, I have been anxious to add to my stock some of the most approved novelties. On enquiry, however, I find that almost all the plants now offered for sale by those who profess to cultivate them are grafted, and, consequently, for most purposes useless. The Indian hybrid Rhododendrons are plants of large and luxuriant growth, in fact tree-like shrubs, but when grafted on any of the shrubby Rhododendrons they are necessarily stinted, and cannot fail to be short-lived. Grafting is a very legitimate mode of inducing a newly raised species to flower early to test its quality, but a grafted plant is valueless in a shrubbery, and can never exhibit its true character. I would therefore caution all cultivators of American plants to reject these grafted absurdities. Very little longer time is requisite to produce layer plants than is expended in grafting, but grafting admits rather more abundant propagation, and is therefore adopted. Grafted plants, however, cannot ever become ornamental bushes. Some patience is required with the hybrids, which possess more or less the tree-like character of their Indian parent, but when once they come into flower nothing can surpass their beauty, and they equal the growth and stature of the Portugal Laurel. I trust all your readers who possess gardens, in which they can give reasonable room to hybrid Rhododendrons will steadfastly reject grafted plants, which are fit only for pots, or for gardens where a specimen must be bred on the smallest possible scale. As far as my experience goes, there is great variety in the hybrids; those which most resemble the true arboreum in foliage being generally the finest in flower. I have some which equal arboreum in colour, while they equal, if they do not surpass R. Catawbiense in size. These, however, had not begun to flower till they were 12 or 14 years old. The smaller hybrids allied to R. Ponticum flower when much younger. *J. R.*

Vine Borders.—I have just made a new Vine border, 25 feet long and 8 feet 6 inches wide; at proper distances apart, brick on edge walls run across it from the house to a pigeon-holed wall which has been built along the front of the border, and outside of which is a trench 18 inches wide and 16 inches deeper than the border, for hot dung. The roots of each Vine have thus a box for themselves, concreted at bottom, and in winter covered over with wooden shutters. My plan is—1st, to prevent the roots from entering into the cold wet subsoil; 2d, to prevent a strong growing variety from encroaching upon its weaker neighbour; 3d, in case of accident, disease, mistake in name, or any other cause, to enable me to plant a young Vine without injury to the roots of the other plants; and, 4th, to keep up, with comparatively little trouble, an even congenial temperature of the roots, which cannot be so easily done by means of tarpauling and other materials used for the same purpose. I do not know whether my plan is new or old, but, be that as it may, I see no reason why it should not be universally adopted, except for the extra expense which it involves. This, however, need scarcely amount to an objection, as the following items will show:—

6 hundred bricks	£0	18	0
95 feet deal, 3½ by two inches	0	13	6
Lime, sand, and nails	0	7	6
430 feet 1-inch deal, for frame and shutters ...	4	18	6
2 dozen small cast-iron rollers	0	3	0
	£7	0	6

The shutters might be made by gardeners in wet weather. The rollers mentioned in the above items are intended to be fixed on the undersides of the shutters, so as to facilitate their being moved backwards and forwards. The joints or seams of the shutters should be filled with tow, and the whole well tarred, and made as air-tight as possible. The frame for the shutters should be at least 1 foot deep, and should have a fall of 12 inches towards the front completely and closely covering the fermenting material in the trench. The bottom of my border has an inclination of a foot towards the front. After it has been smoothed, gas tar is spread over it, and coal ashes finely sifted are laid on, and well trodden and rammed before the soil is put in. *Anxious.*

Effects of the past Winter in the neighbourhood of Clonmel.—In the following list those plants marked thus * have been killed, those marked thus † have had their young growth destroyed by the frost of April 24, and the rest were untouched:—*Abies Brunoniana, the only plant killed; †A. cephalonica, A. Menziesi, A. orientalis, A. Douglasi (one plant 40 feet high), and A. Smithiana or Morinda (three plants in our horticultural garden untouched, but two in the neighbourhood very much injured on 24th April); Picea amabilis, P. nobilis, †P. Webbiana, and †P. Pichta; Pinus insignis, halepensis, and Laricio; Cupressus funebris, excelsa, lusitanica, and Whitleyana; Juniperus excelsa, chinensis, glauca, and lycia; Thuja filiformis, flabelliformis, and aurea; Taxus elegantissima, and adpressa; Libocedrus chilensis, †Araucaria braziliensis, Cedrus Deodara, †Salisburia adiantifolia (17 feet high), †Pawlonia imperialis (14 feet high), †Ailantus glandulosa, †Robinia Pseud-acacia, †Sweet Chestnut, †Walnut, †Fig; Escallonia macrantha, a very high-coloured variety, perfectly hardy. The following were untouched by a smart frost last week:—Garrya macrophylla (perfectly hardy), Forsythia viridissima, Photinia serrulata, Pittosporum Mayi; Berberis Darwini, dulcis, empetrifolia, macrophylla, and ilicifolia; Magnolia macrophylla; Ilex dipyrena, rotundifolia, and †perado (this was a very large plant which suffered from recent transplanting, the growth was very young); Ilex dahoon, nobilis, and all the common kinds and varieties. Sweet Bays, Laurels, Portugal Laurels, Laurestines, and Myrtles, all untouched; and large beds of Rhododendrons, containing mundulum, campanulatum, and many of the early-flowering scarlet hybrids, with Ghent and other Azaleas, suffered very little on the 24th April. *W. D. H.*

Araucaria excelsa.—I have a fine plant of this Araucaria, which I planted out in the open border in the first week of last April, without any protection whatever. It withstood the severe frost of the night of the 24th of that month perfectly uninjured (except that it browned a few of the leaves), although immediately adjoining it the shoots of the Ash and Walnut were quite destroyed. It is now in very fine health, and has made good growth. The April frost alluded to was the most severe ever remembered at the time of year in this locality, and did a vast amount of damage. I have a nice collection of Conifers, specimen plants, all of which stood the last very severe winter perfectly uninjured, except Abies Brunoniana and Daurica, which were quite burned, but not otherwise hurt. In an establishment which is not quite half a mile from mine, the Pinus, Abies, and Deodars, although planted in a damp situation, were hardly injured, the foliage being only burned. *Thos. Jones*, 83, *Grand Parade, Cork.*

Lapageria rosea.—Although I am aware that the flowering of this beautiful plant is no novelty, I cannot resist sending you a description of one which is now in bloom in one of the greenhouses of Robert Hanbury, Esq., of the Poles, near Ware. It is a beautiful specimen, and unquestionably one of the finest greenhouse climbers in cultivation. The plant in question has at the present time 19 of its exquisite blossoms fully expanded, and six more to open. It has been in flower for these six weeks past, and is likely to continue for a month to come. Its profuse blooming, contrary to what was anticipated, and its delicately mottled carmine blossoms, admirably relieved by its fine glossy foliage, render it a most attractive object, and well deserving a place in every collection where suitable accommodation can be found for it. The soil I use for it is leaf-mould, turfy loam, and peat in equal parts, with a few potsherds, and a little sand. The plant here is in an 11-inch pot, standing on a platform, and trained along a wire across the house about 9 inches from the glass. *L. Hume, Poles, near Ware, Nov.* 2.

Pear Culture.—Having read the valuable remarks on Pear-growing by M. De Jonghe in your late numbers, and also those of "H. S. H.," I have come to the conclusion that they have neither of them got to the root of the evil; but if Mr. De Jonghe's instructions are properly followed, there can be no doubt that Pear trees may be made to bear as well in England as in Belgium. Many Pear trees bear well one season and not at all the next, which is in a great measure owing to the careless gathering of the crop; instead of waiting until the fruit has arrived at maturity, and parts freely from the spur, without damaging it, they are in a great many instances taken before they are fully ripe, and the stalks not parting freely take with them the next year's crop, in the shape of blossom-buds, or in some cases the fruit is shaken off, and the fruiting buds either knocked off or damaged; and still the parties unreasonably expect a crop. Of course experienced fruit-growers would not act as I have stated. The failure of Pear trees must, however, be attributed to a greater evil, which is the root of the tree and the soil in which it is planted; we see the trees planted in strong and light land, wet and dry, and the evil is much the same; no fruit is produced except under peculiar circumstances. To be sure the trees grow well enough, rather too well, in the shape of useless breast-wood on wall trees, and vigorous shoots on standards, and the more vigorously they grow the sooner they commence to decay, the end shoots cankering and dying off. In some instances they flower abundantly, but the blossom falls without setting, which is by some attributed to our climate, or spring frosts; but a greater evil, as I have said, is the soil, and the manner in which they are planted. When a Pear tree is planted in the ordinary soil and manured, as is usual, you find it to commence growing rapidly and its roots to speedily descend into the subsoil; then commences the mischief; they have got into a cold element out of the influence of sun and air; as the soil is, so is the tree, either producing a rapid growth and not ripening its wood, or forming fruiting buds or cankering gradually until it dies off entirely. This evil is to be guarded against by following my instructions when planting young trees in either strong or light land. As for old trees which do not bear, the sooner they are burned the better. In planting either wall trees or open standards, the soil should be taken out two feet deep, and a layer one foot thick of brickbats and lime rubbish should be placed in the bottom, then add one foot of fresh turf, which will bring the soil up to the common level; on the top of this must be placed 2 feet

thick of one-third whinstones, or any common open stone, and the remainder well decayed manure and turf, the three mixed together; this will raise the border 2 feet above the level. If for standards, mounds should be formed, 6 or eight feet in diameter, in which the trees must be planted (not deep) and pruned as Mr. De Jonghe has directed. Every autumn the border must have a top-dressing of well decayed manure, forked lightly in, not dug, or the fibres will be injured. The great object is to attract the fibres to the surface, and prevent them descending into the subsoil, which is the ruin of them. The wood produced will not be so strong and rampant, but it will get thoroughly ripened, and very soon form fruit buds, which will not fall; the fruit will be better flavoured, and, in the case of many kinds, will be produced the second year plentifully, but the tree must not be allowed to bear too many at first. The trees, in a dry summer, will require watering two or three times during the season, as the stones will have a tendency to drain them. Always remember, when you water, to do it effectually. By attending to these instructions, and Mr. De Jonghe's pruning, success will be secured in any part of England, and that even in the case of the finer sorts of Pears. *Henry May, the Hope Nurseries, near Bedale, Yorkshire.*

Late Strawberries.—On the 31st October I gathered from a plant of the Roseberry kind, in my garden, a Strawberry of fair average size, well flavoured, and of fine crimson colour throughout its entire substance, but not so sweet as it would have been earlier in the season. At the date I write this there is another plant of the same kind, with a fruit stem having on it three Strawberries approaching maturity, or beginning to colour, and 10 more in different stages of growth, besides flower-buds. As might be expected at this advanced period of the year, the Strawberries are not of the full size they would have been in summer. My object in stating these particulars is to contrast this Strawberry with the Alpine, several plants of which are growing within a few yards of the same spot. On the latter the Strawberries have ceased for three weeks past to make any growth: they are small, stunted, half-coloured, and quite hard, and have only a sourish taste without the slightest flavour. Now, the chief property of the Alpine is, that it continues to flower and bear fruit through the entire season till stopped by the frost, for the fruit itself is quite inferior to any of the garden kinds. But from what I have said above, it is evidently incapable of perfecting its fruit under the same conditions of temperature that the Roseberry is capable of doing. The latter, it is true, is properly one of the early kinds, and its general crop is over in July and August in the neighbourhood of Edinburgh; but many plants, and even many rooted runners of the same season, throw up flower stems to a very late period. Would it be possible to take advantage of this peculiar property to obtain a late general crop, long after all other kinds have disappeared? *J. H. H., 7th November.*

The Winter in the far North.—There was an influence at work last autumn and winter of a very mysterious character, which I cannot explain, and I don't know who can. It was not frost, but its effects were generally attributed to frost. I observed it first in December, immediately after a shower of sleet and snow, on the Scotch Pines. While the snow was still white on the trees, a great many of the lateral twigs hung down apparently broken; some appeared twisted, others did not, but all appeared very feeble, yet they were green though somewhat faded. About a fortnight previously to that time a violent hurricane had visited the country, and at the time I set the casualty down to the rough weather that had dashed and bruised the twigs. In course of a month or two the twigs became paler in colour, and ultimately assumed the brown colour of dead Scotch Fir branches. Hollies suffered in the same way, and throughout the North on all trees much exposed to the north and north-west the effects of the visitation were, and still are, very perceptible. In no case did I see a top Scotch Fir shoot affected, though in some cases half the twigs and foliage of the tree were destroyed. I examined many cases — several instances 100 miles apart—and the uniformity was very remarkable. The most severe cases I saw were those of a few Scotch Firs, standing on the verge of a fresh water lake, situated almost 700 feet above the sea, and I question whether those trees will live another year. I do not think it was the snow that had any unusual effect on the Pines that led me to notice the circumstance, further than that it weighed down the feeble twigs, rendered feeble by something that had passed over them previously. The Garrya elliptica luxuriates to my knowledge 1200 feet above the sea, and last spring I saw some plants injured by the influence to which I refer (not frost), and alongside of these Garryas some plants of Laurustinus were scatheless. *G. Forres.*

Societies.

Horticultural, *Nov.* 7.—E. Brande, Esq., in the chair.—N. Malcolm, Esq., was elected a Fellow. A large number of very beautiful objects of exhibition was produced on this occasion. Messrs. Veitch contributed a charming collection of Orchids, consisting of Aerides suavissimum, Angræcum bilobum, four nice plants of Barkeria Skinneri, the graceful Calanthe vestita, together with its more handsome rosy-eyed variety, and an example of the Blue Vanda (V. cærulea), which is one of the most useful early winter flowering Orchids we possess. A Silver Knightian Medal was awarded. The same firm also sent two magnificent plants of Fuchsia Dominiana, a hybrid raised between F. serratifolia and spectabilis, and, whether for pot culture or for planting out in the border of a conservatory, nothing could possibly be handsomer at this season than this fine variety really is; for, while it has all the brilliancy and size of flower and grandeur of foliage of F. spectabilis, it is far more cultivable, and blooms as freely as any of the common sorts, which F. spectabilis does not. It must therefore be considered a great improvement on that Peruvian species. Along with the above was another hybrid Fuchsia raised between F. simplicicaulis and serratifolia and named pendulina. It resembles most the last named parent; but appears to be a freer bloomer. A certificate of merit was awarded for these Fuchsias; a similar award was also made to Sonerila margaritacea, a new species, fully described in another page. From the same eminent firm also came a pot-ful of cut specimens of a variety of Pernettya mucronata called speciosa. They were thickly covered with multitudes of purplish violet-coloured berries, about the size of Black Currants, and were sent to show how beautiful the appearance of bushes of this plant so ornamented is at this season of the year. From Messrs. Wood and Ingram, of Huntingdon, came an extremely well-grown and beautifully flowered specimen of Cypripedium insigne, for which a Certificate of Merit was awarded, and Mr. Woolley, gr. to H. Bellenden Ker, Esq., had a Banksian Medal for plants of Pleione maculata and Wallichi, two charming little Orchids which decorate the hills of the north of India, something in the way in which Crocuses do our borders here in spring. Both species are extremely beautiful, and they are so easily managed that any person having a greenhouse, or even a pit to rest them in after they have made their growth, and a small stove to start them into flower and perfect their leaves, might grow them in perfection.

Of Chrysanthemums there were several beautiful exhibitions. The best was that from Mr. Robinson, gr. to J. Simpson, Esq., of Thames Bank, Pimlico. It consisted of the Pompones, Drine Drine, Model, Poudilette, Autumnum, Rose Pompone, Surprise, Solfaterre, Delicatum, and a beautiful large flowered yellow kind called Chevalier. These were dwarf, medium-sized, beautifully flowered plants, and were awarded, as they well deserved, a Silver Knightian Medal. The next group in point of merit was furnished by Mr. Mockett, gr. to J. Allnutt, Esq., of Clapham. This consisted of Sacramento, Adonis, Surprise, Fenella, and Solfaterre. A Banksian Medal was awarded.—Messrs. Veitch also had a nice set of Pompone varieties, among which were large and beautifully flowered plants of Surprise, delicatum, Le Naine Bebe, Sacramento, and Model. Finally, Messrs. Chandler, of Vauxhall, furnished plants of the following: Model, Sacramento, Adonis, Argenteum, Ninon, Solfaterre, Surprise, Hendersoni, Dupont de l'Eure, a brown sort tipped with yellow, Gerelda, white with a brownish centre and very pretty, Ranuncule, and Bixio. The above were all finely in flower, and made, as might be expected, a grand display.

Of other kinds of plants Messrs. Henderson, of Pine-apple Place, contributed a small collection, in which were the large-flowered variety of Lantana alba, Ixora crocata, a very good Statice Holfordi, a flowering plant of Acacia oleæfolia elegans, Leschenaultia formosa, and the seldom-seen Polyspora axillaris, a plant with long shining deep green leaves and large white flowers filled in the centre with yellow stamens. A Silver Knightian Medal was awarded for this and the other plants. The same firm also sent a perennial Sunflower called Helianthus mollis, which had been raised from Texan seeds. With reference to this it was remarked that little of importance need be expected from seeds from Texas, whose plants are to a great extent mere Composites, perfectly unworthy of the trouble of raising. Mr. Rosher, of Hamilton Terrace, St. John's Wood, sent a small Barkeria spectabilis, and a very nicely-flowered Rhododendron javanicum, for which a Certificate of Merit was awarded. Mr. Rivers showed an Atlas Cedar in a pot with perforated sides, which when sunk in the earth permit the roots to pass into the surrounding soil. This has the effect of keeping the roots from wandering too far "from home," and altogether prevents them from taking that corkscrew shape which is one objection to growing such plants long in a common garden pot. It was stated, however, that the contrivance is not new, and that for private purposes at least it is inferior to planting the young trees in old worn-out baskets, and sinking the latter in the soil till such time as it is convenient to plant the trees where they are to stand. Mr. Ingram exhibited, from the Royal Gardens, Frogmore, a stalk of Holcus saccharatus, a supposed substitute for sugar cane, and also grown in India for its grain. It was evident that it would certainly not pay to cultivate it here for what sugar it might yield. Attention was then directed to fine specimens of the Bamboo grown in Devonshire, by John Luscombe, Esq., of Combe Royal; where the climate will produce specimens like those, as is the case in Mr. Smith Barry's ground, near Cork, the Bamboo becomes invaluable, as giving a varied and tropical appearance to our northern landscape.

Of Fruit there was a considerable quantity. Mr. Fleming gr. to the Duke of Sutherland, at Trentham, received a silver Knightian medal for two handsome Pine Apples of the Montserrat kind. One weighed 5 lbs. 1 oz., the other 4 lbs. 1 oz. Mr. James, gr. at Ponty Pool Park, had three Pines, for which a Banksian Medal was awarded. One was a smooth-leaved Cayenne weighing 4 lbs. 12 oz., the others were Queens, the heaviest 4 lbs., and the lightest 3 lbs. 11 oz. Mr. Ogle, gr. to the Earl of Abergavenny sent an Enville weighing 6 lbs. 1 oz., for which a certificate was awarded, and another Pine of the same variety weighing 5 lbs., came from Mr. Elms, gr., Winsdale House, Exeter. Mr. Forbes, of Woburn, contributed beautiful bunches of Black Hamburgh Grapes, finely coloured, and covered with bloom, which had not been rubbed in the least by travelling. A Banksian Medal was awarded them. From Mr. Webb, gr. to Sir Jasper Atkinson, came a bunch of Black Barbarossa Grapes weighing 2 lbs. 8 oz. This, as we have often remarked, is one of the very latest keeping Grapes we have, West's St. Peter's not excepted. A Certificate of Merit was awarded it. Mr. Muirhead, gr. to Lord Charles Wellesley, received a similar award for two well-coloured bunches of Black Hamburgh, weighing respectively 1 lb. 13 ozs., and 1 lb. 14 ozs. These were stated to have been cut from Vines that had suffered from mildew which had been kept down by continual perseverance in the use of remedial measures, among the most effective of which, was named M'Adam's anti-blight composition. The bunches shown certainly had no traces of the disease about them, and though rubbed were altogether good specimens of careful Grape growing.

Of Pears Mr. Ingram furnished some magnificent fruit from the Royal Gardens at Frogmore. They were equally large and handsome as the best specimens imported from France. The sorts consisted of Van Mons-Léon le Clerc, Vicar of Winkfield, Beurré Diel, Beurré Bosc, Napoleon, Passe Colmar, Colmar d'Aremberg, Eyewood, Winter Nelis, Fondante d'Automne, and a new kind called Ananas. These received, as they well deserved, a silver Knightian Medal. The next best collection came from Mr. Tillyard, gr. to the Rt. Honble. the Speaker, at Heckfield. It contained Seckel, Grosse Calebasse (not a first-rate pear), Duchesse d'Angoulême, Brown Beurré, Marie Louise, and the Forelle or Trout Pear. A Banksian Medal was awarded. A third set, to which a Certificate of Merit was awarded, came from Vincent Fenn, Esq., of Canterbury, and consisted of Passe Colmar, Marie Louise, Duchesse d'Angoulême, Winter Nelis, Hacon's Incomparable, Beurré Diel, Glout Morceau, Beurré de Capiaumont, Crassane, and Beurré Rance. Mr. Chapman, gr. to the Earl of Gainsborough, also had a collection of Pears—good fruit, but too much out of condition, from having been kept in London some time. They consisted of Marie Louise, Hacon's Incomparable, Louise Bonne (of Jersey), Brown Beurré, and Autumn Colmar.

From Mr. Rivers came a dish of the Louise Bonne (of Jersey) Pear, remarkable for fine flavour and high colour, qualities considered by Mr. Rivers to have been given them by the Quince stocks on which they had been grown.

Mr. Hill, gr. to R. Sneyd, Esq., received a Certificate of Merit for a dish of beautiful fruit of Coe's Golden Drop Plum, still in a state of excellent preservation. Mr. Ingram showed a punnet of well-coloured Prince of Wales Strawberries, from plants which had been forced in spring, and which are now bearing a good second crop. It was stated that ripe Strawberries have been gathered from these plants for nine weeks past, and that they will continue to yield fruit yet for some time to come.

Of Vegetables, Mr. Ingram sent a dish of Mohawk Kidney Beans, which had been grown in a pit without fire-heat. Mr. Lidgard, of Hammersmith, had three good dwarf compact heads of Céleri Turc, for which a Certificate of Merit was awarded. From H. Hollist, Esq., of Lodsworth, near Petworth, came very fine specimens of Potatoes, which seemed to be perfectly free from disease. They were sent to show what sorts are chiefly cultivated in Sussex, and with what success. The following is Mr. Hollist's list of them:—

No.	Name.	
1	Jersey Blue	Well-known.
2	Pink Kidney	I have more than doubled the size of this tuber within the last few years—it is a valuable variety.
3	London Kidney	Very good; originally sent to me by the Horticultural Society.
4	Fox's Seedling	Very good.
5	Early Champion	A fine Potato in a dry soil.
6	Cups	Second year of cultivation; a promising variety.
7	Julys	One of the best stock Potatoes grown, and a most abundant bearer.
8	Never-blight	This variety has withstood the blight better than any grown in this neighbourhood; it is an universal favourite, particularly with the poor.
9	Farmer's Glory	A highly prized variety.
10	York Regent	Well-known.
11	Winchester Pink	An abundant bearer; better suited to the farm-yard than the table.
12	Forty-fold	An excellent and prolific variety.
13	Downton Yam	From tubers sent me by the Horticultural Society, 20 years ago.
14	Canada Pine	A useful variety, little affected by the blight; I introduced it into this neighbourhood nearly 30 years ago.
15	Guildford yellow	A good variety, but apparently fond of chalk soils.
16	Ash-Leaf Kidney	Well-known, but seldom grown pure; excellent when it does not sport.
17	Goldfinder	Brought from South America, and worth the voyage.
18	Early Manly	Very good.
19	An Early Seedling	of great promise; farina very pure; a good keeping variety.
20	A Seedling from Belgium; also of good promise.	

As a preventive of disease, Mr. Hollist stated that he had found wood ashes, charcoal, or any dry material of that sort, more effectual than any other substance.

Finally, Heckfield furnished examples of the half

transparent fleshy carrot-shaped roots of Oxalis Deppei, of which an account was published in the Society's Transactions many years ago. Such roots have hitherto been used only as an esculent; but Mr. Tillyard suggests, that as they take sugar well, they might be found to make a good preserve.

Of miscellaneous articles Mr. Dodds, gr. to Col. Baker of Salisbury, sent a model straw-sash, which he uses as protection in winter for Pine pits and other purposes. It consisted of a skeleton wooden frame thatched over with straw, tied firmly down on the bars of the frame by tarred twine. It was stated that protections of this kind were speedily made, cheap, effective, and durable, and that they could easily be converted into capital coverings for bedding-out and other plants requiring shelter from night frost.

From the Society's Garden came a collection of Pompone Chrysanthemums, and the following plants—Begonia Thwaitesi, and the Pilea, described in our report on the Garden at p. 711, Linum trigynum, Epiphyllum truncatum, Echeveria retusa, and the brilliant ever-flowering Tropæolum Triomphe de Gand.

Pomological, *Nov.* 6.—This new Society had an exhibition of fruit on this occasion, consisting chiefly of Pears and Apples, of which there were said to be about 2000 specimens. There were also a dish of Grapes and some Peaches. Specimens of a yellow Peach called the Apricot Peach, raised from a stone brought from Italy, in 1844, by Colonel Salway, attracted much attention. The sort from which it was raised is said to ripen in Italy the middle of October. The specimens exhibited were gathered from the seedling tree on a wall in Col. Salway's garden on the 3d inst.; the flesh parted freely from the stone, and is of a deep orange colour, juicy, and of an agreeable sweetness, with scarcely any of the prussic acid flavour so often prevalent in late Peaches. Their smell was like that of a ripe Apricot, and very powerful. This Peach will doubtless prove a valuable acquisition if its flavour is always equal to that of the specimens exhibited. It was stated by Mr. Powell, of the Frogmore Gardens, that it was equally good last autumn, although the season was, as is well known, very cool and moist. Some specimens of a new late yellow Pavie or Clingstone Peach from Bordeaux, called Pavie Genisaut, exhibited by Mr. Rivers, ripened in a house with gentle heat, were found to be dry and worthless. "Mountain" Peaches from Holland, exhibited by Messrs. Webber, of Covent Garden, and said by them to have been sent to them *viâ* Hamburgh nearly a month ago, were too far gone to judge of their quality; they were freestones, and Mr. Webber said that both last year and this they had found them of great excellence, far exceeding the Catharine Peach in goodness, and coming in about the same time. Messrs. Webber likewise exhibited some fine Chaumontel and other Pears from Jersey. Among the Pears by far too numerous to particularise in this report, were some from G. Unthank, Esq., of Limerick; these seemed to show that the soft, humid climate of Ireland, more particularly that of the south, is as favourable as that of Jersey for the cultivation of Pears. In Mr. Unthank's collection were a Beurré Rance, weighing 18 oz., Duchesse d'Angoulême, 17 oz., Old Colmar, 10 oz., Beurré Diel, 14 oz., Josephine de Malines, 7 oz., Susette de Bavay, 8 oz., and Easter Beurré, 13 oz. Fine specimens of Beurré Clairgeau were exhibited from the garden of W. Wells, Esq., of Redleaf. As this new Pear is quite a "lion" in Belgium and France, and has been much talked off in this country, considerable interest was created in testing and tasting their quality—they were quite fit for the table, large and very beautiful, no Pear, perhaps, equal to them in that respect, being on the sunny side of a fine clear pink, tinted with russet near the stalk, and in shape something like a large Beurré Bosc; their flesh was found to be tender and juicy, not buttery, and their flavour flat and watery, entitling it to be classed only as a second-rate variety; these specimens were gathered from a tree on a south-east wall; one specimen from a pyramid on a Quince, from M. Langelier, of Jersey, was a shade better, but far, very far inferior to the Marie Louise. Some fine specimens of the new Pear Beurré Nantais, not ripe, were sent with the Beurré Clairgeau from the garden of Mr. Wells; these were large, of a deep russet, and looked as if they would turn out well. A beautiful sort of Quince from Syria was exhibited by Messrs. Veitch; the specimens were as large as the Portugal Quince, not long, but more of the shape of the Crassane Pear, and very smooth and regular, without any of the rugosities peculiar to the Quince. Their flavour was found to be but middling—the Quince flavour scarcely apparent. A very interesting collection of Pears was sent from Yorkshire, from — Fox, Esq.; the specimens were fine, and the nomenclature very correct. A seedling Pear from the old autumn Bergamot was shown by Mr. Rivers; the specimens were larger than the parent variety, of the same shape, colour, and flavour, but too deficient in juice; this sort was brought principally with a view to show the hardiness of Pears raised from seed in England. The frost of last April was reported to have destroyed all the blossom of the Pears growing near this seedling, even such hardy sorts as the Hessel, Williams' Bon Chrétien, and Beurré Capiaumont, and yet every blossom of this seedling Bergamot set its fruit. M. Langelier had a large collection of Pears from Jersey. The finest flavoured Pears tasted in the course of the day, out of some hundreds, were Beurré Superfin (this generally ripens in September), Fondante d'Automne, Thompson's, and Eyewood; the latter had a most perceptible touch of the Pine-apple flavour. Of Apples, there were some beautiful specimens of Ribstons, King of the Pippins, and other well-known kinds.

New Plants.

99. Sonerila margaritacea.

S. margaritacea: caule ramoso petiolisque glanduloso-tomentosis, foliis oppositis æqualibus obovato-lanceolatis subserratis penniveniis basi obtusis æqualibus subtus glabris supra pilo brevi e medio omnis maculæ albæ ascendente, floribus triandris, antheris subulatis monoporis, calyce elongato lævi, coronulâ cyathiformi denticulatâ, stigmate punctiformi.

For this most beautiful novelty we are indebted to Messrs. Veitch, who obtained it from some part of India, through Mr. Thomas Lobb. It forms a compact branching brittle tuft from 9 to 12 inches high, conspicuous for its polished crimson stems, deep rich green leaves closely marked with white oval spots, and a profusion of bright rose-coloured flowers resting upon crimson stalks. A specimen was exhibited on the 7th inst., at the Horticultural Society's meeting, and excited the admiration of everybody present. No doubt it will be a stove plant of the easiest cultivation; and among the variegated races, now becoming so much the fashion, it stands without a superior. The little oval white spots upon the leaves suggest the idea of the foliage being sown with pearls.

We can find no trace of the species in books. It seems to approach *S. secunda*, of Wallich, but is very different in the form of its leaves, which in outline and veining resemble those of *S. picta*; and in outline, but not in veining, may be compared to *S. grandiflora*, the structure of whose coronet is quite dissimilar, a part of the organisation of these plants which has not received the attention it seems to deserve.

100. Thuiopsis borealis.

"Can you give me any information respecting Thuiopsis borealis advertised in your columns as a beautiful new hardy Conifer? I have received from Mr. Pontey a specimen (which I enclose) and which is certainly different from anything I have yet seen among Conifers. Mr. Pontey does not say what is its native habitat, nor what is his authority for the name." *J. B., Biddulph Grange.*

A plant under this name was exhibited in 1852, by Messrs. Thibaut and Kételeer at one of the horticultural meetings in Paris; and it was then reported to come from the mountains in the north of India, a strange statement coupled with the word *borealis*. In 1853 it was again shown in Paris, by a M. Rémont, and it occurs in the list of Conifers cultivated in the "Jardin des Plantes." Beyond this we have not traced it. The specimen sent belongs to some plant unknown to us, unless it is the young state of some Coniferous plant hitherto seen by botanists only in the adult condition.

FLORICULTURE.

Planting the Ranunculus.—I plant my Turbans during the present month; but in general I keep the other sorts out of the ground till the beginning of February. This allows me to expose the soil of my bed as much as possible to the action of frost, and a few fine dry days in spring enable me to commit my tubers to the earth in safety. As to time a few days earlier or later in planting will not be of much importance, provided the soil is sufficiently dry to allow of its filling up the interstices of the tubers, and securing that firm yet porous state so necessary for a healthy vegetation. The day being dry and fine, you may at once commence your operations by nicely levelling the bed, which should be perfectly flat, and not raised in the centre, a practice of which inexperienced persons are so fond, and which is so often injurious. As the Ranunculus naturally requires a low marshy soil, it will demand, in its cultivated state, a great deal of moisture, and therefore the bed should be below the level of the garden rather than above it, that drought may be repelled as long as possible, and that artificial watering, when necessary, may be most effective. In levelling, let the surface only be stirred, as some degree of firmness in the subsoil is advantageous to the plant. Have ready the roots in the papers with the names, some neat wooden labels, and a quantity of clean white sand; then, determining to brave the cold wind which may be blowing, and not to be discouraged by the back-ache, proceed to commit to the earth the humble looking tubers, which in four months are to develop so many beauties. About 4 inches apart every way is probably the best distance at which the Ranunculus should be planted, and the amateur should therefore regulate the size of his bed by the number of roots in his collection, and dispose them equally all over it. With a cord and a small trowel draw a straight furrow across the bed, beginning in the centre and advancing to the edge with successive furrows, that the planted roots may not be interfered with. Place the roots so that the crowns shall be one inch and a half beneath the surface when the bed is completed, and having thus filled the furrow with tubers four inches apart, drop a little sand on each, sufficient to cover it, and draw the excavated soil over the whole. Make another furrow four inches distant from the first, and proceed as before until that side of the bed is finished. Then operate in the same way with the other side, and the work is done. A slight pressure with the hand should be given to every row as the work proceeds. With regard to the labelling, I have found the following plan the best:—As each root is taken out of the paper, write its name on the painted stick with a strong lead pencil, and place root and label in the furrow together. The stick should be about one inch distant from the root, and must be fixed in rather firmly, as I have found the nocturnal perambulations or gambols of a cat sufficient to throw them into confusion. If the writing is always turned the same way, either towards or from the root, all ambiguity or mistake will be avoided. Although the genial days we sometimes have in February allow the operations of sowing and planting to be carried on with advantage, it often happens that severe and continued frosts set in after the Ranunculus bed is completed, and the hopes of the florist are committed to it. This probable evil must be guarded against; for although the root will sustain a hard frost when it is really rooted, it is very sensitive when that is not the case. If a frost should come, a mat laid upon the bed will avert injurious consequences, or two may be used if the weather is severe. If, in the day time, the sun has power to unbind the soil, the mats may be taken off, and the warm rays admitted; but be sure the mats are replaced at night. If the weather is auspicious, about three weeks will be sufficient for bringing the young shoots to the surface, when further care as to cold will be unnecessary. An operation must then be attended to of the utmost importance both to the future bloom and the increase of the tuber. When the leaves are about half an inch above the ground, the soil must be firmly pressed round them, so as to fix the tuber firm in the ground. This may be done twice with advantage as the growth proceeds. Lightness of the soil has been very often fatal to the Ranunculus, and must therefore be guarded against in the manner just described. The operations which have been mentioned in this paper are rather laborious, from the long continuance of the stooping posture, and they will probably discourage those who are not thoroughly imbued with a love of flowers. But the resolute amateur will remember that no good results are ever secured without toil, and he will be cheered in his labours by the brilliant prospect before him. *S.*

Carnations: *D.* Examine these and Picotees in pots. Should any plants unfortunately suffer from mildew, remove them instantly from the collection to a frame by themselves; cut away the affected part, and dust the plants with sulphur.

Hollyhocks: *P.* These should now be cleared of all decayed and superfluous foliage, and the soil round each plant forked, and a coating of burnt clay ashes put round and between the shoots; this is a great preventive of the attacks of slugs, which, during mild autumnal weather, feed greedily on them. Examine all rooted cuttings, for these are very apt to rot off during winter; keep them rather dry than otherwise, and give abundance of air to the frames.

Polyanthus: *E S.* You should enquire for Addis's Kingfisher, a bold, finely formed, and rich red kind. We should be glad to see flowers of this style more patronised, as they contrast so well with the darker varieties.

Tulips: *Jane.* These should be planted immediately should the weather continue dry: by all means avoid wet; it will be better to defer the operation a few days in such a case.

Miscellaneous.

The Fig (Ficus carica), is a native of the south of Europe, including Greece and Italy, of Northern Africa, and of Western Asia. The wild type known in Italy by the name of Caprifico, has indeed been distinguished by Gasparini not only as a species but as a separate genus, yet we cannot but concur with Professor Targioni in the opinion, confirmed by positive assertion on the part of practical pomologists both ancient and modern, that our garden Figs are of the same species, and have repeatedly been raised from seeds of the wild Caprifico. We find mention of the cultivation of Figs, and of the high estimation in which these fruits were held, in the very earliest writings, in the Holy Scriptures as in Homer's Iliad. Those of Athens were celebrated for their exquisite flavour. Xerxes was tempted by them to undertake the conquest of Attica, in the same way that Cato urged the Romans to that of Carthage, a Fig in his hand. The number of varieties, however, produced in ancient Italy were not numerous. Six only were known in the time of Cato. Others were afterwards introduced from Negroponte and Scio, according to Pliny, who gives a catalogue of 30 sorts. Their names are mostly taken from the countries whence they had been brought, such as the African, the Rhodiote, the Alexandrine, the Saguntine, &c., or from some great personage who had introduced or patronised them, such as the Pompeian from the great Pompey, the Livian from Livia, the wife of Augustus, &c. Macrobius, two centuries after Pliny, enumerates 25, but generally under names different from those of Pliny. Gallesio, in his Pomona Italiana, has referred a few of those ancient names to modern Italian varieties as for instance:—The Albicerata to the white Fig of the Italians. The Tiburtina to the gentile. The Africana to the Brogiotto nero, which some believe to be also the Emonio of Athenæus. The Liviana to the pissalutto. The Lydia to the fico trojano, very abundant at Naples. The Carica to the dottato, common in the Levant, and originally from Cauni in Caria, from whence so many were sent to Greece and called on that account Cauni Figs and Carica. In Tuscany, the varieties of Figs cultivated are numerous, many of them due to the days of the Republic. Fra Agostino del Riccio, in his already-quoted manuscripts, gives a selection of 31 sorts cultivated in Tuscany in the middle of the 16th century, adding that there were many others which he had not included, not having seen them himself. Those of the Medici gardens represented in the drawings of Castello comprise 18 early

and 32 late sorts, in all 50 ; and Micheli in his manuscripts carries the number up to 95. Notwithstanding the softness of the wood, and the readiness with which the branches are killed down, the trunk of the Fig tree is remarkable for its longevity. Pliny tells us of an aged wild Fig in the forum, which was in a dying state in his days, but which they dared not cut down on account of the tradition that under its shade the wolf had suckled Romulus and Remus ; that another wild Fig in the forum had arisen over the chasm into which Curtius had precipitated himself, and was preserved in memory of that feat: and that a third similar tree, which dated from before the time of Saturn, was cut down in the year of Rome 260 to erect the building where the vestals were placed. These tales may indeed not be true in their details, but the trees they relate to must have been known to have been several centuries old. *Journal of the Horticultural Society.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Use no more fire heat here at present than may be indispensable for securing a gentle circulation in the atmosphere, and avoiding damp, and very little will suffice for this, and also for maintaining a sufficient degree of warmth for most plants that may be in bloom. Give air moderately on every favourable opportunity, avoiding cold currents, especially against plants that may have been brought from the stove, or such as have been in heat to forward their blooming. Aim at securing a regular display of flower throughout the winter, by bringing on the stock of plants at command so that there may be about an equal quantity for service at all times. It requires some experience to manage this nicely, and young gardeners should carefully observe the length of time that the various plants remain in beauty, and also how long it requires in a given temperature to bring them into flower. It is true that there are various circumstances, such as the state of the plant when placed in heat, and the season of the year at which it is attempted to force it, to be taken into account in forming such an estimate ; but careful observation, extended over a few seasons, will enable one to form a very correct opinion, both as to when plants will be wanted in bloom to maintain a regular display, and also how to treat them so as to have them exactly when wanted. But this must be learnt by experience and careful observation, for it cannot be communicated by any directions, however minute. We would, however, advise that the largest stock of which the convenience will allow should be prepared; for a small surplus in the way of bloom is no fault at any time, and a proportionately large stock for the demand is the best safeguard against a scarcity. Give the most diligent attention to maintaining order and neatness, and to keeping the plants and everything about the house perfectly clean.

FORCING DEPARTMENT.

Pineries.—Plants swelling their fruit, and those in bloom should be assisted by a rather warm temperature, but excess of moisture in the atmosphere must be avoided at this dull season, particularly where the plants are in bloom, or the fruit approaching maturity. Use strong clear manure-water in a tepid state for plants swelling fruit, but do not get the soil too wet. The temperature for the growing stock should now be regulated very much by circumstances ; keeping them growing gently where it can be done without drawing or weakening the foliage. Keep the soil about the roots in as equable a state as to moisture as possible, for letting the soil get too dry at this season often results in the plants showing fruit prematurely in spring, and the same is true with regard to the bottom-heat, which must also be carefully attended to, keeping it moderate but as regular as can possibly be done. Vineries.—Where forcing is commenced about this time a rather higher and moister temperature will be necessary to induce the buds to start than would be the case at a more natural season. There is no better means of securing abundance of moisture and a gentle warmth than by placing a moderate quantity of stable manure on the inside border, and turning this, &c., as may be required ; but where the forcing houses are visited by the family, and expected to be neat and orderly, this method is out of the question, and the syringe and whatever other means of a less objectionable character may be at command, must be used instead. The night temperature, to begin with, should range about 50° by fire heat, raising it to 60° by day, or to 70° with the assistance of the sun. Also endeavour to secure a little warmth for the roots in the outside border, and if fermenting materials are used, watch these narrowly, and endeavour by timely additions and frequent turnings, to secure a regular gentle warmth of 60° or 65°, at a foot below the surface of the soil. And if fermenting materials are used, there will be a great saving of labour, &c., by thatching these with a good coat of something to throw off wet, and preserve them from the weather. If plants in pots or boxes are used for forcing at this season, they should be placed in a mild bottom-heat, so as to excite a healthy root action, which will cause them to break more freely and in less time than can be done without bottom-heat. Ripe fruit will require the most careful attention during this dull damp weather, and the bunches should be frequently examined, removing every decaying berry, so as to prevent the mischief spreading to the others. Peaches.—If forcing has to be commenced early, no time should be lost in getting the house thoroughly cleaned, the trees dressed and tied, &c., so as to have everything in readiness for starting ; also lighten up the surface of the inside border, and apply whatever manure or top-dressing may be deemed necessary, and cover the outside border so as to keep out the wet, and preserve it from the weather.

FLOWER GARDEN AND SHRUBBERIES.

The few flowers that may remain on the bedding out plants in even the most favoured localities are not worth preserving any longer, and the beds should be cleared at once so as to allow of getting them nicely trimmed up for the winter. Where the extent of ground occupied by "bedding out plants" in summer is considerable, it is not always convenient to find spring-flowering bulbs to plant the whole of it with, and where this is the case, very much may be done towards producing a cheerful effect by a judicious use of small evergreens of a formal or neat habit of growth. These can be prepared in the reserve garden, to which they must of course be removed every summer, and as they have to be shifted twice every season they require no particular trouble to remove them with perfect safety ; and beyond the labour of moving them to and from the flower-garden, and a few waterings after their spring shift, they involve but little labour or expense. For this purpose we prefer those that are perfectly hardy, and of a formal habit of growth, or can be readily cut into any desired form, such for instance as Arbor-vitæ, Cypresses, Junipers, Yews, Tree Box, &c , and Laurustinus and the old Mezereon, and some other Daphnes for their flowers. The winter-flowering Heaths are also very suitable, as are many other plants which might be mentioned; but we have indicated the kind of selection which we think the best adapted for the purpose. We do not, however, mean to recommend planting the beds closely in winter with such things, for this would require a very heavy stock, and involve a serious amount of labour, and all would produce no very striking result. These should be planted so as to mark in the most distinct manner the outline of the garden and principal figures. The beds can be much more cheaply planted, and to better purpose, with such things as the early-blooming Phloxes, Anemones, Tulips, Crocuses, Snowdrops, Scillas, Gentians, and many other spring-blooming plants, which are familiar enough to every gardener. These involve no expense, after a sufficient stock of them has been obtained, beyond the labour necessary to remove them to and from the flower-garden, and to keep the ground clean in summer about such of them as require a place in the reserve garden; and with a good stock of these, and a judicious use of a moderate quantity of small formal evergreens, very much might be done to improve the ordinary winter and spring appearance of the flower-garden.

HARDY FRUIT AND KITCHEN GARDEN.

The Strawberries in pots should now be placed in their winter quarters. The common practice of stacking up the pots on their sides in sloping ridges is somewhat troublesome, and quite unnecessary for the protection of the plants. If the pots are placed in lines, at a proper distance apart to allow sufficient space for the foliage, and the spaces between the pots filled with coal ashes or dry fern, placing a slight covering of the latter, or clean straw, upon the surface of the pots under the leaves, the plants will winter equally well or better than in ridges, and will present a neater appearance without involving half the labour. Care should be observed, however, to place the pots upon a thoroughly drained surface, for frost is comparatively harmless in the absence of moisture ; therefore a few inches of coal ashes or lime rubbish should be placed under the pots. The best situation, however, for the portion of the plants intended for forcing first, is a spare cold frame, or near the glass in a cool Peach-house, as they will be safer here than under any system of protection out of doors, and as their roots will be preserved in an active state, very little forcing will be necessary to excite them at the proper time. The fruit stores will still require careful attention, and the fruit must be frequently looked over, removing any that are found to be tainted with decay. Many of the best autumn Pears will now be getting ripe, and it will add greatly to the interest of the fruit room if a portion of each of the sorts fit for use can be placed in a conspicuous situation, and correctly named. The late keeping kinds of Pears and Apples should be stored in a place by themselves, where they can be kept cool, and excluded as much as possible from the light and air, for these are apt to lose their briskness, and become very much shrivelled when kept in the ordinary fruit room. Let Cauliflower or Broccoli coming into use be removed to where it can be protected from frost ; also attend to protecting Lettuce and Endive, and guard against slugs among the young Lettuce and Cauliflower plants. Get manure wheeled upon vacant ground on dry days or frosty mornings, and proceed with trenching, so as to expose the soil to the influence of the weather.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Nov. 9, 1854, as observed at the Horticultural Gardens.

Satur. 18	48.4	34.2	41.3	17	0.56	2	4	1	2	3	10	3	3

The highest temperature during the above period occurred on the 12th 1841—therm. 63 deg.; and the lowest on the 16th, 1841—therm. 15 deg.

Notices to Correspondents.

Apricots: *Halesleigh.* For a north-west aspect you may try the Breda Apricot; it may ripen sufficiently well for preserving. On the same aspect you may plant the Jefferson Plum, or the Louise Bonne (of Jersey) Pear.

Battersea Park: *X.* We do not know who will have the trees and shrubs to purchase for this park, or to what address offers of them should be sent; but we imagine the proper officer to be Sir Wm. Molesworth.

Espaliers: *Old Sub.* We regret to say there are so many words in your note which we are unable to decipher, that we have failed in determining the exact meaning of your enquiry.

Grapes: *Tyro.* The Cannon Hall Muscat is a strong enough grower on its own root. As the locality is wet, you ought to manage so that no water can reach the soil except that which falls on the top of the border, the admission of which you can regulate. With regard to your second question, you may as well make the border the full width at once; afterwards you can turn it over in advance of the extending roots.—*A Subscriber.* The White Muscat of Lunel is the same as the White Muscat of Alexandria.—*M R.* The Raisin de Calabre Grape has a large bunch, with round, white, transparent berries, and will hang on the Vine nearly as long as Oldaker's St. Peter's. On this account a plant of it may be introduced in a late house, although its flavour is not so rich as that of the Muscat Grapes.

Gynerium: *A H.* We are unable to answer the question; but we should not anticipate any success in such an experiment, even if anybody possessed both sexes. The plant in the Garden of the Horticultural Society is a female.

House Bugs: *A Sub.* Nothing is easier than to destroy them if you follow these directions. Empty the place of everything moveable. Scrape off all paper or other loose material, and throw it as the work proceeds into a brazier of live charcoal. Then fill in all the cracks in plaster with a mixture of corrosive sublimate and plaster of Paris. Also prepare a sufficient quantity of soft soap well mixed with corrosive sublimate, and with it fill, with a putty knife, all cracks in woodwork, and every crevice in the floor. Burn old carpets, &c. As to the furniture, fill every joint, or crack, in which it is possible for bugs to harbour, with the same mixture of corrosive sublimate and soft soap. By this means, if the work is thoroughly well done, and by no other means, you may clear any house of these vermin.

Insects: *H Le K.* The insects enclosed with your note are the perfect beetles and larvæ of the common weevil, Otiorhynchus sulcatus, described and figured in *Gard. Chron.*, 1841, p. 292. The most advisable plan for arresting the ravages of the larvæ is to repot the plants, employing earth which has been carefully sifted, as well as sifting that removed from the pots, so as to collect the larvæ, which must be destroyed. The roots of the Auriculas must also be carefully shaken. The perfect insects, from their dark colour and nocturnal habits are very difficult to be captured. *J O W.*

Names of Fruits: *B. Heathfield.* The Gilogil, a baking Pear. —*Alsned.* The French Russet.—*J. Clarren.* Beurré de Capiaumont.—*Thirsk.* 3, Beurré d'Angleterre; 7, Princesse d'Orange; 12, Marie Louise; 14, Glout Morceau; 25, Messire Jean; 26, Louise Bonne (of Jersey); 31, Catillac.—*Oakham.* 1, Hollandbury; 2, Lamb Abbey Pearmain; 3, Cockle Pippin? 5, King of the Pippins; 6, Downton Nonpareil; 1, a bad Pear, unknown; 3, Glout Morceau; 4, Forelle; 5, Knight's Monarch.—*E J K.* The Black Morocco.—*E B.* 1, Ormskirk Bergamot; 2, Swan's Egg; 3, Ambrosia; 4, Brown Beurré.—*R F.* 1, Uvedale's St. Germain, weight 1 lb. 15 oz.; 2, Duchesse d'Angoulême; 3, Chaumontel; 4, Catillac; 5, Glout Morceau; 6, Black Worcester; 7, Beurré Diel; 8, Swan's Egg.—*H G.* 1, Crimson Queening; 2, Rymer; 3, Kirke's Lord Nelson; 4, King of the Pippins; 5, Franc Real d'Hiver; 6, La Fortunée de Parmentier; 7, Seckel; 8, Rousselet de Rheims.—*F.* 1, 2, Beurré de Capiaumont; 4, Aston Town; 5, Althorp Crassane.—*A C.* 1, Northern Greening; 3, Court-penda Plat; 4, Gloria Mundi; 5, 8, King of the Pippins; 6, Reinette du Canada; 7, Court-penda Plat; 9, Early Nonpareil; 10, Beachamwell; 11, King of the Pippins; 12, Hacon's Incomparable. Two Pears with the numbers detached; one is decayed, the other obovate, with an open eye, short stalk, colour reddish russet, is the Beurré de Capiaumont.—*J S Essex.* 6, Duchesse d'Angoulême; 7, Bon Chrétien Fondante; 8, Beurré Diel; 10, Beurré Bosc; 16, Urbaniste; 18, Passe Colmar; 24, Easter Beurré.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Mr. Woolley.* Cattleya maxima.—*M. Oxford.* The parasite on Limnocharis Humboldti is Oidium leuconium, the conidiiferous state of some Erysiphe, of what species it is impossible to say, till the sporangia are detected, and these probably will not be perfected in such a situation. *M J B.*—*A M.* The tree which you say is grown in Italy for feeding horses is Ceratonia siliqua, the Carob tree, or St. John's Bread.

Native Oaks: *B W.* We believe Mr. Billington to be perfectly right, and will repeat our reasons for the opinion at an early opportunity. In this matter prejudice has fairly beaten experience.

Peach Trees: *J M M.* They are badly affected with Soot Fungus, for which we know of no certain cure. We would advise you to remove the leaves, which can now be of no further use, and try the effect of washing the trees well with lime water.

Plum: *A H.* The Reine Claude Violette is a good bearer; and its quality is excellent.

Tulip Trees: *Diss.* It is not usual to prune these trees. When old they flower abundantly without care. Pruning is more likely to retard than accelerate their blossoming. If for any reason unexplained you must prune, then do so in mid-winter.

Wells: *A Correspondent* would be much obliged to any reader of the *Gardeners' Chronicle* who would favour us with a drawing, for publication, "of the simple and cheaply constructed wells, which are seen by the side of railways through France, in the least possible farms, as well as in Italy."

Misc.: *W E B.* Your question is not horticultural.

THE
PATENT LIQUID MANURE EXPERIMENT AT READING.

MESSRS. SUTTON AND SONS would advise their Agricultural and Horticultural Friends to inspect Mr. WILKINS' experimental Garden in the Caversham Road, Reading, *before the roots are taken up*, and will be happy to give cards of admission on application at their Seed Shop, Market Place, Reading, Berks.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6*l.* per ton, free to Railway.

They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.

Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CABNE, 10, Mark Lane, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

SAMUELSON'S PATENT PRIZE FORKING MACHINE (Silver Medal from the Royal Agricultural Society of England, Prize from the Yorkshire Agricultural Society, Prize from the Cleveland Agricultural Society, and Prize from the Worcestershire Agricultural Society) is now proved by experience to be an invaluable implement for deep tillage, and equally effective as an extractor of Couch Grass and other Weeds, in testimony of which, numerous reports from farmers using it in every part of the kingdom may be had on application. Various imitations have failed, through the absence of its essential feature—the Patent Fork. The amount of horse power is less in proportion to the surface deeply pulverised than that required in the ordinary shallow ploughing. The application of steam power to tillage is still a problem to be solved, and it is not necessary to defer deep cultivation until its solution be accomplished.

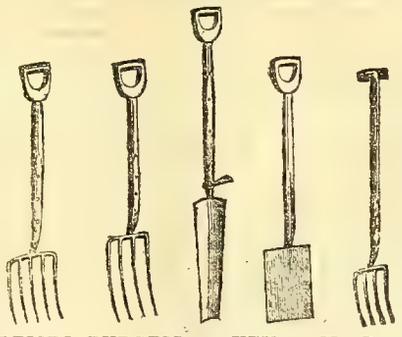
SAMUELSON'S IMPROVED GARDNERS' TURNIP CUTTER (Prize for the ninth time, at the Royal Agricultural Society's Meeting, Lincoln, 1854). The improvement is a rasping plate for loosening and voiding dirt from the roots, whilst being cut, whereby the scouring tendency of root feeding is diminished.

B. SAMUELSON (Successor to late Mr. Gardner), Britannia Works, Banbury.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

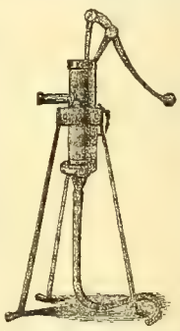
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.



The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel,	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2¼ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

GRANITE.—ENTRANCE GATE PILLARS, COPINGS, and every kind of Yard and Stable Pitching; Field and Garden Rollers, Stack Pillars and Caps, Cattle Troughs, Window Sills, and at prices reduced by railway carriage.

Apply to H. SWIFT, Brent Moor, Ivy Bridge, South Devon.

Specimens to be seen at the Wharf, Globe Bridge, Globe Road, Mile End, London.

Monuments according to design and estimate.—Agents wanted.

AGRICULTURAL TUITION.—Sons of Gentlemen received as Agricultural Pupils into the family of a Clergyman occupying a Farm, cultivated under the Improved System, 25 miles from London.—Address Rev. C. C., Office of this Paper.

CHEMISTRY.—A Gentleman, who has had great experience in Practical Chemistry, will give private instruction in Chemical Analysis, especially in its application to Agriculture and the ARTS.—CHEMICUS, care of Mr. Stanford, 6, Charing Cross.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

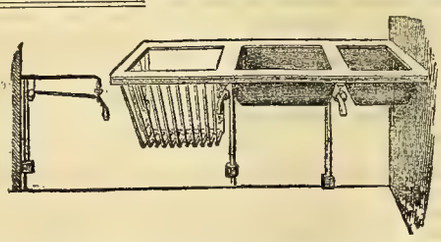
THE SALISBURY AND WESTERN COUNTIES EXHIBITION OF DOMESTIC POULTRY.—The Fourth ANNUAL EXHIBITION will be held on TUESDAY and WEDNESDAY, the 21st and 22d days of November, 1854. Prize Lists, with the Rules and Regulations, can be obtained of the Hon. Secretary, and Subscriptions will be received by Mr. EWER, the Treasurer. T. PAIN, HON. SEC.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.

COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest. The

ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.



Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at their

Works, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

The Agricultural Gazette.

SATURDAY, NOVEMBER 11, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, Nov. 16—Agricultural Imp. Society of Ireland.

THE chair of Agriculture in the University of Edinburgh has been recently vacated by the resignation of Professor Low, and filled by the subsequent appointment of Professor WILSON. It has been occupied by the former gentleman for a period of nearly a quarter of a century, during which time, by his lectures and his published works, he has done all that a man of large information and sound judgment could to teach correct agricultural principles, and to describe skilful farm practice. The editor of an agricultural periodical has opportunities possessed by no other person, of acquiring a knowledge of the real as well as the reputed status of the leading men in the agricultural world: the ability of a teacher is determined, not only by the accuracy of his knowledge, but by its fitness to the ignorance of others; and there is nothing like the extensive agricultural correspondence involved in the management of an agricultural journal either for learning or for indicating—whether the wants of the agricultural student or the sources whence they can best be supplied. An experience of this kind for several years enables us therefore to speak with some confidence of the services which Professor Low has rendered to the cause of agricultural progress. It may be that he has indicated what has been sound in the sanguine but uncertain writings and doings of the pioneers of that progress, rather than led the march himself—but his position was that of a guide and not that of a pioneer; and in thus reading the duties of his office, he has but given another proof of that safe and trustworthy judgment which has been the characteristic feature of all his labours. His volumes on "Practical Agriculture"—on "the Management of Landed Property," and on "the Economy and Natural History of our Domesticated Animals," will remain the substantial and well-filled store-rooms of the truth on their several topics for many years to come—the conclusive and most satisfactory testimony to his own useful labours as an agricultural teacher. In our own case, the gratitude due from a pupil, as well as the experience of many years, both in the field and at the desk, dictates this expression, both of the sincere esteem in which we are sure Professor Low has been held in the agricultural world, and of the regret with which the cause of his present retirement will be understood.

And we may congratulate the University of Edinburgh on the appointment of his successor. Professor WILSON, we understand, acquired his first knowledge of farm practice in one of the best cultivated districts of Scotland; and he has since then become well known in the scientific world as a chemist and geologist,—in the agricultural world as Principal for several years of the college at Cirencester—and generally as having had charge of the agricultural department of the Great Exhibition, as having been the commissioner appointed to report on the agricultural department of the New York Exhibition, and now as directing the agricultural department of the Crystal Palace at Sydenham

and as the commissioner appointed to take charge of British agricultural interests in connection with the great exhibition next year at Paris. It would be impossible to name any one whose appointment as successor to Professor Low could confer greater *éclat* upon the chair and the University, and difficult to name any one equally fitted for the discharge of the duties connected with the position to which he has been appointed.

For these duties are not confined to the detailed description of the field and home operations of practical agriculture. It may be that a discussion of all the items coming under the eye of the farmer between the 1st of Jan. and the 31st of Dec., is proper employment for the agricultural professor and his class—but both will be greatly mistaken if this is held to be the chief or the most useful employment to which their attention can be directed.

It is but a part of agricultural truth that can be got in at the ear; and we should consider students better taught from a chair, who should carry away from the lectures a glowing impression of the really intellectual character of the art, and a perception of its relations to those great bodies of truths which obtain under all circumstances of soil and climate, though they had learned in addition but a mere skeleton of agricultural truth, which however they could then readily clothe with flesh themselves in the field, than if they left with their memories crammed with data and details, without their judgments being improved or themselves enlightened. Better employ the 60 or 70 interviews between the professor and his students in equipping the latter *as* students, and so enabling them to learn their business in the field, where alone it *can* be learned, than in the vain attempt to teach an art by talking, which never yet was done, and which no one, we dare say it, will ever succeed in doing.

It is because Professor Wilson is so admirably qualified for thus discharging the duties of the office to which he is called, that the University and the agricultural world generally may be cordially congratulated on his appointment.

The permanent improvement of the soil is the same in effect as increasing its area. If, for example, we increase the annual produce of the United Kingdoms one-fourth, it is equivalent to increasing their area upwards of 19,000,000 acres, an increase only one-twentieth less than the extent of Ireland, and so on for any other proportional increase obtained.

But an increase of produce to the extent of one-fourth would be of greater value than an increase of acres equivalent to the area of all Ireland, for when we increase the fertility of the soil less seed and labour are required, whereas an increase of acres would give rise to the contrary.

Of the practicability of increasing the annual produce of the country to this degree there need hardly be two opinions, for every province bears evidence of it. Take an acre of Wheat land for an example, now yielding say 32 bushels per acre, and who will deny that by means of draining, trenching, claying, apparatus for liquid manuring, or some such permanent improvement or combination of them, its fertility may be raised to 40 bushels? and if this is possible on lands of this quality, what may be expected of those subject to greater improvement which now will not average even 15 or 20 bushels per acre, if so much, while we have 27,000,000 acres and upwards, of "meadow, pasture, and marsh land," still more susceptible of increase, and 15,000,000 acres of "improvable waste," now yielding a coarse and scanty herbage of only nominal value?

But the improvement of the soil involves more than agricultural possibilities—the work is not only practicable but profitable. The difficulties in the way, taking the one aspect of it, and the returns to be looked for in the other, may be illustrated by a case:—

A landlord has an estate of 7700 acres, of which 1900 are arable and gardens; 2700 meadow, pasture, and marsh land; 1500 improvable waste, and the balance, 1600, incapable of improvement for agricultural purposes, but in many cases possessing inexhaustible resources of minerals, which may directly or indirectly be brought to bear upon the improvement of the other divisions. On the arable land with draining, subsoiling, application of clay, sand, chalk, peat earth, when required, and the use of liquid-manure apparatus, &c., an investment of 10*l.* per acre on an average (some requiring more and some less) may be profitably made, and this we shall suppose will increase the produce 25 per cent. This is no doubt a very high average increase over a whole estate, but as we have never had less from a variety of experiments where the work was properly performed, in the vast majority of cases greatly more, we shall leave our readers to adapt their own experience to the example, as we are only contending for the principle. The average investment, it will be seen, is also large, and it is only where this is economically and judiciously invested that large returns can reasonably be expected. One of the greatest barriers to improvement of this kind with corresponding profits is "half done work." The thing may be illustrated by an instance within our own experience:—We had a field of wet clay land, drained 24 feet between the drains, at an expense of about 5*l.* per acre, and the increase was not more than 5 per cent. This was unsatisfactory, but on putting an additional drain between every two, and subsoiling the field, the increase was upwards of 30 per cent. in cereals, and more than 100 in Turnips and Grass. The total investment in the arable lands of our supposed estate will be 19,000*l.* Of the 2700 in Grass possibly two-thirds or 1800 should be broken up at an expense of from 12*l.* to 15*l.* per acre, and the remaining one-third or 900 acres drained, irrigated, and otherwise improved at an expense of 8*l.* Or judging from experiments made on soils of this class by ourselves, the highest and most profitable results could not be obtained under an average of 10*l.* The total investment under this head will be 27,000*l.* The 1500 improvable waste by draining, trenching, removing stones, trees, roots, levelling, &c., from an average of successful examples of this kind, also cannot be reclaimed and put in a profitable crop-bearing state under 20*l.* per acre. It is frequently done by degrees at less money out of pocket in the outset, but counting all costs and balances before the land is put in a proper state of fertility this is the most expensive mode of reclaiming land. Total investment on this division 30,000*l.*, grand total 76,000*l.*, tabularly stated thus:

Arable lands	... 1900 acres, at 10*l.* per acre	...	£19,000
Pasture, &c.	... 2700 „ „ „		27,000
Improvable waste	1500 „ 20*l.* „		30,000
Total	... 6100 „	...	£76,000

This investment may realise from 10 to 12 per cent., or say 8000*l.*, of which sum the landlord would get about the half from the tenants, or 4000*l.*, annually as interest, which would not redeem the principal in less than from 30 to 40 years; and as the work is a large one, it could not be finished likely in less time than this, so that 80 years would expire before the whole was redeemed and the estate freed of debt.

In the above example it is taken for granted that the tenants upon the estate are both willing and able to comply with the payment of interest and other obligations which would devolve on them, but how often is the contrary the case? for large investments of the kind in question require an increase of tenants' capital, and not unfrequently skill, to turn them to the best advantage, without which the investments themselves are not safe; and not only so, but the old system of the tenant is also liable to be overturned. Hence his objections. Next to "half-done work" in the drainage and other improvements of land, already noticed, the want of skill and capital on the part of the tenant to turn such improvements to a satisfactory advantage is, perhaps, the greatest barrier to their execution. And a third class of examples might be found in incumbered estates. Lands, whether freehold or not, are often so rackrented, mortgaged, or otherwise burdened, as to prevent the necessary security being given. On this head more need not be said.

Such are a few of those cases where landed interests are so problematically circumstanced as to check the progress of permanent improvements; and they are sufficient to show that some organised system of experiments is wanting, in order to test the increase of produce arising from certain physical changes in the circumstances of the soil produced by draining and other improvements, so as to afford a better guarantee to capital; for this will be found in almost every case to be at the root of those misapprehensions which prevent capital being invested in [one of the most productive enterprises in the kingdom. It will be perceived that the hypothetical example which we have quoted is just a ten-thousandth part of the whole kingdom, so that four ciphers added to the right-hand figure will show national results. Readers may make their own estimate as to the amount of expenditure and increase of produce; but whatever those may be, one conclusion is obvious, that the permanent improvement of land holds out a larger and more profitable field for the investment of capital than is to be met with anywhere else,—a consideration, however, which often cannot be taken advantage of, owing to the anomalous construction and circumstances of landed interests. This is the more to be regretted from the fact that this country may be called a nation of capitalists, from its commercial character; the immense capital and credit at its disposal affording facilities for the execution of the works at issue which no other nation has.

GUANO.

[We have received the following in the form of a printed slip, addressed to the farmers of Nottinghamshire.]

Before entering upon the subject of guano as a manure, I will relate to you a few interesting facts respecting it communicated to me by a friend (Captain Fyfe, brother to the editor of the *Nottinghamshire Guardian*), both as regards the extent of its supply and the sources of its production. Last year Captain Fyfe visited Peru and brought over from the Chincha Islands a cargo of guano. His account of these islands is totally different from any I have yet seen published, for instead of the guano being exhausted in 8 or 10 years, which most writers assert, he says, that the supply, comparatively speaking, is inexhaustible—the beds of guano being in many places more than 100 feet thick, and two of the three principal islands being yet untouched.

On climbing the cliffs an innumerable quantity of skeletons of large marine animals were presented to his view, such as those of the seal and walrus, or sea-horse, sticking up out of the surface, in such quantities that the place appeared to be completely white all over; and these account in some measure for the white lumps frequently met with in Peruvian Guano, which are no doubt the decomposed vertebræ of these animals.

Passing along over the island he could scarcely take a step without his foot breaking through into a hole in which the guano bird makes its nest.

These holes extend 5 or 6 yards into the bed of guano, and the birds are continually occupied in fetching fish from the sea to feed their young ones. The number is so immense that the air seems completely alive with them. By this account, on which the most implicit reliance can be placed, you will perceive that guano is not all excrementitious matter, as we have hitherto been led to suppose, but consists of a considerable amount of decomposed animal matter in addition to the excrement of birds. It is evident from this brief sketch that the supply of guano will be at present by no means limited, and therefore it rests with yourselves to petition Government, through your respective members of Parliament, to endeavour to devise means to get it imported into this country at a cheaper rate. I have no doubt that this could be done, if it were set about in good earnest, by some of the more influential of your body; not perhaps so quickly as our gallant fellows crowned the heights of Alma in the late terrible conflict in the East, but nevertheless I think it might be accomplished ere long. Of course the distance of the period will be in proportion to the extent to which you exert yourselves in the matter.

From a very remote period (about 2000 years) guano has been the chief manure applied to the land on the arid soils of Peru. As the quantity generally used does not exceed 4 cwt. per acre, you will perceive from the analysis below that this could not possibly supply all the alkaline salts which are required by plants. Professor Liebig says "we can only attribute the different quantities of guano necessary for producing the same results on different soils to the unequal quantities of ingredients necessary to vegetation contained in the soils, and not to those contained in guano. On a soil rich in alkali only a moderate quantity of guano is requisite; but on soils poor in alkalis it would take a large amount of guano to compensate for the want of potash or soda in the soil." The reason why the effects of guano are more uniform than perhaps any other artificial manure, with the exception of bones, is, that it contains a greater variety of the constituents of plants, that portion of it which is excrementitious matter partaking more of the nature and properties of farm-yard manure. Each of these bears a pretty equal resemblance to farm-yard manure, inasmuch as both of them supply phosphoric acid and ammonia, and both are derived, like it, from the vegetable food of animals.

Undoubtedly guano is the most useful manure that has ever yet been imported into this country, and the reason why guano which is found in our own climate is of far less value than the Peruvian, is that the greater part of the soluble portion of that which is produced in this country (in the islands of Scotland, for instance) is washed out by the rain. The following is one of the most recent analyses of Peruvian guano:—

Water	14.31
Salts of Ammonia	17.00
Organic Matter	33.23
Alkaline Salts	5.449
Phosphates	25.543
Salts of Lime	2.968
Sand, &c.	1.50
	100.000

The percentage of water in this sample, however, is rather high, I rarely find it to exceed 10 per cent.—that of silica 1 per cent.

It would be almost unnecessary to remind you of the immense extent of adulteration which is practised by some of the unprincipled dealers in this article, and therefore it is a matter of importance that you should be put in possession of an easy method of detecting these frauds. When guano is light (as regards the weight) and pretty uniform in colour, generally speaking, you may consider it good, but when you have any suspicion as to its genuineness the following mode of testing it is not only easy of performance but will yield you sufficiently accurate results:—Take 100 grains of the suspected sample, spread it carefully on a piece of writing paper, and lay it on the hob, which must not be so hot as to char the paper. When perfectly dry weigh it again, the loss of weight is the amount of moisture it contained with a very small quantity of ammonia, which would be driven off by the heat along with the

water. Then take the same dried and weighed sample, place it upon a piece of sheet-iron, and heat it over a bright fire until nothing but a white or grey ash remains —take it off the fire, allow it to cool, sweep it carefully into the scale and weigh it again; the loss indicates the amount of ammoniacal salts and organic matter. The ash must now be transferred into a teacup and well mixed, with half an ounce of spirit of salt (muriatic acid). If chalk has been mixed with the guano violent effervescence will take place, if not the effervescence will be very slight indeed. After this has been allowed to stand on the warm hob for five or ten minutes the undissolved portion must be well washed with clean water,—the eye will then easily be able to detect sand or brick-dust if there be any, which will remain at the bottom of the cup, the acid not being able to dissolve either of these. This residue must be carefully collected, dried, and weighed, which of course will give you the percentage of sand and rubbish, and the difference in weight will give the amount of the soluble salts (phosphate of lime, magnesia, &c.), minus the ammonia which was driven off by the burning on the iron plate.

To give you some idea of the proportions, 100 grains of good Peruvian guano ought to weigh 90 grains after being dried on the paper, 34 grains after being burnt on the iron plate, and about 1 grain when perfectly dried after being treated with spirit of salt.

It is always well to mix the guano, before being applied to the soil, with common salt or charcoal on account of the power which they possess of attracting moisture in dry seasons from the atmosphere. I have seen a mixture of the two of about three times the quantity of these to one part of guano attended with the most important results as regards increase of crop.

As it must ever be an object to economise the use of this valuable and expensive manure, the admixture of it with superphosphate and salt cannot be too strongly recommended; not only does the former of these make the guano go much further, but on account of it fixing the ammonia, both are improved in value. The better plan is to mix them together a few days before they are applied to the soil. *Samuel Parr.*

THE ECONOMY OF AGRICULTURAL LABOUR.

It is from labour that all our riches have been derived; from it we get our food, the necessaries, the conveniences, the comforts, and the luxuries of life. Without labour we must live, like the beasts of the field, on the natural produce of the earth; and even then the natural produce of the earth cannot be converted into use without labour. Labour, therefore, when properly applied gives to the soil its actual value.

The proper application of labour in cultivating the earth produces a greater and more beneficial result than the same amount of it applied on other matters; and as the value of everything is regulated by demand and supply, so is labour and the produce of labour. The price of labour properly employed in raising farm produce marks the natural price or value of it. By "the economy of farm labour" we wish to represent the arrangement, distribution, management, and employment of our forces in the production of our crops, and in converting them into food for man, and manure for our future crops.

We shall give the policy of a particular farm, and state the number of labourers we employ, the food which they and their families consume, the implements we use, the horse power required on our farm (consisting of 300 acres, 60 of which are in permanent pasture) for its proper management, the cost of the horses and of the food they consume, and the quantity of land required to produce their food, the expense of keeping them, and the implements which are used by them in proper working trim, and at the same value.

As labour is so essential an element in every well conducted farm, it is of the utmost importance to be able to direct the application of the labour of man and horse power so as to produce the greatest result; to accomplish this, a proper system is absolutely necessary in the application of it to make it profitable.

It is of the greatest importance for the employer of labourers to know the amount of work which an able-bodied man can perform properly in a day of 10 hours; this can only be acquired from experience. To acquire this knowledge, he must either put his hand to the work, or attend to the men when they are at piece work; and from this knowledge of the mode of working, and the quantity they perform, he may be able to fix the fair price of any work which must be done. There is, however, great variety in the easiness or difficulty of performing these, and he must be a good judge of the various kinds of work, and be able to fix a fair price for every description of work that is required.

In every department of labour there is a headsman, to whom orders are given for all those under him; and he must have experience in his particular department, to be able to execute the orders of his master, and have complete control over all those who work with him; and he must also have such an interest in his business, so as at all times and under all circumstances to have his orders executed in the best and most perfect way, according to the spirit and intention of his master.

Our farm is so small that the occupier acts as director and manager; he is the mainspring—directs, controls, and sees all his orders executed; but we find it best to have a foreman in each department of the labourers, who is accountable for the proper performance of the work they are about, and for the conduct of those who work with him. The first ploughman has the direction of, and is accountable for the work done by the other ploughmen, and sees that the horses are properly fed and cared for, and attends to all the implements which are placed under his care.

The shepherd, who is also cow man, has the care of the sheep, beasts, and pigs, and has boys under him during the summer, with the addition of a man during winter; the labourers have also a headsman, who receives orders from the master, and is accountable for the men who work with him, and for the proper performance of the work he is ordered to perform; and so have the women when they are weeding or hoeing, &c.

Our stated yearly labourers are four ploughmen, who work the horses; the shepherd and cow man. The shepherd and cow man is required to move the fold and attend to the sheep in the field morning and evening, and to those in the boxes to give them their food at the proper time; and he, as cow man, has to attend to all the beasts under his care; he mows clover in the field for the horses and for his beasts in the boxes, and pigs; he has a man to boil and mix the linseed and meal, and chaff, for the horses, beasts and sheep during winter.

The constant day labourers are five men; they are employed in performing every kind of work required on the farm which the yearly servants cannot perform. There are generally five women constantly; but during the hoeing of Wheat, planting Mangold, hoeing Beans, Carrots, Potatoes, Mangold, and Turnips, we have frequently from 15 to 20 women and boys, and we add to the number of hands just as many as are required to perform the work when it is required, whether in hoeing the land, in the corn harvest, or during the root harvest, so as to get the work done in proper time and with the greatest despatch.

All the hands we employ are paid in money on Thursday (once a fortnight); their wages are from 10*s.* to 14*s.* per week, the boys from 3*s.* to 7*s.*, and the women 5*s.* per week, or 1*d.* per hour—during harvest they earn much more than this, as they have task work.

We select the best able-bodied and most active, industrious hands, and as we give higher wages than any within many miles of us, we have no difficulty in securing the best workmen; and by doing everything we can by piece work, the men make much larger wages than when working by the day. We have no difficulty in getting any number of hands whenever we require them for work which, from circumstances of season or weather, requires to be performed immediately.

The following is a table of all the labourers employed for every week during the year, from the 26th day of March, 1846, to the 26th day of March, 1847, being 52 weeks:—

Date.	Money paid for piece work.	Regular work of a man.	Occasional Work. Days of a man.	Days of a woman.	Days of a boy.

	£173 8 11½	Days, 1560	1737	3005	2268

From the above table of the labourers employed on our farm for one year, if we take the 173*l.* 8*s.* 11½*d.* paid for piece work as affording employment to 1734 men at 2*s.* per day, then it will appear that there were 847 weeks of one man, or 16 men throughout the year constantly employed. The lowest wage was 10*s.*, and the highest 15*s.*, to the foreman.

The average is about 12*s.* per week for 15 men the year round	£507	3	5½
There were 3005 days of a woman, at 10*d.* per day ...	125	4	2
And 2268 days of a boy, averaging 7*d.* per day ...	66	3	0
This was the amount paid to the labourers for 1 year	£698	10	7½

This is equal to 16 men, 10 women, and 7 boys the year round on the farm, being the employment of 6½ men, 4 women, and 2½ boys, per 100 acres of arable land; or in money 2*l.* 18*s.*, per acre for the manual labour.

The number of individuals depending for support on the money we pay for the manual labour of our farm is—

10 married men, having 10 wives and 30 children	50	individuals
6 men are unmarried	6	„
Of the 10 women employed, two are the wives of two of the men. One of the women is a widow and has three children	4	„
One unmarried woman	1	„
The six remaining women have six children to support	12	„
Seven boys	7	„
	80	„

These 80 individuals depend entirely on the earnings of the labourers employed on the farm, for food and every necessary of life. Since the failure of the Potato crop, the food of the labourers in our neighbourhood has almost entirely consisted of bread of best seconds flour. Most of the families buy flour and bake their own bread; and we find from the information received from them that some of the families consume 3 pecks of 14 lbs. of flour per week, others 3½ pecks, and others 4 pecks; the average may be about 48 lbs. of flour. A bushel of Wheat of 60 lbs. weight will just produce 48 lbs. of seconds flour; we may therefore reckon that each of these 16 families of five individuals require and consume a bushel of Wheat weekly; the other food which they consume, from the account they have given us, averages 2 lbs. of cheese, 2 lbs. of bacon, 2 lbs. of butter, 1 lb. of sugar, and 2 oz. of tea weekly for each family, besides about 14 lbs. of Potatoes, the produce of their gardens; all of them have allotment gardens. The food consumed annually by the labourers employed on our farm may stand thus—16 families of five individuals each, in all 80 individuals.

1 bushel of Wheat weekly for 16 families × 52 weeks = 832 bushels, at 6*s.* 3*d.*...	£260	6	3
2 lbs. of cheese weekly for 16 families × 52 weeks = 1664 lbs., at 8*d.*	55	9	4
2 lbs. of bacon weekly for 16 families × 52 weeks = 1664 lbs, at 8*d.*...	55	9	4
2 lbs. of butter weekly for 16 families × 52 weeks = 1664 lbs., at 11*d.*	75	5	4
14 lbs. of Potatoes weekly for 16 families × 52 weeks = 42 sacks, at 8*s.*...	16	16	0
4 quarts of beer weekly for 16 families × 52 weeks = 3328 quarts, at 2½*d.*	34	18	4
The amount of food consumed, which may be of the farm produce	498	4	7
Rent of 16 cottages, at 1*s.* per week, with a small garden £41 12 0			
Say for coals, candles, and soap, 30*s.* for each family 24 0 0			
For clothes, &c., for each family, about 5*l.* 17*s.* 93 2 0			
	158	14	
Colonial Produce:—			
1 lb. of sugar weekly for 16 families, for 52 weeks, 832 lbs., at 6*d.* per lb. 20 16 0			
2 oz. of tea weekly for 16 families, for 52 weeks, 1664 oz., at 3*d.* per oz. 20 16 0			
	41	12	0
	£698	10	7

To produce the flour consumed by these 16 families it will require 26 acres, at 32 bushels per acre.

We do not enter into our own family expenses, as these form no part of the expenses of cultivation; they must come out of our income, and if the income is derived solely from the profits of the farm and interest of the capital employed on it, this will of course be the measure of our expenditure. *J. M.*

(To be continued.)

Home Correspondence.

Waste Lands.—This term comprehends all grounds that are unfit to bring crops to maturity by reason of the natural constitution of the soil, or by the adversity of the climate. Little control can be exercised over the latter element. In some few cases only has any alteration been effected on the climate of any country where an obvious influence has arisen from terrestrial conditions, as with stagnant waters and dense overgrown forests. Some benefit has been derived by draining and clearing; but in general, the effects of climate are beyond control. On the other hand, the most valuable and lasting alterations are possible with the soil. Good lands are rendered profitable by means of cultivation; indifferent soils are raised into value by application of energy and durable aid, while very poor lands are usable in a way that yields some degree of remuneration for the expenditure of time and capital. Experience very soon determines the altitude or elevation of position above the sea at which grain crops can be matured into ripeness. Green crops will grow at a much higher elevation; but as the two kinds of crops must be combined, the cultivation ceases with the ripening of grain crops. (!) Below that mark of elevation, no lands may remain uncultivated, except where the formation of the surface prohibits all convenience of operation. Wherever a railway-station is located, dwellings are placed and gardens are formed, by which it is shown that deep digging of the soil, whatever it may be, and constant manuring, produce a fruitful ground, which soon becomes a source of easy profit. The most obdurate clay, the most arid chalk, the most hungry sand, and

the most barren heath, are seen to be converted by these simple means into fruitful soils. *J. D.*

Average Wheat Produce.—Two correspondents of the *Times* calculate this year's produce — the one at 4 quarters, the other at 9 sacks. Without discrediting Mr. Mechi's returns, or those of any other high farmer, I would remark that if Mr. Caird, the *Times* Commissioner, is any way right, this year is supposed to be the most bountiful of many past. It undoubtedly is so; but to raise the following averages, as given by Mr. Caird (*vide* "English Agriculture," Longman, 1852), to 4 quarters, requires an excess of produce from other and better land scarcely credible. Not a single entire county is credited with a 40-bushel average, and only part of one that I could find (Lincolnshire fens) with 44; while, *e. g.*, Weald of Surrey is put at 12 to 20; Sussex do., 12 to 20; Essex, 28 to 32; Suffolk, 32; South Devon, 16 to 24; Norfolk, 36; Dorset, 20 to 22. As I know of much hill country (and a great portion of Wheat land must be on the hills) where 24 bushels are at least four more than usual, is it safe to rely on a general produce of 40 from Land's End to John o'Groats? *Simplex.*

Food of Cows and Sheep.—I shall feel greatly obliged by information on the following point. I keep 19 Ayrshire Cows and a short-horn bull, and they give me in

Butter and cheese, say	...	...	...	£190 0 0
Aid to pigs	...	...	...	10 0 0
Milk to calves	...	...	...	57 0 0
Manure at 2*l.*	...	...	...	38 0 0
Yearly			...	£295 0 0

How many Cheviot ewes and lambs will consume the quantity of Grass and Turnips required for the above cattle yearly? How many year-old cattle? How many two-year old cattle? I may thus be able to reply to friends who tell me sheep, &c., pay better than milch cows. *J. Mackenzie, M.D.*

Cross-bred Sheep.—Connected with the subject of crossing the smaller breeds of sheep with rams of a larger kind, as mentioned several times in your pages by Mr. Fowler, of Dartmoor, it may not be out of place to register a fact which has come under my notice since my residence in South Wales. A friend of mine purchased 12 months back a number of Welsh mountain ewes, the average price being about 13*s.* each. They were immediately put to a strong Southdown ram, and produced in due season some very strong and fine lambs. These being kept well, were soon fit for the market, and when slaughtered weighed from 7 to 10 lbs. a quarter, and sold at an average price of 20*s.* each. Some of the ewes have been killed off this autumn, and realised about the same amount. This I think is not a bad speculation, and one which may be copied with advantage, especially by those who have hilly poor land to manage. To see the lambs, especially the single ones, after they were six weeks or two months old, was quite laughable, for some of them were larger than the dam, and as is too frequently the case with overgrown children of the genus homo, looked like sucking the parent in good earnest. That the breed of small sheep should be much improved in size by crossing with larger rams is quite in the nature of things, for we see the same effect from similar causes throughout the animal kingdom. An increase of size is certain, and I should imagine a cross of the Southdown and Welsh mountain breeds could not be bad in quality—at least of the lamb I can speak from a "knife and fork" experiment, and it was excellent; and perhaps in the spring of next year I may be able to give a similar opinion upon the mutton. *W. P. Ayres, South Wales, Oct.* 30.

Farmers' Clubs.

Newcastle Farmers' Club, *Oct.* 21.—*Agricultural Statistics:* Mr. Burnett, of Black Hedley, read a paper on this subject. He said:—"There is an old and hackneyed saying, 'that facts are stubborn things,' and, if so, no one will attempt to dispute that facts alone form the soundest and most satisfactory basis of every improvement affecting any given branch of the nation's economy. Statistical facts, therefore, have ever been considered the safest and surest standards to form a correct judgment of the precise condition of any branch of trade. If that be so, how important must be the statistics in connection with a branch of the nation's resources, which has justly been termed the head of every other trade, viz.—Agriculture; a subject which, it is to be regretted, the legislature of this country has too long neglected, although it should have been their great business to compile as perfect and as complete returns of its exact condition as it was in their power to obtain. The want of such data accounts in a measure for the sudden and too often unexplained changes that have taken place in the minds and in the conduct of some great men, who, after spending a lifetime in advocating a given principle, have all of a sudden turned and supported another diametrically opposite to it; besides, this in a measure reaches those who have taken the trouble to search into the history of the legislation of the country, the secret of the many inconsistencies and incongruities which have characterised the proceedings of different governments in reference to agriculture generally. How do you account for these and similar other extreme changes, except from the absence of correct statistics, for without them every effort of the legislature bearing upon this branch of the nation's industry has been, and will ever be, but little better than like men groping in the dark. This is natural, as they never had a single fact to guide them. I know that the country possessed certain books professing to be the statistics of everything; but, after all, these were little better than guess-work—therefore, in regard to the real amount of produce of the land, it was entirely ignorant, as the Government never possessed a correct account of the quantity of surface land, with the grain produced upon it, or the expenses incurred in the producing of it. Thus, we neither have the number of acres used in growing corn, or as to whether the acres are increasing or diminishing; or whether or not the same amount of land was producing more or less corn than formerly. Yet, on the other hand, almost every other branch of trade lacked nothing calculated to further and promote it. It is true that we have statistics with reference to births, deaths, and marriages; also of corn imported and exported; and of coffee, tea, tobacco, &c.; nay, in short, everything but the staple product of the country. The first attempt to legislate in statistical matters connected with agriculture began, I believe, in a grant of 600*l.* being offered by the Commissioners of Woods and Forests to the Highland and Agricultural Society of Scotland—a society to which England owes much. This society, in carrying out the object of the Government, selected three counties for their experiments, viz., Roxburghshire, Haddington, and Sutherland; the two former being arable, and the latter Grass land—in order to test the result of the produce of corn and the rearing and feeding of cattle. The society accordingly had schedules printed containing the number of acres under different kinds of crops, the number not in crop, and the amount of stock. A copy of these schedules was sent to every occupier to fill up in these three counties. Now, to these schedules I wish to call attention, as they first asked for the contents of the farms in acres; secondly, the quantity of land in Grass; and, thirdly, the quantity of Wheat, Barley, Oats, and other grain grown upon them. It, however, struck my mind that these schedules were deficient in many respects. Now, it is well known that a correct account of acres cannot give a correct account of the corn produced in any country, as it is well known that in this county (Northumberland) the produce of farms varies from between 10 to 50 imperial bushels per acre. Therefore, it is plain that, to obtain a correct average of any country is rather a difficult and arduous task, and must be attended with great care and caution, as it will require a series of returns for many years before it can be satisfactorily accomplished—at least 15 or 20 years will be required for such a purpose. I cannot leave this part of my subject without thinking that the Highland Society, in selecting two corn-producing counties, viz., Roxburghshire and Haddington, might have the tendency to mislead as to the general and *bonâ fide* produce of the whole of Scotland. I would here suggest that, instead of each farmer filling up the returns asked for by these schedules (which would cost a deal of time and trouble), the best method would be for them to say how much stock and corn they took to the market every year; because, in obtaining an account of the produce of any country, it must be remembered that there is a great quantity of it consumed by the farmer in the keeping of his cattle: in the maintenance of his household, and in using for seed. Again, these schedules were imperfect in these returns, and, of course, defective, as they ought to contain a column for the farmer to return his annual loss of stock, viz., by death and other casualties. Now it may appear surprising to some people to state that the farmers lost more stock by death and other casualties than has ever yet been imported into this country; and this in itself was an important, but startling fact. If, therefore, these returns omitted to notice these things, how was it possible to know the precise amount of available stock each farmer had in his possession? But there was another omission, and that was the want of a column for the quantity of artificial food and manure used upon each farm. We know very well that inferior soils may for a time be made very productive through the application of such manures, but, he asked, would they in the end be profitable? The legislature should divide the country into districts, appoint to each a competent person to travel over them once every month, and report on the condition and progress of agricultural pursuits within them, and also speak to the appearance of the different crops as they were approaching maturity, and as to the aspect of the coming harvest. If such reports be transmitted to some Government office, where they could at any time be examined, all interested in agricultural pursuits might at once possess themselves of the exact condition of the country, and gain an idea what the result of the harvest might be. I know that some may say that we have plenty of agricultural reports—but what of that? I ask by whom are they written, and for what purpose? Are they written for the good of agriculture generally, or for some particular purpose? No, no; let me know who are the authors of such productions, and I then will tell you their value, and what amount of reliance can be placed upon them. On the other hand, if official persons were appointed by the Government, they would be compelled to give accurate and honest returns from every district in which they were placed. We know how precarious is the toil of the husbandman. For instance, on October 11, 1838, in a single night, when the thermometer fell 6° below freezing point, the whole of the Wheat that was not ripe was destroyed, and some which previously would have borne 20 bushels to the acre yielded no more than four, while it was not worth the seed for sowing. Then, again, in 1847, the frost, though not so severe, did great damage in one night; and then you must all remember the sudden destruction of the Potato crops in 1846. But we need not go further back than last year, when a heavy rain began on October 8, and continued for eight days, by which the standing corn was reduced to one-half of its value. Did not these and other facts show how precarious was the process of securing the crops, and how needful every possible care should be taken to watch and gather what remained sometimes late in the season, and was so speedily destroyed? The great importance attached to the appointment of Government officers will be easily perceived by all men of experience, but more especially by enterprising merchants and keen speculators, some of whom have already adopted plans similar to those I have suggested, and that, too, on an extensive scale, and, according to report, with great gain to themselves. One plan, I am told, was this:—A large house in Liverpool sent different agents into the corn-growing districts of the country, just about the time the crops were beginning to mature for the harvest. These agents purchased a square yard of corn as it grew in each field, which they immediately cut and sent off to Liverpool, where each sample was carefully proved; and the result of this scheme enabled the parties to form such a judgment as to the harvest as to guide them in all their operations in the trade for months to come. In conclusion, perhaps many of you will recollect that last year some Frenchmen came into the English markets and purchased largely, from the fact that their statistical information which they had previously obtained, showed them that there would be a deficient crop in France; and I will just submit the method they adopt in that country in regard to obtaining the statistics, and for which I am much indebted to a gentleman who furnished it for me:—'The machinery employed by the French Government to convey orders, or to procure statistical or other returns, is extremely simple, and works with great rapidity; thanks to the system of centralisation, by means of which remarkable results are obtained. Thus, to obtain any return—for example, information on the stock of grain, or the number of horses in France—the ministry of the interior, or of commerce, causes to be lithographed a circular, which is forwarded at the same time to the prefects of the 86 departments. By means of the railways now in existence, they are able, in less than two days, to send a despatch to the chief towns furthest from Paris, excepting Corsica and Algeria. The prefects immediately address this circular to the three or four sub-prefects of their departments, and the latter forward them to the mayors of the different towns or communes of their districts. Thus, in a few days, an order or a requisition, forwarded by the central Government, is distributed through the thousands of communes of the French territory, and the reply returns with the same celerity.' This is not the moment to discuss the advantages and disadvantages of the system of centralisation; but it is impossible to forbear observing the immense service which this organisation can render in certain circumstances, for example, when it is necessary to be assured of the subsistence of the people, or in time of war, &c. I think it is generally admitted that the success of the husbandman depends much on the seasons, and if ever proper statistical returns are made it will be found that the great proportion of Wheat is grown upon land, which does not yield more than 16 or 18 imperial bushels to the acre." Mr. Burnett then finished his paper by a quotation from M'Culloch's account of the British Empire, in which that author says, with regard to the quantity and value of agricultural produce, that "neither the Government nor the people of England has ever given any considerable encouragement to statistical inquiries; and, notwithstanding the heavy expense that is annually incurred in preparing parliamentary reports and accounts connected with statistics, it is still true that the elements of the science are as little understood here as in almost any other country. No effectual means have ever been set on foot for getting accounts of the extent of land in tillage and pasture, and of the proportion which one sort of crop bears to another, or of the numbers and value of the different breeds of cattle, horses, &c. In reasoning on these subjects, we have, therefore, nothing but the researches of a few meritorious individuals and analogies to trust to. Under such circumstances, precision is not to be expected; a rough average is all that can be looked for."

Notices of Books.

The Steam Engine, its History and Mechanism. By Robert Scott Burn. Ingram & Co. pp. 189.

In this profusely and well-illustrated volume, we have a concise and yet clear outline of the history of the steam engine, and of the successive changes which its more important parts have undergone since its first construction by Savary and Newcomen. Some of the descriptions are a little short, the author presupposing the reader to be acquainted with his "Mechanics and Mechanism," and this lessens the utility of the present volume, which, being evidently intended for those who know nothing of complicated machinery, should have been complete in itself. A more serious fault, however, is the introduction of cuts without sufficient matter explanatory of them. Fig. 57, for example, represents, we are told, Usher's steam plough, but we have not been able to discover any statement of its *modus operandi*. So, again, fig. 171 is a very complicated cut of "a double-geared engine adapted for screw propulsion," and although in this case we are told of what the apparatus consists, the absence of letters of reference to its various parts renders it impossible properly to apply the description to the drawing. Such omissions, and the

non-existence of an index, detract greatly from the value of a work which is in many respects useful and well adapted for the purposes of instruction or private study.

Miscellaneous.

Crop of Carrots.—Prize of 2*l.* awarded by the Manchester Agricultural Society to Mr. J. Balshaw, Hill house, Altcar, near Ormskirk. Claimant's farm contains 350 acres, and he had 26 acres in Carrots, grown on a good deep boggy soil, which was well drained, and had been many years in cultivation. The previous crop was Oats. Four lbs. of Carrot seed, of the Altrincham variety, was sown per acre, in the middle of March, and in drills 16 inches apart. The roots were too thick in the row, or, no doubt, the crop would have been heavier, but the claimant said they would not have sold so well if they had been larger. The land was fallowed and trench-ploughed in preparing it for the seed, but no manure was applied. The roots were very clean and sound, but not large. Crop very uniform, except on one side, near a game cover. Land rather deficient in cleanliness. Average weight, 29 tons, 17 cwt. 1 qr. 16 lbs. per acre. Weighed November 16, 1853. *Journal of Manchester and Liverpool Agricultural Society.*

Calendar of Operations.

NOVEMBER.

FORFARSHIRE GLENS, *Oct.* 31.—We have now reached the termination of a splendid season, and have safely harvested a most abundant crop; the only exception being the Potatoes; these too have been safely gathered, and are not very much diseased; the crop is light, and the tubers generally small, but the quality is excellent. The whole grain crops are unusually abundant and of superior quality, and if in any case there is either deficiency or bad harvesting, the husbandman alone is to blame; all the elements of production beyond his control have conspired to produce and afford facilities for securing abundance. A finer crop of Turnips has seldom been produced; some of the earlier sown had begun to languish for want of moisture, but within these few days copious rains have fallen, the soil is well saturated, and if hard frosts keep off, the bulbs will still swell out considerably. The disposable stock has been sold at prices highly remunerative; cattle have rarely been known to represent so great an amount of the circulating medium as at present, and all descriptions, fat or lean, have been completely cleared out. Sheep are not so extravagant in price as cattle, but are quite up to the mark; for high-conditioned animals the figure is a little above that of last year, and for inferior sorts rather below it. A long time of fine weather since the conclusion of harvest has afforded opportunity for carrying on improvements, besides keeping up the current operations of the farm, and preparations for next crop are in advance. Complaints have been long and loud of scarcity of water to drive mills; corn cannot be brought to market, nor fodder provided for stall beasts, but relief has now arrived; streams and rivulets that for months past have been almost dry, have again reached flood mark, and mountain springs begin to flow. It is by no means agreeable to turn at once from the fair to the dark side of the picture, but in reporting on rural affairs, it is necessary to speak of clouds as well as of sunshine. The contrast is great between the open-handed bounty of the omnipotent Creator and the oppressive selfishness of creature man. Game laws and game lairds are the curse of our Highland glens, and so will it be while the former are unrepealed and the latter have no higher aim than sport. A deadly contest is going on between the smaller tenantry and the wild animals, the issue of which, if circumstances change not, it is not difficult to foresee. Many a blue bonnet and gray plaid have yet to cross the broad Atlantic or the broader Pacific; some turned out at the expiry of a lease, others starved out during its currency. To the young, perhaps removal is no great hardship; wherever they go hope goes with them, and soon they may find themselves more comfortably settled in a more genial clime; but to the patriarch "whose few remaining hairs are silver gray," and whose life has been spent in his native glen where his fathers lived and died, removal is banishment; he may find another place of abode, but never another home. *S.*

WEST SOMERSET.—The autumn Wheat sowing is now nearly completed; we have experienced a most favourable season, and the young Wheat is remarkably promising. Our Mangold Wurzel is harvested, and although the roots are not so large as we have known them, still, as there were but few deficiencies, it must be considered a good crop. Swedes, from the long drought, became mildewed, and are small; those sown late are the largest. Vetches are strong. We are now threshing Wheat and Barley; there is a good yield, and a great burden of straw. The samples of Barley are scarcely as bright as usual, but weigh well. *W. P.*

Notices to Correspondents.

DECAYED LEAVES: *D H.* If made into a compost with vegetable earth and lime they are a good manure for Grass land.

INFLAMMATION OF THE UDDER: *Fanton.* Produced probably by a cold. Foment twice or thrice a day with hot water applied by means of flannel cloths, and afterwards rub in the following ointment—Hog's lard, 2 oz.; powdered camphor 1 drachm, mixed. *W. C. S.*

LIME: *C F P.* You may very well apply lime now for land to be next year in Potatoes. It will not interfere with the bone dust at all.—*J C W* We should doubt the policy of putting on lime now—before sowing Wheat. You had better put it on the stubble next year. It takes some time to operate, and will be all the more efficient on the succeeding grain crop, for the intervention of the year of the green crop. Get some nitrate of soda or guano for your Wheat in spring.

POULTRY: *A B.* The Bramah Pootra is as large a fowl as the Cochin, not so useful for hatching and rearing chickens, but a very good layer. It is now generally allowed to be a distinct variety, although still considered by many to be merely a half-bred Cochin.

RAPE: *J. Byrne.* You may, and we daresay do, grow Rape for green food; or even, though that is not consistent with your plan of husbandry, for the seed which may be a profitable crop, but your cheapest way of procuring Rape-cake is to purchase it; and in your use of it you will, of course, be cautious, as, indeed, our correspondent "Y" advises.

SMALL FARMS: *Youngster.* If you want a continuous supply of green food throughout the year, then, after having put half an acre in Lucerne, of your remaining five acres let one-sixth be in Vetches, sown in May; one-sixth in Rape, sown in May; one-fourth in Turnips, sown in June; one-sixth in Swedes, sown in June; one-fourth in Mangold Wurzel, transplanted in June after; one-fourth Rye, sown in September; one-fourth in Vetches, sown in September before the Turnips; one-sixth Italian Ryegrass, sown in September, before Swedes; besides this, you will have half an acre, which may be in early Cabbage, transplanted in September, and late Cabbage to follow. If you need straw, you must either purchase it, or you must diminish the extent of your green crop by the quantity of land put to Wheat. You will probably make 14 tons of green food per month by the above plan. This omits reference to the Grass land, however, and we will write another notice for next week.

FENCING & ALL OUTSIDE WOOD OR IRON-WORK.

WILSHERE AND CO.'S WATERPROOF BLACK VARNISH is the best article that can be used. One coat will go as far as two of ordinary paint. It bears a rich gloss. 4*s.* per gallon. Discount on large orders.

2, Talbot Court, Gracechurch Street, London.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge. ESTABLISHED A.D. 1700.

TEN THOUSAND STOVES.

THE TENTH THOUSAND OF THE PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, AND CO., 46, King William Street, London Bridge; and may be obtained of most Ironmongers.

The IMPROVED PATENT VENTILATING STOVE, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded post free.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

	Fiddle Pattern.	Thread or Brunswick Pattern.	King's Pattern.
Tea Spoons, per dozen	18*s.*	26*s.*	32*s.*
Dessert Forks „	30*s.*	40*s.*	46*s.*
Dessert Spoons „	30*s.*	42*s.*	48*s.*
Table Forks „	40*s.*	56*s.*	64*s.*

CAUTION.—Ford's Eureka Shirts are stamped, "38, POULTRY, LONDON," without which none are genuine.

*** Catalogues with particulars post free.

RICHARD FORD, 38, Poultry, London.

KNOW THYSELF.—Persons desirous of knowing the gifts, defects, talents, tastes, affections, and other characteristics of themselves or any friends in whom they are interested, must send a specimen of the WRITING, stating sex and age (including 13 penny postage stamps) to Miss GRAHAM, 3, New Road, Hornsey, Middlesex, and they will receive a minute graphiological delineation, written in a style peculiarly her own.—Testimonial from W. R. "Having seen several of your portrayals of character, and being much struck with the forcible truths contained in them, I should like your opinion of mine."—Miss H. S. "Your delineations are most faithful."—Miss Grove. "Your letter gave great satisfaction."—Miss Rosa C. "Accept my sincere thanks for your advice. I was exceedingly doubtful of him."

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, MOUSTACHES, &c.?—ALICE MELVILLE'S PALMAPILLA in all cases strengthens weak hair, prevents its falling off, checks greyness, produces a thick and luxuriant growth, dispels scurf and dandriff, and makes it clean, soft, curly, and brilliant in appearance. For baldness from any cause it is certain and effective; and for the production of Whiskers, Moustaches, Eyebrows, &c., in three or four weeks, it can be fully depended upon. Price 2s., sent post free (anywhere) on receipt of 24 penny postage stamps, by Miss MELVILLE, 25, Argyle Square, King's Cross, London.—"My whiskers are growing very thick." R. Mede, Esq.—"It restored my hair, which I had lost in patches." W. Sturt.—"It has quite checked the greyness." Miss Ellis.—"My Moustache is greatly improved." Capt. Ross.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

HOLLOWAY'S PILLS FOR THE CURE OF ASTHMA ARE UNPRECEDENTED.—Extract from a letter from Mr. Wild, of Hyde, Cheshire, dated August 5, 1854. "To Professor Holloway,—Sir, Mrs. Newton, residing in Hanover Street, in this town, was afflicted with Asthma for many years, a difficulty of breathing, and a violent cough, causing acute pains in her side, more particularly so when she took cold; she tried many remedies, and consulted different individuals without obtaining any favourable result. I then advised her to take your Pills, and after a few weeks she was considerably better, and by persevering with them she is now perfectly cured."—Sold by all Vendors of Medicine, and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

VALUABLE REMEDIES FOR THE AFFLICTED.

DR. ROBERTS'S Celebrated Ointment, called the POOR MAN'S FRIEND, is confidently recommended to the Public as an unfailing remedy for wounds of every description, a certain cure for Ulcerated Sore Legs, if of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples on the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1s. 1½d. and 2s. 9d. each.

Also his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience to be, without exception, one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are used in Scrofulas, Scorbutic Complaints, Glandular Swellings, particularly those of the neck, &c. They form a mild and superior Family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 22s. Sold Wholesale by the Proprietors, Beach and Barnicott, at their dispensary, Bridport; by the London houses. Retail by all respectable Medicine Vendors in the United Kingdom.

Observe.—No Medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott, late Dr. ROBERTS, Bridport," is engraved on the Government Stamp affixed to each package.

DR. DE JONGH'S

LIGHT BROWN COD-LIVER OIL,

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS. PRESCRIBED BY EMINENT MEDICAL MEN AS THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, RHEUMATISM, SOME DISEASES OF THE SKIN, RICKETS, INFANTINE WASTING, GENERAL DEBILITY, AND ALL SCROFULOUS AFFECTIONS —EFFECTING A CURE OR ALLEVIATING SUFFERING MUCH MORE RAPIDLY THAN ANY OTHER KIND.

Testimonial from the late DR. JONATHAN PEREIRA, *Professor at the University of London, Author of "The Elements of Materia Medica and Therapeutics, &c.*

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod Liver Oil. It was fitting that the Author of the best analysis and investigations into the properties of this Oil should himself be the Purveyor of this important medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the oil of which you gave me a sample; because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to your application. The oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours, (Signed) "JONATHAN PEREIRA.

"To Dr. de Jongh." "Finsbury Sq., London, Ap. 16, 1851.

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by

ANSAR, HARFORD, AND CO., 77, STRAND, LONDON, Sole Consignees and Agents for the United Kingdom and the British Possessions, and may be obtained from respectable Chemists and Druggists in town and country, at the following prices: IMPERIAL MEASURE, half pints, 2s. 6d.; pints, 4s. 9d.; quarts, 9s.

*** Four half-pint bottles forwarded, CARRIAGE PAID, to any part of England on receipt of a remittance of Ten Shillings.

BLAIR'S GOUT AND RHEUMATIC PILLS Price 1s. 1½d. and 2s. 9d. per box.—Mr. William Courtney, of Barton Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and give a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1s. 1½d. per box.—Observe that "THOMAS PROUT" is on the Government stamp.

MONMOUTHSHIRE.

TO BE LET, for a term of years, and entered upon at Lady-day next, the FARM of LLANVAIR GRANGE. It consists of 164 acres of rich productive Land, of which 4 acres are in Orchard, 76 in Meadow and Pasture, and 84 are Arable. There is a comfortable Farm-house and Garden, Dairy and Cheeseroom, and ample Farm Buildings on the Farm. It is within a short distance of the Pontypool Iron Works; there is a station on the Newport and Hereford Railway close by. At the Iron Works there is a constant demand for every kind of Farm produce. The proprietor at Llanvair Grange will direct some one to show the Farm; and for particulars apply to Mr. JOHN MORTON, Morningside, Nailsworth, Gloucestershire.

TO GARDENERS, SEEDSMEN, AND OTHERS.

TO BE LET, at a long lease and very low rent, a Large HOUSE and SHOP by the road-side, being a good chance.—Direct L. Y., 4, Royal Hill Row, Greenwich.

TO BE SOLD, by Private Contract, a Span-roof HOTHOUSE, measuring 22 feet long by 17 feet wide in the clear; also a Span-roof GREENHOUSE, measuring 39 feet long by 17 feet wide in the clear; was built about three years since. Has just been painted twice inside and out; is in thorough good condition, with two boilers, pipes, &c., all complete.—For further particulars apply to C. W. M., Post Office, Bushey Heath, Herts.

WILLEN HALL, EAST BARNET, HERTS.

TO BE SOLD, in large or small lots, a very valuable and extensive General Collection of GREENHOUSE and STOVE PLANTS, the Orange trees varying in height from 4 to 9 feet, beautifully covered with fruit in various stages; the Camellias, Azaleas, Gardenias, Epacris, and Rhododendron arbores, together with many other valuable Plants, are exceedingly clean and healthy. Any person wishing to form a collection, or improve their present one, will do well to avail themselves of this opportunity, as the whole will be sold a bargain on account of the family leaving.—Apply to JAMES HALLEY, Gardener, as above.

TO PIGEON FANCIERS.

TO BE SOLD, by a Gentleman who is about to leave his present residence, his entire STOCK OF PIGEONS, which have been selected from pure birds and at considerable expense. They consist of Archangels, Barbs, Jackobines, Almond Tumblers, Fantails (white and black), Nuns, and Carriers, as well as others. Also some very fine Cochin China Fowls. Price for the Pigeons, 8l.; (they have cost the advertiser about 30l.) Price for a Cochin Cock with two Pullets, 1l. 5s. 6d.—Address, prepaid, R. M. T., Post-office, Atherstone, Warwickshire.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

TO BE SOLD, a few first-rate GREY DORKING CHICKENS, very large, and bred from first prize birds. Price 10s. to 1 guinea each, according to age, weight, &c.—Apply inclosing stamped envelope, to R. ATKINSON, Singleton Park, Kendal.

TO BE SOLD, WHITE CHINESE, OR SWAN GEESE, very handsome for ponds, and prolific and very early breeders.—Mr. DUTTON, Delamere Rectory, Chester.

MR. ALEXANDER will Sell by Auction, at the Auction Mart, Bartholomew Lane, near the Bank of England, on THURSDAY and FRIDAY, November 16th and 17th, DUTCH BULBS, Standard and Climbing Roses, including most of the varieties of Perpetual and Bourbons recently introduced.

CHELTENHAM.

MR. J. C. STEVENS will Sell by Auction at Vittoria House, Cheltenham, on THURSDAY and FRIDAY, November 16th and 17th, at 12 o'clock precisely, the Valuable Collection of PLANTS, the property of the late Courtland Shaw, Esq., M.D., deceased, consisting of Specimen Orchids, Stove, Heath, and Greenhouse Plants; Cucumber and Melon Frames, Garden Tools, &c. May be viewed two days previous to the sale.—Catalogues on application at the *Journal* Office, Cheltenham; or at the Auctioneer's Office, 38, King Street, Covent Garden, London.

CAMELLIAS, RHODODENDRONS, AZALEAS, DEUTZIA GRACILIS, ETC.

THE FOURTH AND LAST CONSIGNMENT FROM MR. JOS. BAUMANN, OF GHENT, FOR ABSOLUTE SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on MONDAY, Nov. 20, at 12 for 1 o'clock, 1000 Camellias, 250 Deutzia Gracilis, 150 Seedling Amarylis, 250 New Hardy Ghent Rhododendrons, 60 Yellow Rhododendrons, 25 Ghent Azaleas, 500 Gladiolus gandavensis, Lilium lancifolium, &c. May be viewed on the morning of Sale, and Catalogues had.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MR. KIRKE will Sell by Auction, on the Premises, opposite Chelsea Park, Fulham Road, on WEDNESDAY, Nov. 15th, at 1 o'clock, by order of Mr. Shearman, a fine collection of BULBS, EVERGREENS, SHRUBS, &c., comprising about 15,000 Narcissus, Hyacinths, Tulips, Crocuses, &c., Camellias in full bud, Hoya carnosa, Passiflora Bonapartia, fine large Aucuba japonica; Laurels, Chinese Privets, variegated Hollies, Yews, Sweet Bays, Lilacs, Yuccas, Rhododendrons, Arbor-vitæ, Evergreens, Privets; Standard and Dwarf Roses, Peaches, Nectarines, Apricots, and Mulberry Trees, Seeds, Asparagus Plants, &c.; Light Spring Cart, &c.—May be viewed the day prior to the Sale. Catalogues had on the premises; and of Mr. KIRKE, 19, Brompton Row.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on TUESDAY, November 14, and THURSDAY, the 16th, at 12 o'clock, a first-class Collection of DUTCH BULBS, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Anemones, Crocus, Snowdrops, Tulips, &c.; also a selected assortment of Standard and Dwarf ROSES, Ornamental Trees, and American Plants, well set with bloom, buds, &c. On view the mornings of sale.—Catalogues to be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by the proprietor (in consequence of the ground being let for building) to Sell by Auction, without reserve, on the premises, London Fields, Hackney, on MONDAY, November 13, at 11 o'clock, the entire NURSERY STOCK, consisting of Elms, Chestnuts, Limes, and Poplars; also about 600 Variegated and Green Hollies, Irish Ivy, Aucubas, Box, fine Moss and other Roses, &c. On view prior to the sale; Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM, SURREY.—FINAL SALE.

TO NOBLEMEN, GENTLEMEN, EXHIBITORS, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the administrators of the late Mr. Joseph Fairbairn to sell by Auction, without reserve, on the premises, the Clapham Nursery, Clapham, near London, on MONDAY, November 20, 1854, and following days, at 11 o'clock each day, the whole of the valuable and extensive stock of CHOICE GREENHOUSE and STOVE PLANTS, which is particularly worthy the attention of Noblemen and Gentlemen enriching their collections, as well as the Trade, from its excellence; comprising 50,000 choice Ericas; 10,000 Epacris; 4000 Indian Azaleas; 2000 Aphelexes; 1000 Double Camellias; 5000 Camellia Stocks; two Allamanda purpurea; New Double White and Purple Primula fimbriata, Cyclamen persicum, Daphne indica, rubra, and every variety of Stove and Greenhouse Plants in cultivation; magnificent young specimen Heaths, &c. Also the entire stock of fine Evergreens, Ornamental Trees, and Deciduous Shrubs, including large Green and Variegated Hollies, Box, Yews, Aucuba, Laurels, fine Araucaria imbricata, Cryptomaria japonica, Cedar Lebanon, Cedrus Deodara, &c.; together with several 3 and 4 Light Boxes; Pits; 300 Bell Glasses; 3 Capital Tumbril Carts; 1 Spring Cart; 2 Useful Horses; 2 sets Harness; Iron Rollers; Garden Tools; Wheelbarrows, and sundry effects.—May be viewed one week prior to the Sale. Catalogues may be obtained (6d. each, returnable to purchasers) on the premises; at the Seed Shop, High Street, Clapham; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

PETER LAWSON AND SON,

SEEDSMEN, NURSERYMEN, AND WOOD FORESTERS, IN SCOTLAND,

TO THE QUEEN'S MOST EXCELLENT MAJESTY,

AND TO THE HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, &c.

LONDON BRANCH: 27, GREAT GEORGE STREET, WESTMINSTER.

PETER LAWSON AND SON, in submitting the following List of FOREST and ORNAMENTAL TREES, beg to state that their stock is in very fine condition this year, and the LARCH and other trees quite free from the prevailing disease. Their Nurseries extend to upwards of 100 acres, and from being well exposed, and the soil light, the Plants are very hardy and well ripened, and calculated to give satisfaction when planted in unsheltered situations.

SEEDLING AND TRANSPLANTED FOREST TREES.

Doors open to the public from 1 till 4 o'clock at 1*s*. admission; from 4 to 7 o'clock at 6*d*. List of Prizes, &c., may be obtained of GEO. SMITH, Hon. Sec., Hornsey Road, Islington.

THE SCOTTISH GARDENERS' AND LAND-STEWARDS' ASSOCIATION.

At a General Meeting for the Election of a Pensioner on the Funds of the Association, held at 6, York Place, Edinburgh, on November 8, 1854, Professor BALFOUR in the Chair, the following was the state of the Poll at the close of the Ballot.

ISABELLA STEWART 375 Votes | MALCOLM M'GREGOR 117 Votes.

ISABELLA STEWART, having the greatest number of Votes, was thereupon declared duly elected. JAMES M'NAB, P. S. ROBERTSON, } *Scrutineers.*

Edinburgh, Nov. 9, 1854. J. H. BALFOUR, *Chairman.*

THE WEST OF ENGLAND HORTICULTURAL BUILDING SOCIETY beg to announce to Amateurs of the ennobling Science of Horticulture that they have made arrangements for the Erection of superior Buildings, of a lighter and neater appearance then have hitherto been designed, at the same time paying due regard to strength and durability. The Ventilation and Construction being of the newest and most approved principles, and at prices as low as possible.

Orders received by the Acting Agent, W. J. DRAKE, 4, Alma Place, Summerland Street, Exeter, who has been practically engaged in the management of a similar department for the last ten years with Messrs. Veitch & Son, of the Topsham Road Nurseries, Exeter.—Nov. 18, 1854.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.

Seed Establishment, 181, High Holborn, London.

ROSES, HOLLYHOCKS, ETC.

ROSES to force, or to form beds at once. See S. WALTERS'S ADVERTISEMENT, page 706.

THE PLANTING SEASON.

WM. URQUHART AND SONS, Dundee, respectfully intimate that their PRICED LIST may now be had on application.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER'S descriptive List of the above splendid flowers, containing hints on their culture, and observations on exhibiting, &c., is now ready, and may be had on application, by forwarding one postage stamp.—Saffron Walden Nursery, November 18.

SUTTON'S AUTUMN CATALOGUE is now published, and will be sent post-free on receipt of one penny stamp.—Address SUTTON and SONS, Reading, Berks.

PETER LAWSON & SON, Edinburgh, the QUEEN'S SEEDSMEN, &c., respectfully acquaint their patrons in England and the public, that their PRICED LIST of PLANTS for the season is now ready, and may be had on application, at their Branch Establishment in London.

All orders sent to the London Branch will be immediately executed, and delivered in London free of expense.

27, Great George Street, Westminster, November 18.

LARGE FIRS AND FOREST TREES.

MESSRS. WILLMOTT AND CHAUNDY, of Lewisham, have to dispose of, at low prices, in consequence of the ground (12 acres) having to be cleared for building on, a quantity of large FOREST TREES and FIRS of various kinds. they will come up with good roots.

They have also an extensive stock of large well-grown Evergreens of various sizes, that will come up with good balls.

FORRES NURSERIES.

JOHN GRIGOR AND CO., Nurseries, Forres, have for sale a large stock of true native SCOTCH HIGHLAND PINE PLANTS, LARCH, DEODARA, and FOREST TREES in general. The numerous premiums awarded by the Highland and Agricultural Society of Scotland for raising true native Highland Pine Plants, have all been awarded to J. G. & Co.

Priced Lists forwarded on application, and the trade supplied at the wholesale rate.

SPLENDID CONSERVATORY PLANT.

FUCHSIA DOMINIANA.—A beautiful example of this truly gorgeous plant was exhibited at 21, Regent Street, on the 7th inst., and without any exaggeration it may be said to have been the admiration of every one. There is now no doubt that it is one of the finest autumn and winter flowering conservatory plants we have. The merit of raising this beautiful plant is due to Mr. Dominy, the Foreman of the Plant Department at the Exeter Nursery; it consequently bears his name as a memento of his zeal and ability in the performance of his duties. It is a seedling between Serratifolia multiflora and spectabilis, having the fine free growth of the former and the splendid flowers of the latter.

A few extra strong specimen plants, 2 to 3 feet ...	21s. 0d.
Fine large plants	10 6
Small Plants	7 6

Exeter and Chelsea Nurseries, Nov. 18.

N.B. The specimen exhibited on Tuesday can be seen at Chelsea.

SONERILA MARGARITACEA.—This lovely Plant was exhibited at the Horticultural Society Rooms, 21, Regent Street, on the 7th inst., and was the gem of the exhibition. (See report in *Gardeners' Chronicle*). It is perhaps the most chaste of all variegated plants, producing, with its dark glossy green leaves, dotted all over with silvery white spots, a profusion of beautiful crimson flowers, with yellow stamens. It is a dwarf compact plant, of particularly neat habit. It requires the temperature of a cool Stove or a warm Greenhouse.

Messrs. VEITCH & SON are now prepared to supply plants of the above, and have no hesitation in saying that this is one of the most lovely and delightful little plants it has ever been their good fortune to introduce.

Plants at 21s. each, with one over on three to the Trade.

Nurseries, Exeter and Chelsea, Nov. 18, 1854.

N.B. The Plant exhibited on Tuesday is now at the Exotic Nursery, Chelsea, and can be seen by the public.

ROSES.

WILLIAM WOOD AND SON, having a large stock this season, beg to offer fine strong Plants of the following kinds of HYBRID PERPETUAL ROSES, budded on fine selected stocks, from 4 to 6 inches, well suited either for potting or for planting in masses in the Rose Garden.

AT 15s. PER DOZEN (when one dozen of a kind is ordered):—Auguste Mie, Baronne Hallez, Baronne Prevost, Charles Boissière, Duchess of Sutherland, Duplessis Mornay, Egérie, Géant des Batailles, Jaques Laffite, La Reine, Le Lion des Combats, Louise Odier, Madame Trudeaux, Pius the Ninth, Reine des Fleurs, Robin Hood, &c. &c. &c. Pius the Ninth is particularly recommended as a pillar Rose of extraordinary growth, budded plants of this kind in the Woodlands Nursery having made shoots from 5 to 6 feet in length this season, and flowers until very late in the year.

AT 10s. PER DOZEN (Hybrid Perpetual Roses): — Augustine Mouchelet, Duc d'Aumâle, Lady Fordwich, Madame Laffay, Marquise Boccella, Marquis of Ailsa, Mrs. Elliot, Prudence Rœser, William Jesse. &c.

N.B. The Trade supplied on liberal terms. Catalogues may be had in exchange for two postage stamps.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

THREE NEW ROSES.

DUCHER, ROSE FLORIST, Rue du Vivier (Guillotière, Lyons, (France).

THE LOUISE DE SAVOIE.—Growth vigorous, foliage dark green, buds large and very long, flower very large and full, colour sulphur to light yellow; blossoms very freely; resembles Chromatela, but superior. Strong plants, 15f.

CICERO, HYBRID PERPETUAL.—Growth very vigorous, foliage light green, buds large and long, flowers very large and almost flat, in two distinct colours, the centre variegated, and the edges of the petals dark crimson; blossoms very freely; curious perfume. This is a very remarkable Rose. Strong plants, 12f.

DEUIL DE F. WILLERMOS.—Growth moderate, flower medium full, colour dark purple shaded to black, the darkest of this class; blossoms very freely. Strong plants, 15f.

NEW CLIMBING HYBRID PERPETUAL ROSE, THE "DUCHESS OF NORFOLK."—Colour, Vivid Crimson.

To be sent out for the first time about the end of October.

WILLIAM WOOD AND SON beg to refer to their advertisement in the *Gardeners' Chronicle* of September 30, page 627. Standards, half-standards, or dwarfs will be supplied at 10s. 6d. each, with the usual allowance to the trade.

N.B. When six plants or more are ordered by the trade, a very considerable reduction will be made beyond the usual discount, particulars of which may be had on application.

A Drawing of the above may be had for 6 Postage Stamps.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Baghshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be tained.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

GEORGE JACKMAN begs to announce that he has just published a new and complete CATALOGUE of his Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.

Woking Nursery, 1¼ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—November 18

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Their new descriptive Fruit Catalogues, Ornamental Trees and Shrubs, American Plants, choice Rhododendrons, Roses, &c., can be had on application.

Pine-apple Place, Edgeware Road, London.

New Gardens and Greenhouses furnished on moderate terms.

Albion Nursery, Stoke Newington, London.—Nov. 18.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to recommend to the attention of Gentlemen and others engaged in Planting, the following plants from his general Stock, they are in fine healthy condition. The American Plants annually exhibited at the Royal Botanic Gardens, Regent's Park, are supplied from this establishment.

RHODODENDRONS.—The following is a selection of the most admired scarlet, rose, and high-coloured varieties in cultivation; are perfectly hardy, and bloom for the most part during the month of June.

Blandyanum, fine rosy crimson	5s. to 7s. 6d. each.
Lady Eleanor Cathcart, vermilion rose and dark crimson spots	21s. 0d. "
Lady Wenlock, bright crimson	21s. 0d. "
Atrosanguineum, dark scarlet...	10s. 6d. "
Alaric, dark purplish crimson	7s. 6d. "
Omer Pasha, dark crimson, new	10s. 6d. "
Juba, crimson, intensely marked	10s. 6d. "
Lefevreanum, crimson, tinged with purple	10s. 6d. "
Attila, dark crimson	7s. 6d. "
The Grand Arab, fine glowing crimson	7s. 6d. "
Brayanum, crimson	10s. 6d. "
Nobleanum bicolor, crimson, white eye	7s. 6d. "
Vandyke, light crimson...	10s. 6d. "
Blatteum, dark purplish red	7s. 6d. "
Rubens, light rose	10s. 6d. "
The Duke of Norfolk, clear rose, fine	10s. 6d. "
Celebrandum, dark crimson purple	10s. 6d. "
Rembrandt, fine crimson	10s. 6d. "
Congestum roseum, fine rose, well marked	21s. 0d. "
Roseum novum, clear rose	10s. 6d. "
Leopardi, rosy purple, and very much marked ...	5s. 0d. "
Floribundum coccineum, fine	10s. 6d. "
Erectum, good crimson	7s. 6d. "
Towardianum, large rose, fine...	10s. 6d. "

For planting extensively, no kinds of Rhododendrons are better calculated for a display than the varieties of the noble Catawbiense; they are all perfectly hardy, producing fine trusses of blooms of various hues—scarlet, rose, purple, white, and spotted white. The list below contains the leading kinds:—

Catawbiense, good bushy plants, 50s. to 63s. per 100.
" larger, 1½ to 2 feet, 12s. to 18s. per doz.
" seedlings, fine bushy plants, 12s., 18s. to 24s. per doz.

Catawbiense bicolor	Gloriosum
" splendens	Sherwoodianum
Album elegans	Bouquet de Flore
" grandiflorum	Melanthauma
Cæleste	Pictum
Cyaneum	Roseum elegans
Candidum	Victoria
Delicatissimum	Maculatum nigrum
Egregium	" purpureum
Everestianum	Macranthum
Finibriatum	Nivaticum
Mirandum	Perspicuum
Lindsayanum	

Good strong well established bushy plants, 30s. to 42s. per doz. Larger plants can be supplied at a corresponding advance of price.

STANDARD RHODODENDRONS.—Of these, without doubt, we possess the largest stock of really good kinds. Nothing can be more imposing when in bloom than a handsome standard. We have them 3 feet to 5 feet stems, and handsome symmetrical heads. The price of such would range from 42s. to 105s. each.

Rhododendron ponticum, good plants, 10s. 6d. per 100; larger, 1 to 1½ to 2 feet, 12s. 6d., 15s. to 25s. per 100. This is especially worthy the attention of planters; it will thrive in any soil, and in the most severe weather; is never injured by hares or rabbits. Unquestionably it is by far the best shrub for under cover.

KALMIA LATIFOLIA, good bushy plants, 60s. per 100; larger, 12s., 18s. to 24s. per dozen.

HARDY HEATHS, in 20 fine, named, varieties, many of them well suited to form edgings for larger clumps, 35s. to 42s. per 100.

HARDY AZALEAS.—A good assortment, if left to our selection, suitable for extensive planting, 1 to 1½ and 2 feet, 37. 3s. per 100. The very best selected Ghent and other varieties, 18s. to 30s. per dozen. These produce flowers of all colours—scarlet, rich orange yellow, rose, and white.

STANDARD ROSES, of the most approved Perpetual and Bourbon varieties, 3 to 4½ feet stems, 18s. per dozen.

PINUS Douglasi, handsome seedling plants, 3 to 4 and 6 feet.
" insignis; we strongly recommend our stock of this justly admired Fir, all of which are from seed, 2 to 3, 4, & 5 ft.
" cembra, 3 to 4 and 5 feet.—Pinus excelsa, 3 to 6 feet.
" macrocarpa, 2 to 3 feet.
" Lambertiana, very handsome, 3 to 4 feet.

Araucaria imbricata, splendid formed specimens, 2 to 4 feet.
Cedrus deodara, of all heights, from 1 to 8 feet. We have a large quantity about 4 to 6 feet.
" Africana, 3 to 4 feet.
" Lebanon, handsome grown specimens, 3 to 6 feet.
Cryptomeria japonica, 3 to 12 ft.—Libocedrus chiliensis, 2 to 3 ft.
Fitzroya Patagonica, 2 feet.
Cupressus Goveniana, 3 to 4 feet.
" Lambertiana, 3 to 4 and 5 to 6 feet.
Irish Junipers, 4 to 5 feet.—Irish Yews, 4 to 8 feet.

The above-named Coniferous Plants have been frequently transplanted, are perfect specimens, and have never been grown in pots. Prices will be forwarded on application.

J. W. begs respectfully to solicit an inspection of his stock, from those who are engaged in planting. A Catalogue, containing full descriptions of his celebrated Collection of Rhododendrons, as exhibited by him at the Royal Botanic Gardens, Regent's Park, can be obtained by inclosing two Postage Stamps.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to announce that they are now sending out the following new Plants:

HELIOTROPIUM, BEAUTY OF THE BOUDOIR; the best for Garden and Pot Culture.

CHRYSANTHEMUM, ANNIE HENDERSON; the summer flowering variety; colour yellow, and form of Annie Salter; very dwarf.

GERANIUM, PRETTY POLLY; the loveliest hybrid bedding Geranium; colour, orange salmon.

ACHIMENES HENDERSONI; the newest and prettiest hybrid variety out.

FANCY GERANIUMS: CLOTH OF SILVER, EVENING STAR, and CRYSTAL BEAUTY; for form, colours, and general good qualities unequalled.

CINERARIAS, MRS. ROGERS, MRS. GERARD LEIGH, FASCINATION, and PRINCE OF PRUSSIA. (No further orders can be executed for Mrs. Rogers and Mrs. Gerard Leigh until next spring.)

See Autumn Catalogue for full descriptions, price, &c. &c.

The NEW RHODODENDRONS discovered on the Bhootan Alps, by THOMAS J. BOOTH, Esq., surpassing in magnificence of flower the Sikkim species. Full particulars of them will be seen on reference to their Spring Catalogue.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for GERANIUMS (show and fancy), FRENCH GERANIUMS, FUCHSIAS, VERBENAS, FAIRY ROSES, CHRYSANTHEMUMS, HELIOTROPES, CINERARIAS, CALCEOLARIAS, PRIMULAS, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

The stock of show Geraniums exceeds 50,000, and comprises upwards of 750 varieties, amongst which almost every known kind will be found. The newest sorts, such as Carlos, Virginia, Rosa (Foster's), Leah, Picta, Marginata, Empress, Neatness, &c., can be had at 3s. 6d. each, or 40s. per dozen. The older varieties from 9s. to 25s. per dozen.

The selection of FRENCH GERANIUMS consists of 40 distinct sorts (exclusive of those English Geraniums which some class with them), at 2s. 6d. each, or 25s. per dozen.

SEEDLING CINERARIAS (10,000), from seed of first-rate flowers, at 4s. per dozen, in 60-sized pots.

20,000 SEEDLING HERBACEOUS CALCEOLARIAS now on hand at 4s. per dozen in 60-sized pots. These flowers have been raised from the seed of the best of last year's stock, which received general praise.

An immense quantity of good fimbriated PRIMULAS at 4s. per dozen in 60-sized pots, and 6s. per dozen in 48's.

CHRYSANTHEMUMS (Lilliputian and large flowering) at 6s. and 9s. per dozen for plants which will flower this season. Large magnificent plants at 18s. and 15s. per dozen—all the best sorts.

The foregoing have been selected as examples only, it being impossible within the limits of an advertisement to afford particulars of a stock so extensive; Catalogues will, however, be forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, PROPRIETOR.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high: as handsome as plants can be.	Pinus canadensis, 3 to 8 feet
Cedrus Deodara, in any quantity, from 1 to 3 feet high	Cupressus macrocarpa or Lambertiana, 4 to 7 feet
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants	" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Cedars of Lebanon, 3, 4, 6, and 10 feet high	Juniperus, Upright Irish, perfect columns, 3 to 7 feet
Pinus Douglasi, 3 to 10 feet	" chinensis, 2 to 8 feet
" insignis, 2 to 7 feet	Yew, common English, 3 to 8 feet
" Menziesi, 3 to 7 feet	" Irish, 4 to 10 feet
" pinsapo, fine plants, 3 to 6 feet	" gold-striped, 1½ to 3 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome	" do., tall standards, 4 to 7 ft.
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders	" Dovaston, or Weeping, worked on tall straight stems
" Montezumæ, 2 to 4 feet	Thuja aurea, the finest plants in the country
	Libocedrus chilensis, the finest plants in the country
	Large variegated Hollies
	" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2d. stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

TO THE AGRICULTURISTS OF ENGLAND.

GARRADINE'S "NE PLUS ULTRA" WHEAT.—A single ear of this wonderful Wheat, which was purchased five years ago of a soldier on tramp, who brought it from some distant country, was sown in 1849; the produce of this was again sown in 1850, and also in 1851, when it yielded at the rate of 19 coombs, 1 bushel, and 1 peck per acre. This induced me to continue its cultivation. A sheaf and a quantity of corn will be shown on Messrs. Garratts' Stand in the Agricultural Department of the Crystal Palace, by which its quality and general character may be seen.

The following Gentlemen kindly lent me portions of their land last season, to test the producing quality of the Wheat, and up to this year not one kernel has been sold for seed. The quantity sown on all the varieties of soil has in no instance exceeded 4 pecks per acre. On land of Mr. Wasdale, in the parish of Woodhurst, this Wheat was sown after Tartarian Oats, Clover, Seeds, Peas, and Tares (some being sown in February, and equally productive). On land in the occupation of Mr. Gadsby, in the parish of Godmanchester, 1 acre, the yield of which has been 30 per cent. over his own Wheat, grown in the same field, and has been tested by several Agriculturists in the neighbourhood. On land in my own possession, in Needingworth and other places (both Fen and Highland), it has been sown after Wheat, Clover, Barley, Beans, Oats, and Fallow, and in every instance has been most productive.

I am prepared to part with a limited quantity, which can be had on application to me, at 25s. a bushel. All orders to be accompanied by a remittance.

JOHN THANG HARRADINE, Needingworth, St. Ives, Huntingdonshire.

PRICED NURSERY CATALOGUES.

A PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, Roses; B, Ornamental Trees and Conifers; C, Fruit Trees; D, Herbaceous Plants; F, Greenhouse Plants, &c.; G, Seeds; H, Hollyhocks; I, Bulbs.—Nurseries, Cheshunt, Herts.

PELARGONIUMS.

J. DOBSON AND SON beg to announce that their New DESCRIPTIVE CATALOGUE of the above, containing full descriptions of Beck's new and beautiful Seedlings, and the best of other raisers, may be had on application.

J. D. & Son beg to state that their stock of Pelargoniums are particularly strong this season. First-rate selections from 12s. per dozen.—Woodlands Nursery, Isleworth.

SUPERB DOUBLE HOLLYHOCKS.

JOSEPH BUTLER, Gardener to R. Hills, Esq., Colne Park, near Halstead, Essex, begs to announce that he has now ready for sending out a large stock of extra strong plants of nearly all the varieties yet sent out; also some superb new varieties of J. B.'s own raising.—Descriptive Catalogues will be sent post free on the receipt of a postage stamp; also Seed saved from J. B.'s superb collection: 150 Seeds mixed for 12 postage stamps. Collections, consisting of well contrasting colours, at 6s., 10s., 15s., and 25s. per dozen; if left to J. B.'s own selection good double contrasting colours for Borders, not named, 4s. per dozen. A remittance is solicited from unknown correspondents. Post Office orders, payable at Halstead, Essex.

QUINCE STOCK PEARS.

H. WALKER, Londonderry, offers the following:—

5000 1 year PEARS, on Quince Stocks, 2 to 5 feet, in 50 best sorts ... ... per 100	50s.	0d.

Carriage free to London.

NEW CRIMSON DAHLIA "INCOMPARABLE."

MR. E. ABLITT begs most respectfully to announce to the Dahlia Trade that he purposes disposing of the above named splendid Seedling Dahlia in ground roots. Colour rich ruby crimson, fine shape, with great depth of well arranged petals and good centre; it has been shown at most of the exhibitions in the neighbourhood, and greatly admired. Mr. Glenny also speaks of it in very high terms as one of the best in the crimson class.

☞ See Glenny's Almanack for this year, and Lloyd's Weekly Newspaper for October 29th, initials E. A., and Nov. 11th.

Terms, Five Guineas each root.

Onehouse, Stowmarket, Suffolk.

NEW GERANIUMS, ETC.

ISAAC DAVIS, Larkfield Nursery, Wavertree, near Liverpool, begs to offer the following, being the best and most distinct of last year. Regalia, 5s.; Virginia, 3s. 6d; Lucy, 3s.; Pilot, 3s.; Ladybird, 3s.; Sanspareil, 3s. Very bushy strong healthy plants. The favour of early orders will oblige, as repotting will be required shortly. The usual discount to the Trade.

Also an unrivalled stock of the following RHODODENDRONS, an acre from 1 to 5 feet; Green Hollies, half an acre 1 to 5 feet; many thousands of all the other kinds of Evergreens. Pinuses, Fruit, and Ornamental Trees, Shrubs, Roses, &c.; and a good collection of Greenhouse Plants in flower. An inspection of the above will convince any person desirous of purchasing, that they cannot be surpassed in quality or cheapness. Trees are not cheap at any price unless well grown.

T. PERKINS, Atherstone, Warwickshire, begs to offer to the Trade, strong GRAPE VINES from single eyes, of the following kinds, at 12s. per dozen. Samples sent on receipt of 24 postage stamps.

Chassel's Musque	Pitmaston White Cluster
Black Hamburg	Dutch Sweet Water
Groves End Sweet Water	Black Frontignac
Grizzle Frontignac	White do.
White Muscat	Black Prince
Muscat of Alexandria	Black St. Peter

Post Office Orders payable at Atherstone.

CORN MARKET, WISBEACH, CAMBRIDGESHIRE.

CHARLES SHARPE begs to call the attention of the nobility, gentry, and trade to the undermentioned choice collection of SEED POTATOES. The undermentioned prices include hampers and package. Smaller quantities can be had if required. The Trade Price can be had on application.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. To be had genuine of THORNHILL and DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol. Price per cwt., 15s., bags included.

Also genuine Early ASH-LEAVED KIDNEYS, per bush. ... 8s.
PRINCE REGENTS (Scotch seed), per bush... ... ... 6s.

Prepayment required from unknown correspondents. A Descriptive Circular of the above will be forwarded on application, for one stamp.

FIVE HUNDRED BUSHELS OF POTATOES TO THE ACRE.—This enormous crop was grown this year by a gentleman in Surrey, and out of which there were only 5 bushels diseased; nearly all the quantity were large sized, some weighing 2 lbs. and 1 oz., and not above 30 bushels of Chats out of the whole. This Potato was originally reared in Scotland, and is called by its grower the Scottish Champion. It is a good baker and boiler. Price 2l. 2s., inclusive of the sack of 3 bushels, delivered free at the South Western Railway station in London. Early application is necessary, as only a few sacks are for sale, the party growing intending to plant largely next season. A reference as to the quantity and quality can be given in the neighbourhood.—Apply by letter, post-paid, to E. S., 4, Crooked Lane, London Bridge.

All orders must be accompanied by a remittance.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 18, 1854.

THE late continued dry weather and its attendant mildew have notoriously affected the Turnip crop to a very serious degree. But it is not only in the mildewed crops that unsound Turnips abound; perhaps even to a greater extent the white Turnips of our fields and gardens, which are often quite free from mildew, exhibit undoubted signs of speedy decay. The first indication is, we believe, always in the vascular bundles, the walls of the reticulated vessels, which are sometimes of great beauty, exhibiting traces of that peculiar brown tint, which is the certain sign of the commencement, of those chemical changes by which living tissues and their contents pass into ulmin and allied combinations which end in their reduction into mould similar to that from whence they originated. From these vessels the incipient decomposition radiates in various directions, sometimes confined to the cell walls themselves, but often affecting their protoplasm, insomuch that a section viewed with the naked eye exhibits a dark central speck with a pale and often neatly defined border. The surrounding tissue in different cases assumes a variety of appearances. Sometimes the cells are excited into repeated multiplication, insomuch that they present on their walls numerous closely set parallel lines; sometimes a few only of the cells are divided, while others have the walls repeatedly plicate, so as to make it a very difficult task to ascertain the real nature of the phenomenon. It is apparently in very early stages only of the disease that the reproductive powers of the cells are preternaturally excited, possibly from the action of some incipient change in the nitrogenous matters which they contain; and as the decomposition is clearly traceable downwards, it is highly probable that the disease is caused by noxious matter contained in the air and passing downwards through the vessels.

If the evil arose from the absorption of juices arising from the decomposition of the cellular tissue of the leaves, whether induced by external or internal causes, it is scarcely probable that it would travel downwards by one set of tubes. It is not, however, denied that noxious gases may be produced by decay in the subcutaneous tissues of the leaves, and from thence penetrate into the vessels; but fading and decaying leaves which have performed their assigned functions, and only perish from mere natural exhaustion, are so universal on plants which in every other part exhibit the most perfect health, that we must look to some less general circumstance, and this may very possibly exist in some condition of the air, injurious to some particular vegetable production, analogous to that by which epidemic disorders are produced from time to time in man, without our being able to assign the peculiar qualities which produce any particular infection. The case before us is not a solitary instance of diseased matter travelling down the vascular bundles, and the fact is well worth more extended study than it has at present received. *M. J. B.*

WE have just received through Messrs. Low and Co., from M. JACOB MAKOY, of Liége, some trusses of fruit of a NEW STRAWBERRY, called the *Délices d'Automne*, produced in the open ground, and we think so highly of the variety as to judge it worthy very special notice.

It is said to have been raised from a kind of Alpine without runners, known among the French by the name of the *Perpetuelle rouge, sans coulans*, crossed with the *British Queen*. Its scapes are tall, somewhat hairy, but much less so than those of the British Queen. Its fruit is most abundant, middle-sized, ovate, red, with the grains prominent, or but slightly embedded; the calyx is rather small. The flesh is solid throughout, juicy, and as rich as that of the male parent, but more acid. The truss has more of the habit of growth of the Alpine varieties of Strawberry than of the British Queen.

M. MAKOY states that he saw, on the 6th of November, old plants of the above, in the open ground, as much covered with flowers and fruit as if it had been the month of June, although the weather had been previously very cold. In September and October the fruit was much better, larger, and more coloured. The plants, though very productive in fruit, are said to make but few runners, as might have been anticipated from the nature of the mother of the Strawberry.

There is no doubt that we have in this case an entirely new variety, with new habits, and of sterling merit. The fruit which reached us wanted colour, and was scarcely ripe; nevertheless, it contained abundant evidence that it possesses quality of the highest order. That it should have been acid was inevitable in the case of fruit ripened in the open air in the month of November.

A very fine dish of *Prince of Wales* Strawberries was exhibited to the Horticultural Society a fortnight ago, beautifully coloured; but we apprehend they would have had no chance with this new Belgian variety, had Mr. INGRAM had it under his care.

We believe there is no record of the Alpine having been previously employed as a breeder. Now, that M. MAKOY has shown the way, we dare say many other growers will endeavour to imitate his example: and it would not at all surprise us to see that fruit like the British Queen and Keens' Seedling were as common in October as in July.

IT is now some years since ELLIOT described, in his "Sketch of the Botany of South Carolina and Georgia," certain icy fibres which appeared day by day on the stems of Pluchea bifrons, D. C. About nine years later, Sir JOHN HERSCHEL published a notice of a remarkable disposition of ice round the decaying stems of vegetables; and more recently DANA and LE CONTE have described a remarkable exudation of ice from the stems of vegetables, which the latter has illustrated by the occasional protrusion of icy columns from certain kinds of earth during frost. Dr. CASPARY had an opportunity of studying a similar phenomenon in the botanic garden at Schöneberg, in the course of last November; and, after a careful study of all the attendant circumstances, he has lately given the result of his observations at considerable length in the "Botanische Zeitung," Sept. 22, 1854. Notwithstanding some little discrepancies, there is no doubt that the several cases are substantially the same, though modified by particular circumstances. The matter is so interesting that a brief notice cannot fail to be acceptable to many of our readers; first of the phenomenon itself, and then of the causes from which it seems to be derived.

On the morning of the 14th of November several

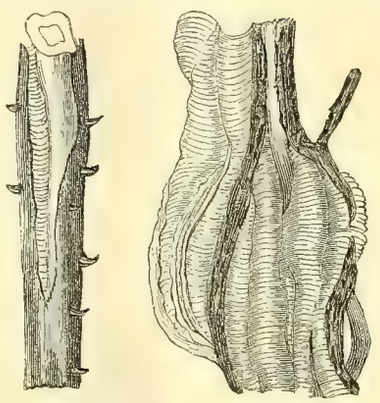
plants,* both annual and perennial, all of them cultivated in the open ground, and in full health and vigour the previous day, presented a very extraordinary appearance. The bark was variously split and separated from the wood, from which two kinds of icy formations of considerable size projected, the one consisting of fibrous strata, the other of thin vertical sheets. These were not confined to the base of the stems but extended even to the highest and thinnest branches, some of which were 3 feet or more above the surface of the soil. The first species consists of small thin horizontal threads, perpendicular to the stem, closely pressed to each other but not separable, so as to form a continuous layer 1½—4 m m. (,059—, 157 inch) thick, and from 30—90 m m. (1,18—3,54 inch) long, occupying from ⅓ to ⅔ of the whole woody cylinder. The second, which was extremely beautiful, and far more common, exhibited vertical sheets from 10—160 m m. (,39—6,29 inch) long by 10—30 (,39—1,18 inch) broad, and as thick as strong paper, springing in a radiating direction from the whole or part of the stem, sometimes to the number of 30, more or less irregularly curled and undulated, with the margin entire or minutely crenate, of a pure snow-white, or clear as crystal, and resembling some richly lamellated coral.

The plates themselves were marked with horizontal lines, as though the whole were formed of laterally confluent fibres, which sometimes projected, especially in the smaller upper twigs, in the form of a beautiful fringe. The wood itself was often split, but the plates never projected from the fissures, but originated on the exposed surface of the wood itself. The phenomenon was strictly confined to exotic species cultivated in the open ground, and consequently with their roots well developed and capable of imbibing large quantities of fluid without intermission. It occurred, moreover, on the first night that the temperature of the air and surface of the ground descended, except as a transient minimum, in a marked degree below the freezing point, and that accompanied by a strong dry wind, which must have been very favourable to evaporation. The accompanying illustration represents a small portion of a branch with either kind of formation, the prickly twig of Lantana aculeata exhibiting the first species, while the second is a Cuphea cordata.

This curious formation admits of more than one explanation. Le Conte regards it as a purely physical phenomenon, while Dr. Caspary, neglecting Herschel's view, leaves it uncertain whether the ice arises from the plant itself, or from the comparatively warm earth beneath, the evaporation from which is conveyed upwards by the plant, as by a kind of chimney. Le Conte considers the lamellar formation on the plants of the same nature with the pillars of ice, consisting of innumerable thread-like spun glass, which sometimes spring from the surface of the soil, arising from the innumerable capillary tubes which are contained in its substance. These masses occur only on the surface of the soil, which itself remains unfrozen. Supposing, then, a loose and warm soil to be saturated with moisture and exposed to moderate frost, since the soil is a bad conductor of heat, the uppermost stratum alone would be cooled down to the freezing point: and since the resistance to lateral expansion is less on the surface than it is lower down, the first effect of cold will be to make the ends of the capillary tubes or pores conical or pyramidal. The sudden chilling of the surface-water produces a rapid and forcible expansion, which, in consequence of the resistance offered by the sides of the cones, not merely pushes the thready pillar of ice forwards, but also causes it to protrude in the direction of least resistance, namely, perpendicular to the surface. The conical extremities thus become free, fresh fluid follows by capillary attraction from behind, the formation and protrusion of ice is again effected, and the same process is repeated by paroxysms till a mass is formed 3 inches or more in length. "Now if this be compared," says Le Conte, "with what takes place in the Pluchea, similar conditions will be found to exist. The porous pith supplies a constant flow of warm fluid from the soil, while the cuneiform medullary rays present the mechanical conditions necessary for the exercise of a protrusive power in the required direction."

It is not true that the moisture does ascend by the pith; but making the necessary corrections, it is easy to understand that masses of ice might be formed in this way on the plant by causes similar to those which exist in the soil. Our limits prevent our examining other parts of Le Conte's explanation, or pointing out the errors which seem to be involved in it. But allowing that this is sufficient to account for the formation of the compact fibrous masses of Lantana, it does not apply to the lamellar sheets which surround the stems of other plants. Dr. Caspary therefore inquires what organs there are in plants disposed with sufficient regularity and of proper length to give rise to plates extending sometimes several inches down the stem, and thrusting off the bark in every direction.

The only organs answerable to this character are the vascular bundles, and to these therefore his attention has been turned. In all the instances which came under his observation he found the walls of the vessels pitted, and the only difficulty of great consequence which met him was the uncertainty that exists as to the functions of the vessels. That they contain fluid at an early stage is certain, because they are but modifications of cells; but whether they carry fluid when arrived at maturity, except with rare exceptions, is far from certain. Allowing that they were gorged with fluid, in the plants in question, the lateral pores might readily convey it to the neighbouring elongated tissue, and so be subjected to the freezing temperature which had penetrated through the bark. It seems, however, to us quite as probable that the fluid might be more energetically carried through the cells with which the vascular bundles are surrounded than through the neighbouring tissue; and if so we have a series of lines corresponding with the vessels, where the icy plates might be formed,



without assuming the doubtful position that water is carried through vessels which seem more peculiarly destined to convey air, with rapidity and abundance sufficient to produce the enormous masses of ice which appear upon the stems—masses which have a very high ratio to the quantity of water which could pass through the plant within the time of the formation of the ice, under any ordinary circumstances. *M. J. B.*

VEGETABLE PATHOLOGY.—No. XLVI.

203. The Causes of Disease; *a. Internal or Constitutional.* — The objects of cultivation consist of numerous vegetable species, more or less permanent varieties of these, temporary variations and intermediate hybrids, of which the parents are distinct species or other modifications of the vegetable kingdom; all these, again, are made up of innumerable individuals, each possessed of its own peculiar qualities, whether good or bad. Now, assuming species, as such, to have been created without any especial tendency to disease, which we may fairly do, as any universal evil tendency would be sure to end in the total destruction or disappearance of any given species, the same cannot be said of the individuals of which that species is composed, much less of the various modifications which arise from cultivation, accidental conditions of climate, or hybridisation. It is notorious that many hybrids are so delicate in point of constitution that they can scarcely be kept alive for a few months, much less arrive at maturity, and individuals from the moment of germination are so utterly devoid of strength that the tenderest and most judicious nursing will not avail to raise them. The same reasoning holds good in the vegetable as in the animal world, that all defects of constitution will sooner or later appear in the offspring, and that injudicious crossing leads, of necessity, to a weakly and bad progeny.

204. Whatever evil qualities may exist in any particular individual, those qualities are handed down to the remotest descendant, so long as propagation takes place by division of one original stock; the ultimate divisions, unless new influences are called into exercise, will neither be more nor less diseased than the first; and it is obviously mere theory or blind conjecture which asserts that plants are impaired by constant reproduction from division. The case, however, is as clearly different where any particular individual has acquired constitutional disease from whatsoever cause, because in that case, if propagation be made from it, the divisions will partake of its own peculiarities, which may either be amended by cultivation, or further aggravated. The notion of wearing out, which prevailed a few years back, is now pretty well exploded, since it has been clearly ascertained that seedling Potatoes are often quite as strongly diseased as those raised immediately from sets. New races, both amongst animals and vegetables, often expel, and sometimes entirely destroy the old, though not from any weakness of constitution, but from the pressure of external natural laws which they are unable to resist; and the same applies still more strongly to new physical conditions altogether inconsistent with the maintenance of species, as where land is drained to such an extent as in a year or two to destroy every trace of the former vegetation, which required constant moisture.

205. The case is not precisely the same where plants are propagated by grafting or inoculation on a strange stock. It is well known that particular varieties require particular stocks, and though they are luxuriant, or even rampant, on a favourable matrix, they cannot be preserved except for a short time on any other. Sometimes, in order to insure success, even double grafting is needful. If, then, those varieties of fruits which years ago formed the staple of our markets, either do not exist in the present day, or only in such an unhealthy state as to render them unprofitable objects of cultivation, it does not follow that this arises from any natural wearing out of the variety, but far more probably from some difference of treatment or unsuitable stocks. The Golden Pippin is often cited as an instance; but like other productions of superior quality, it appears to be in itself delicate and nice as to the soil it affects, even if it be worked upon a congenial stock. In some gardens it is still produced in great perfection, and succeeds very well from grafts if they be judiciously selected. Larger though closely allied varieties have, however, in great measure superseded the old Golden Pippin, insomuch that the old trees were long neglected and suffered to run into decay. Practical considerations combined with love of novelty have concurred to displace many old favourites; the great reason, for instance, why the Nonpareil is not so largely cultivated as formerly is the absolute necessity of leaving the fruit upon the tree to November,* if it is to arrive at perfection. Something of the same kind may be said in all probability some years hence of the finest variety of Apricot now in cultivation. The Moor Park in many situations will scarcely live a dozen years; and were it not for the superior size and flavour, few in those localities would continue to cultivate so precarious a variety. A hundred years hence the same complaints of wearing out will probably be made of it as of the Golden Pippin, whereas the truth would be, that from its first origination, the good and evil qualities of the variety were combined.

206. Where propagation takes place by grafting, not only may the stock be unsuitable, but the scions existing in some particular district may all come from some cankered tree, which from the very nature of the case can scarcely be expected to produce healthy shoots, and a diseased condition may thus prevail in that variety through a whole district. We have seen no evidence which has at all satisfied us as to the wearing out of species. Unfavourable circumstances may have induced disease; and if the variety has accidentally been reduced by neglect or other cause, to a small number of individuals, the peculiar good qualities may never be completely restored. *M. J. B.*

PLANTING THE PEAR TREE.

Choice of Soil, Season, and Precautions necessary to ensure Success.—In a deep light soil, composed of alluvial layers, or in soils that are stony, schistose, calcareous mixed with humus, marly, or marly clay, and where the subsoil does not retain stagnant water during a great part of the winter, the Pear tree on the Pear stock may be successfully planted. If the plantation can be made in such kinds of soil, and in situations inclined to the east, south, or west, on the side of a hill or slope, so much the better. The more light, stony, or calcareous the soil, the less a sloping situation is necessary; but the more compact, strong, or schistose the soil on the sides of hills, the better the Pear tree grows and bears. It is only necessary for an attentive observer to travel in the months of August and September, through a country where the Pear is generally cultivated, and he will find the above remarks strictly correct.

If perfect success is aimed at, we ought never to plant Pear trees in ground previously occupied by fruit trees, and which have perished from old age or decrepitude.

When an old plantation of fruit trees is to be renewed, it is necessary to remove all the old roots, trench the ground, and crop it with vegetables for at least ten years. When a regular plantation of fruit trees is to be made, it is far preferable to choose a virgin soil, where, in the memory of man, no fruit trees of any kind have been grown or planted. In support of this opinion, we could state many facts which have come under our observation; but the details would prove tedious to the reader.

With regard to the season for planting the Pear tree worked on the Pear stock, and under the conditions of soil and situation above indicated, it coincides with the fall of the leaves, or a little after, say from the 15th of November to the 15th of December. In a strong and rather moist soil the planting may be performed after winter, and as late as the middle of March, but we prefer planting before winter.

In light soils, plantations made immediately after the

* Perilla arguta, Benth.; Tagetes bonariensis, P.; Alonsoa incisifolia, R. and P.; Cuphea pubiflora, Benth.; cordata, R. and P.; platycentra, Benth.; Heliotropium peruvianum, L.; Manulea oppositifolia, Vent.; Lantana abyssinica, Otto and Diet.; aculeata, L.; Calceolaria perfoliata, L.

* As healthy trees are still to be found in some districts of this superior variety as ever, and bearing as clear, large, and ruddy fruit, but it is not a kind which will repay the cultivator, except he has a ready means of disposing of the finer kinds of fruit at a proportionate increase of price, and so it is but little cultivated by small gardeners.

fall of the leaves, in the month of November, before hard frost sets in, are always the best. In order that the trees may suffer as little as possible from removal, their roots should not be allowed to dry by exposure to the air. After being taken up they should be immediately packed in damp moss. When the trees arrive at the place where they are to be planted, all bruised fibres should be cut off, and the larger roots that may have been broken in taking up should be cut with a sharp knife, commencing a little from the ends on the under side, and sloping upwards. For a tree two or three years budded the holes should be made 3 feet wide, and 2½ feet deep. If the soil be strong and compact, the holes may be proportionally wider and deeper. It is always advisable to put in the bottom of the hole a layer of good light rich earth taken from the surface of a kitchen garden; and the roots should be covered with some of the same sort of soil. If the trees have been out of the ground for a week or two, owing to some accident, and if the roots are consequently in a dry state, they should be steeped for two hours at least in rain or pond water. In light soil, and in dry weather in spring, it is usual to water the soil well about the roots before these are finally covered. This is done in order to close in the dry light soil about the roots. This watering below the surface layer of soil facilitates the emission of roots, and thereby insures the starting of the tree.

When a tree is planted in a hole, dug at least five or six days previously, it ought to be so placed as to have its upper roots about 2 inches above the level of the ground. The newly stirred soil in the bottom of the hole will gradually settle, so that the upper roots will ultimately be as low as the surface of the soil. In planting the tree, it is improper to shake or lift it up, for thereby the roots may be imperceptibly broken or twisted. After planting it is advisable to lay a good thickness of light soil over the roots, in order to support the tree against the strong winter winds, and to protect the roots from severe frosts which may occur. After the tree has taken root, this extra layer of soil should be levelled off, in order that the solar rays may exert their beneficial influence on the soil in contact with the upper roots. Trees planted with these precautions succeed the best. Any one may observe that fruit trees which emit roots from the neck of the stem, immediately below the surface of the soil, are more vigorous and bear fruit in greater abundance and of better quality than those that are planted too deep, which on the contrary languish and continue unproductive, although planted under the same circumstances of soil and situation as the preceding.

There is another important point which we cannot pass over in silence. It is the bad practice of pruning or mutilating the tree before planting. This practice is not in any respect a rational one. How, indeed, can it be expected, that a young tree can take well after suffering from transplanting and a change of soil; whilst at the same time it is subjected to amputations which, under the circumstances, it is impossible to heal? Strictly speaking, the branches of a transplanted tree ought not to be pruned till it has taken root, till the buds have pushed by the first flow of sap, or rather after the second, in August or September; as we have already pointed out, on principles which we believe to have established in the article relating to the pruning of Pear trees on Pear stocks, and cultivated as dwarfs and as pyramids. *J. De Jonghe, Brussels, Nov.* 10.

ÆCHMEA FULGENS.

The unusual length of time during which this Æchmea lasts in beauty renders it one of the most useful plants at present in cultivation. It is extremely suitable for flowering in small pots for furnishing vases in rooms; and being a somewhat striking plant, and capable of bearing the confinement of a close apartment for a considerable time without much injury, it is an excellent subject for house decoration.

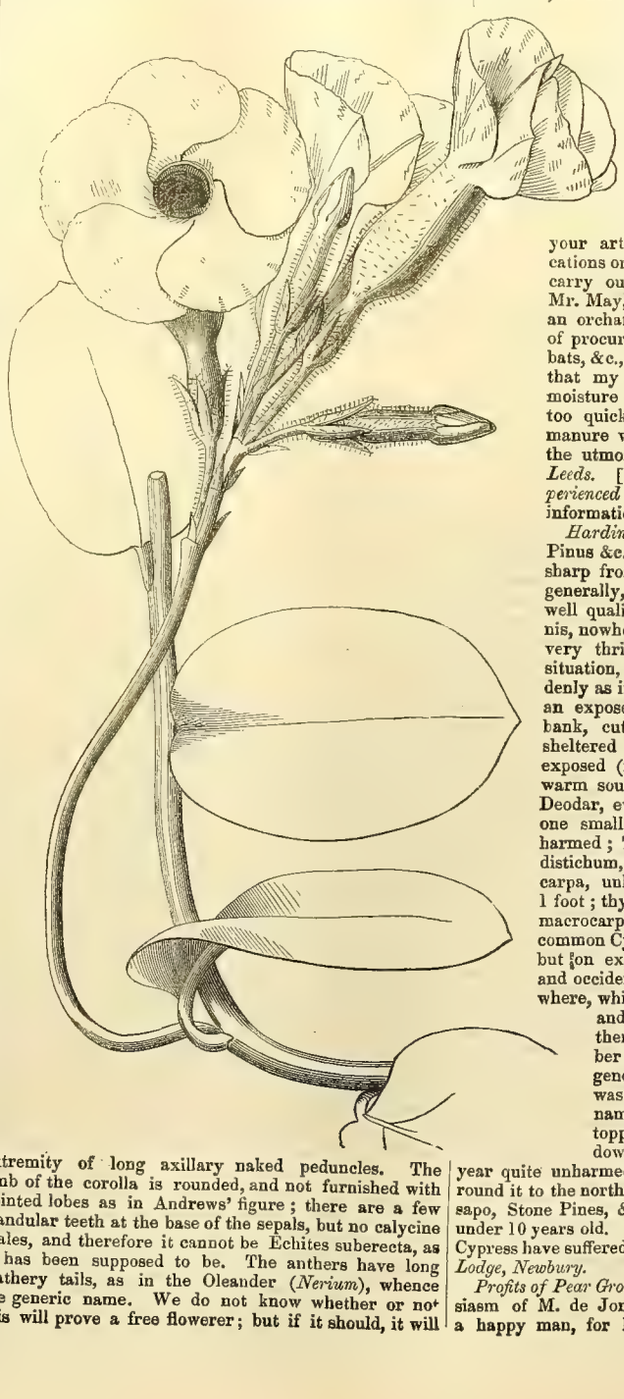
Plants intended to form large specimens should be grown on freely the first season, getting the suckers potted early in spring, putting three in a 7-inch pot, and keeping them growing as late in autumn as can be done without drawing or weakening the foliage, and affording them sufficient pot room, with plenty of heat and moisture. In winter give no more water to the soil than will suffice to prevent it from getting unhealthily dry, and let the plants occupy a cool light part of the stove, in order to check and mature their growth, and ensure their blooming. After allowing them six weeks' or two months' rest, they may be placed in bottom-heat, giving the soil sufficient water to properly moisten it, and they will soon be in full beauty. But it will not be advisable to remove them to a cool house while in flower, as this would prevent their making any growth while in that state, and the inflorescence lasts so long in beauty, that this would be a considerable hindrance, where large specimens are wanted without loss of time. In this case, therefore, it will be better to let the plants remain in the stove, placing them where they can be spared from the syringe, and as much out of the way of damp as possible. When the flowering of the plant is over, cut out the spikes, and remove any of the leaves that may be interfering with the young suckers, but do not cut down the shoots that have flowered until this becomes necessary to prevent crowding the suckers. The plants should now be repotted, placing them in a warm part of the stove, and in bottom-heat if convenient, and encouraged by plenty of heat and moisture to make vigorous growth. Thin out the young suckers to the proper number for forming a specimen of the desired size, and let this be done before those to be left are injured by crowding, and the old pieces should also be removed in time to prevent injury from them. As to the number of suckers proper to be left, this will depend upon the size of pot, &c., but it is better not to leave too many, as fine strong flower-spikes will not be produced unless the plants are kept moderately thin, and grown strong. If all the shoots on a large plant are expected to bloom at once, the specimen must be subjected to a short period of dry cool treatment, to check and mature the growth; but if a succession of bloom is wanted this will be best secured by keeping the plants in growing circumstances to secure a succession of suckers. Treated in this way they will grow and bloom, and furnish a succession of flower-spikes the year round, and will be attractive objects. I am not partial, however, to the system of growing this plant in large masses, for well-grown single plants are, in my estimation, by far the most attractive. Any light rich soil, through which water will pass freely, will be quite suitable for potting, but care should be used to secure perfect drainage, for the roots are impatient of stagnant moisture, which also injures the foliage. *Alpha.*

New Plants.

101. Neriandra suberecta *Alph. Decand. Prodr.*, viii., 422; *aliàs* Echites suberecta, *Bot. Rep.*, *t.* 187; *aliàs* Echites Pellieri, *French Gardens.*

This was sold to Mr. Glendinning, of the Nursery, Turnham Green, by M. Miellez, of Esquermes, near Lille, as a *new* Echites called Pellieri, after the Messrs. Pellier of Mans. A little inquiry among French botanists would have rendered it unnecessary for these gentlemen to deceive themselves; for they would have learnt that the plant had been figured more than 50 years since in Andrews' "Botanists' Repository," an English work, the plant having then flowered with Messrs. Lee and Kennedy.

It forms a graceful twiner, with firm oblong shining leaves, and clusters of lemon-coloured flowers at the extremity of long axillary naked peduncles. The limb of the corolla is rounded, and not furnished with pointed lobes as in Andrews' figure; there are a few glandular teeth at the base of the sepals, but no calycine scales, and therefore it cannot be Echites suberecta, as it has been supposed to be. The anthers have long feathery tails, as in the Oleander (*Nerium*), whence the generic name. We do not know whether or not this will prove a free flowerer; but if it should, it will rank horticulturally with Dipladenias. Mr. Glendinning informs us that he finds it difficult to propagate. The plant seems to have been originally obtained from St. Vincent's.



Home Correspondence.

The Pampas Grass.— While stationed in the year 1846 off the the Island of Vizcaino, in the river Uruguay, our attention was drawn to a weed which seems to answer the description of the Gynerium argenteum, in your paper of the 4th inst. I regret that I can give no particulars as to its leaves; the height of the flower-stem was about 10 feet, and to the best of my recollection the plume of flowers was more feathery than your figure represents them to be. These islands are situated at the junction of the Uruguay and the Rio Negro; their character is generally swampy, and along the water's edge is invariably a thick fringe of bush, at the back of which I saw specimens of the feather reed growing. The numerous small craft trading to the Rio Negro are in the habit of cutting quantities of Orchidaceous plants for sale at Monte Video, and I have seen them ornamented with the feathery plume in question. There would therefore be no difficulty to a resident at the latter place in procuring as much as he pleased of it. *H.K.*

Forming an Orchard on thin Soil on Gravel.—I shall be much obliged to you if you will give me the benefit of your advice on the following point. I am going to plant an orchard for Apples, Pears, Plums, Cherries, &c. The soil consists of a very few inches (about 5) of good earth, the subsoil being gravel (round pebbles and sand) to an immense depth. My gardener says that if the whole were taken out to the depth of 3 feet, and refilled with 1 foot of stiff clay, of which there is abundance not far off, and the remaining 2 feet with loam, leaf mould, manure, &c., he has no doubt the result would be satisfactory. The expense is immaterial, provided the object be gained. Be so kind as to inform me whether you approve of his suggestion; if it would be likely to remain a permanent improvement, or whether, as has been mentioned to me, the clay would no longer remain clay, but become so assimilated to the gravel in ten or a dozen years as to let the moisture through as quickly as the gravel does now. What fruit trees do well on gravelly subsoil, and what on clayey? And finally, what would be the best thing to do to ensure a productive orchard under the circumstances (as far as preparing the land goes) expense being, as I have stated, no object? I have read with much pleasure your articles and correspondents' communications on Pears; but I do not see how I could carry out the advice of your correspondent, Mr. May, (pp. 725 c, and 726 a), in planting an orchard of 2 acres, from the impossibility of procuring the enormous quantity of brick-bats, &c., which he requires. You will observe that my gardeners' object is to retain the moisture and prevent it from going through too quickly, which it now does, carrying all manure with it. Mr. May's object is to give the utmost possible amount of drainage. *Beta, Leeds.* [We have no doubt that some *experienced* correspondent will readily furnish the information here asked for.]

Hardiness of Conifers, &c.—Here is a list of Pinus &c., and how they were treated by the sharp frost this spring on my land, which generally, you must know is a light sandy loam well qualified for most of the tribe:—P. insignis, nowhere affected in the least; excelsa, one very thriving one was quite killed in a low situation, but on dry ground, scorched up suddenly as if struck by lightning; Webbiana, in an exposed place, untouched on a dry south bank, cut down; Lambertiana, in a damp sheltered corner, untouched; Khutrow, in an exposed (moderately) situation, killed, in a warm south-looking bank not materially hurt; Deodar, everywhere cut down very badly, but one small tree on a wet north bank is unharmed; Taxodium sempervirens, untouched; distichum, cut down slightly; Cupressus macrocarpa, unharmed; torulosa, cut down about 1 foot; thyoides, unharmed; both thyoides and macrocarpa are on a warm south bank; the common Cypress terribly cut down everywhere, but on exposed ground; Platanus orientalis and occidentalis are neither of them hurt anywhere, which I am much surprised at. Walnuts, and Spanish Chestnuts, planted with them, sadly mutilated. There is a number of trees, both Coniferæ and others, generally unharmed; but my attention was specially directed to those I have named above. Several Silver Firs were topped, and a Cork tree, which was cut down last year by a slight frost, is this year quite unharmed, having had a slight shelter put round it to the north and east during the spring. Pinsapo, Stone Pines, &c., unharmed; all these trees are under 10 years old. The Deodaras and common upright Cypress have suffered most of any. *R. H. Valpy, Enborne Lodge, Newbury.*

Profits of Pear Growing.—I admire the amiable enthusiasm of M. de Jonghe; he must be pre-eminently a happy man, for he imagines that he can by his

"scientific mode of pruning" defy nature and all the frosts and storms of our northern climate; a man with such an opinion of his own powers must be very happy. I now write to put in a word in defence of the poor abused Pear trees in the neighbourhood of London. According to M. de J. they are effete and exhausted, owing to bad management. Now, that he is entirely wrong I can testify, and when he pays his annual visit to England next summer, I hope he will allow me to be his guide to the Pear gardens in the neighbourhood of Rotherhithe and New Cross; he will there see finer and more fruitful Pear trees than can be found in any part of Belgium, and large standards, healthy, free from canker, and full of fruit-bearing spurs, of such sorts as are rarely seen bearing well as standards—I mean Brown Beurré (Beurré Gris of Belgium), Crassane, and Jargonelle. These trees bear annually, with the exception of such extreme frosty springs as those of 1853 and 1854, immense crops of fine fruit; and I firmly believe that more Pears are grown in this district than in all Belgium. Some years ago, when the Greenwich railway was carried through the Pear gardens of Rotherhithe, one of the growers was found to have made 20,000*l.* by Pear growing; and this was done without the aid of M. de Jonghe's system of pruning, but simply by a good climate, good soil, and the usual thinning out of the branches when crowded. I do not state this to disparage pinching and pruning, which is so necessary with pyramidal and espalier Pear trees, but merely to point out to M. de Jonghe that it is necessary to look well into a country before an opinion is formed of its resources. I hope our Pear trees will be stirred up by the reproaches cast upon them, and that next year their smiling abundant crops will enable us to laugh at the evil prognostications of our happy friend. *Thomas Rivers.*

The New Water Weed.—I am sorry to destroy the expectations of your correspondent "J. B. G.," and sincerely wish he were correct. The Anacharis alsinastrum is fearfully increasing in the Trent; and on the canals at Burton-upon-Trent. The swans have been encouraged and driven to its locality, but they seem to avoid, and have lately deserted it. I do not think they eat it when under their feet. *J. L., Burton.*——With reference to the destructive propensities of swans, as directed against the Anacharis alsinastrum, if you will refer to the *Gardeners' Chronicle* of 10 or 11 years back, you will find a similar fact registered by myself, which though it brought me into some little ridicule at the time was still a fact for all that. I believe, however, that these birds destroy as many weeds in swimming about and pulling them up as they do in eating them, and it is quite certain that almost everything less strong than Iris Pseud acorus must soon perish under their incessant cropping. About four years back we tried to keep the swans from the water immediately contiguous to the lawn, but the weeds spread rapidly, and we were glad to avail ourselves again of their assistance. Another season, weeds being scarce, the swans attacked a remarkably strong plant, a dense mass several yards through, of Nymphæa alba, and in one night they destroyed almost every leaf, leaving merely the stems and midrib. Such small weeds as the Anacharis will stand no chance with a few swans, and are sure to be exterminated, and a few geese and ducks will not be found unworthy assistants in the work of destruction. *Wm. P. Ayres.*

Protecting Wall Trees in Spring.—The question of protection to wall trees is now more than ever important to gardeners. Allow me, therefore, to ask, with reference to the woodcut in your paper of the 28th October last, of what sized mesh is the woollen net? Unless very large indeed, it certainly does appear, that what with the net and the calico, the trees can scarcely get any light. How, then, is a healthy vegetation to be carried on for two months and a half at the very least? However, as it seems to have been tried and succeeded in one place, it may probably do so in others. *J. B.* [We do not recollect the width of the meshes; but we *know* that your apprehension is groundless.]

The Fir Beetle.—The Scotch Fir of this place (a tree of remarkably fine growth, and of so peculiar a habit as to be noted as distinct from those of its own species in the neighbouring districts) has suffered in several seasons in a curious manner. About the middle of autumn I have found the ground beneath these trees strewn with the young shoots of the spring, so fresh in appearance as at first to suggest the idea that they were nipped off wholesale by the squirrels. But on examining these shoots, splitting them as you will perceive in the specimen I enclose, I discover the whole of the wood to be eaten out by the little insect I have detected at the end of the bore, and which I endeavour also to transmit to you. I hope that you or some of your correspondents will have the kindness to let me know what is to be done with this enemy. *F. G. M.* [Your tree is attacked by Hylurgus piniperda, the great enemy of Fir trees. We believe the best way of dealing with the insect is to break the young shoots off the tree as soon as they begin to droop, in consequence of his attack, and to burn them. The beetle lives on the pith, but places her eggs under the ragged bark of any neighbouring Fir tree.]

Sarracenias.—The culture of the Sarracenia, or American Pitcher-plant, is by some considered difficult, but the principal if not the only reason why these plants are not more frequently to be met with, is more to be attributed to the small share of practical attention they have hitherto received than to the uncultivable nature of the plants themselves. It is a mistake to imagine that any temperature, however genial, will induce the roots of Sarracenias to penetrate, like those of Heaths, such a solid compost as peat and sand, or that the plants will grow or even live treated like aquatics, and submerged in a hothouse tank. Early in March they should be potted into 5-inch pots, using for composts turfy lumps of peat, sphagnum, and potsherds in equal parts. Care must be taken to keep the crowns well up from the soil. The pots should be placed on the platform in a shady part of the stove. As soon as the plants begin to start each pot should be surmounted with a bell-glass; glasses with an aperture in the top would free the plants from the presence of too much moisture, otherwise the plants will suffer from damp; and as in nine cases out of ten Sarracenias are destroyed through damp, it will be above all things necessary that especial attention be paid to this direction. Do not place the pots in those miniature cesspools called saucers, but water the plants while growing, daily, on the surface. The object in using bell-glasses is to induce the plants to break freely, and when they are all fairly started the glasses may be gradually dispensed with. Both the foliage and the pitchers will be produced in much better colour, and grow considerably stronger without the glasses than with them. Do not darken the glass immediately over the plants; for although Sarracenias while growing delight in a humid atmosphere, they do not like it darkened. The plants should therefore have all the light possible, but no sun. Sarracenias may also be grown in the most shady part of the greenhouse or conservatory; but, in this case, the bell-glasses should not be removed until after the plants have done growing—in other respects the treatment will be the same. The situation best suited for preserving Sarracenias during winter is on a shelf, well up in the light, in the least airy part of the greenhouse; while there the plants should be sparingly watered. *R. Miles.*

Effects of Spring Frost on Apple Trees.—As an instance of the peculiarity of the past season, there are two Apple trees in my plantation with a crop of small Apples, about the size of marbles on each of them, in all about 50; also several bunches of bloom. This morning I cut off a small branch with 12 such Apples, and a bunch of bloom on it. The sorts are, I believe, the Hawthornden and Oslin Pippin. The first bloom, which was plentiful, was all cut off by spring frosts, but towards the end of summer the trees again formed flowers, many of which have set, and have produced fruit about the size above described. *H. H., Sutton at Hone, near Dartford, Kent, Nov.* 14.

Radiation.—If "S." will refer to that text-book of radiation, Dr. Wells's "Essay on Dew," he will find something of what he seems partly to know, and more ground for profitable speculation. *T. L., Burton.*

Nimrod Strawberries.—Permit me to inform your correspondent "A Lady" that the plants which produced the large fruit mentioned at p. 693 were shaken out of the pots and planted in the open ground. *J. L., Exeter.*

Societies.

Entomological, *Nov.* 4.—The President in the Chair. Amongst the donations received since the last meeting was a series of choice Scotch insects, collected by Mr. Foxcroft in his recent excursion, by whom they were presented to the Society; also various publications from the Royal Society, Society of Arts, the Boston Society of Natural History, the Smithsonian Institute, the Entomological Society of Stettin, &c. Mr. Curtis, alluding to the jumping seeds received by Sir W. Hooker, exhibited the cocoon of a species of Ichneumonidæ, which he had observed to be capable of leaping about like an India-rubber ball. It was of an oval form and banded with white round the middle, and agreed with the cocoon described by Reaumur and Kirby and Spence as possessing the same power. The ichneumon reared from the cocoon was a species of Campoplex. He also exhibited a large species of Cynips, which he believed to be new to this country, and to be identical with the C. Quercus Petioli of Linnæus, received from Mr. Wallcott, who had reared it from the gall of an Oak found at Clifton hot wells. Mr. Rich exhibited several twigs of Oak infested with these galls, which closely resemble the galls of commerce, and were found near Bristol on the Oaks in great numbers, although they had never been noticed before. They were capable of producing a strong black dye; and it was remarkable that the trees on which they were found, produced no Acorns, the galls being developed on the twigs at the expense of the latter. Mr. F. Smith and Mr. Stainton stated that they had observed them in previous years; and Mr. Westwood stated that he had recorded the occurrence of this species in the *Gardeners' Chronicle* some time since. Mr. S. Stevens exhibited Otiorhynchus septentrionis, of Herbst, a new British species of Curculionidæ, taken by Mr. Foxcroft, in Scotland. Likewise a number of very rare coleoptera from Natal collected by Mr. Plant, including Goliathus Derbyanus, a new species of Tefflus, &c. Also a species of a minute dipterous insect, Phora urbana, which was stated to have been discharged from the nostrils of a person who had been long suffering from a disease of the nostrils. Mr. Logan exhibited a new British species of Elachista named biseriatella; and Mr. Harding a new Simaëthis found on the Parietaria. Mr. Westwood mentioned that Mr. Gould had communicated to him a specimen of the common Helobia brevicollis, which he had observed to be luminous in the dark, the luminosity being probably owing to its having fed upon the Geophilus electricus, which is luminous at this season of the year. Mr. Baly read a paper containing descriptions of a number of new species of Chrysomelidæ from New Holland. A new part of the Transactions (containing four plates) was announced as ready for distribution.

Notices of Books.

Insecta Maderensia; being an Account of the Insects of the Islands of the Madeiran Group. By T. Vernon Wollaston, M.A., F.L.S. London, Van Voorst, 1854; 4to, pp. 634, with 13 coloured plates.

This is a volume of which the cultivators of natural science in this country may well be proud, and by which the famous name of Wollaston has received an increase of well-earned fame in the third generation. Other countries, it is true, have produced as elaborate and even more extensively illustrated works upon particular countries, as the results of especial voyages—such as those of D'Orbigny, and of the Astrolabe and Coquillé, or the great French works on Greece, Algiers, &c.—but these have all been published under the auspices and at the expense of the government of the countries in which they have appeared; whereas we have here a private individual devoting not only several years to the investigation of the objects described in its pages, but also giving the result of his labours to the world in a style almost unequalled in entomological works.

Having been advised from the state of his health to pass two winters in Madeira, he employed his time whilst there in collecting the insects of the island with the intention of publishing lists and descriptions of the species in some of the natural history journals; but the matter grew on his hands to an unlooked-for extent, acquiring thereby fresh interest sufficient to lead him a third time to the island, in order to complete his knowledge of its Insect Fauna during the summer months, when he was enabled to ascend the higher regions of the island, living for several weeks in a tent, and thus becoming acquainted with districts previously but imperfectly explored, as well as allowing him to pay visits to the small islands of the Deserta group in the neighbourhood.

The volume before us contains the descriptions of the Coleoptera, or beetles, collected during these several sojourns in Madeira; and from the very careful manner of collecting adopted by Mr. Wollaston, we may well believe that we have here a tolerably correct and entire view of the Coleopterous Fauna of the group of islands in question. In this point of view the volume merits especial attention, containing many important results in reference to the geographical distribution of insects, whilst the minutely careful manner in which the descriptions of the genera and species are drawn up leaves nothing to be desired.

Our author had still another object in view in the publication of this work; and we sincerely trust, and indeed cannot doubt, that his benevolent ideas will have the result which he anticipated when he states, "One of my principal designs has been, not only to afford a complete catalogue to the general naturalist of Madeiran Coleoptera, but also to put into the hands of the sojourner there for a short period (of which there are several hundreds every winter from England alone, independently of those from other countries) a full and intelligible account of the actual stations in which he will probably be able to procure the several insects acquired by this means. Indeed I am emboldened to hope that my researches may be turned to some practical account for the amusement of that unfortunate class of wanderers whose lot it is to submit year after year to an eight months' exile in Funchal; for plainly to point out one way (be it but one) in which even a few stray minds may find an ample field to sport in during a banishment, under emergencies not the most enviable, is a boon which ought not to be overlooked in dealing with a subject thus voluntarily undertaken (however small it be, and imperfectly performed) for the *general* good."

The geographical position of these islands renders their natural productions very interesting in reference to the geographical distribution of animal and vegetable life; and it is perhaps amongst the Insecta that we may expect to obtain the most important results, since whilst the species of the higher animals are too few in number to allow general results to be drawn, the insects are sufficiently numerous to enable us to derive several important facts. On this head the author observes "The intermediate situation of Madeira, which, whilst pertaining artificially to Europe, has nevertheless much in common with the north of Africa (from which in distance it is the less remote), imparts to it an interest, the importance of which the student of zoological geography cannot fail at once to recognise; and if we scan the results arrived at in the following pages, that there is positive ground for the belief that *its Coleopterous Fauna is*, in a large measure, *of a very isolated* type, although partaking, in the main, of that particular stamp which is usually acknowledged as Mediterranean, yet the number of endemic species (and even of genera) would seem to be so great, whilst the new modifications which have been brought to light are so extremely characteristic and adjusted to the nature of the country in which they are placed, that we cannot resist the conclusion, that whatever may have been the extent or condition of that ancient continent of which these several Atlantic clusters are the sure witnesses, that portion of it, at any rate, which the Madeiran may be supposed to represent, was not only singularly rich in creations adapted specially to itself, but also that the

various forms must have migrated but very slightly ere the land of passage was destroyed—seeing that many of them had apparently not even reached those points of its area which are now the detached portions of the actual group. That this is really a fact, we may appeal, *inter alia*, to such insects as the Tarphii, only a single one of which, out of 15, occurs beyond Madeira proper [we possess this genus from Sicily]; to Argutor and Trechus (of the same island); to Acalles (of which 12 members out of 13 belong to the central mass); to the aberrant Atlantides and the Anemophili (almost exclusively Porto Santan); or to Deucalion (which reigns supreme on the nearly inaccessible heights of the two southern Desertas)."

The entire number of species of Coleoptera obtained by Mr. Wollaston amounts to 483; of this, not fewer that 270 (including 41 genera) are regarded as absolute novelties, the correctness of which, the majority of the species being apparently of an endemic nature, appears reasonable. The genera in which these 483 species are arranged are 213 in number, and out of the 41 genera now first described, there is reason to believe that nine are not exclusively Madeiran, thus reducing the endemic genera to 32, not 34, as the writer states.

Some peculiarities, both in respect to the entomological wants of the island, as well as to the nature of its possessions, are pointed out by Mr. Wollaston. It is remarkable that numerous genera and even families, which are looked upon as almost universal, do not occur in these islands. There is not so much as a single species of the Cicindelideous, Buprestideous, or Pselaphideous families; whilst Carabus, Cetonia, Telephorus, Tentyria, Pimelia, and other genera are also entirely wanting. Respecting the families of which representations occur, the Curculionidæ, Staphylinidæ, and Carabidæ take the lead. Mr. Wollaston says this is as might be expected, ; but we do not agree in the existence of such a necessity, the first of these families being herbivorous and the two others carnivorous. Of the Curculionidæ there are 80 species, of Staphylinidæ 73, and of Carabidæ 63. If the general character of the Fauna of the island indicated a pre-eminently herbivorous type, we might then, indeed, reasonably have expected the Curculionidæ to have been a predominant group; but, as we have seen, not only are the Buprestidæ entirely wanting, but of Chrysomelidæ there are only 4 species, of Cerambycidæ 6, and Galerucidæ 13. There must then be some strange peculiarity in the constitution of these islands to allow the Curculionidæ to take the foremost range in point of number of species. Mr. Wollaston has partially touched this question in his observation that two of the principal features observable throughout the Coleoptera of these islands are the *general obscureness* of *colouring* (gay tints being exceedingly rare), and the *apterous tendency*. Now, these two characteristics appear to us to indicate that there is a great want of connection between the insects and plants of these islands. Out of the 482 species of beetles, not fewer than 178 are unable to fly; but insects which feed on the leaves of trees and shrubs are almost invariably necessarily furnished with wings; and hence it is that in the great American forests we have such an infinite majority of Chrysomelidæ and Cerambycidæ, and also why in the latter country especially nature has expended her richest stores of colours. This, and other questions of similar character are discussed by Mr. Wollaston at considerable length, whilst the very careful descriptions both of the new and old genera and species will render this volume a most valuable aid to future entomologists. We have only to add a remark that the price at which the volume is published is so small as to insure a very extensive pecuniary loss to the author. *J. O. W.*

Garden Memoranda.

J. Simpson's, Esq., the Water-Works, Thames Bank, Pimlico.—The beautiful collection of Pompone Chrysanthemums which this place contains is now in full bloom, and a magnificent display it makes. A whole greenhouse, as well as portions of other houses, is filled almost entirely with well grown plants of these small flowered kinds, intermixed here and there with a few specimens of the earlier flowering of the large varieties. In addition to their fine heads of bloom, the distinguishing characteristic of Mr. Robinson's plants is their dwarfness, many of them being not more than a foot high, but considerably more than that in diameter. We have seen plants exhibited from this establishment 15 inches in height and 20 inches in width, beautifully in bloom in 8-inch pots. Indeed it would appear to be scarcely possible to carry good cultivation farther than is done here, not only in the case of Chrysanthemums, but also in that of Pelargoniums and other plants which Mr. Robinson is in the habit of growing.

The soil which Mr. Robinson thinks most suitable for the Pompone Chrysanthemum is one half rich turfy loam, one fourth horse and cow manure in equal parts well decomposed, and a small portion of silver sand. The plants are easily propagated; the second week in April is chosen for the operation. Having obtained as many thumb pots as are likely to be required, they are filled with rich light soil. The work is commenced by taking off strong healthy cuttings, placing each cutting singly in the pot. The pots are then plunged in a brisk bottom-heat, either in the propagating house or in a frame, keeping them close and frequently sprinkling them overhead with a fine-rosed watering pot; every means are employed to prevent their drooping. As soon as they are rooted air is admitted on all occasions when the weather is favourable, increasing it as the plants become established. When sufficiently rooted they are shifted into 4-inch pots and replaced in a slight bottom-heat, keeping them rather close for a week or 10 days, which promotes growth very materially. After that air is freely admitted in order to strengthen the plants which when well rooted are shifted into 5-inch pots. They are now permitted to have the full benefit of both sun and air. When well rooted round the balls they are stopped close down, *i.e.*, to within 3 inches of the soil; by this plan, short, bushy plants are secured. After they have broken afresh, they are shifted into 6-inch pots, in which they make fair-sized specimens; but if larger plants are desired, they may be obtained by shifting them into 8-inch pots, or they may be placed in that sized pot at once without being moved into 6-inch ones. After they have received their final shift, and are well established, a little weak manure water is given them twice a week, and they are plunged about half way up the pots in the ground in the open air, where they are allowed to remain until the buds are well set, and, indeed, have begun to show colour; they are then moved under glass. At this stage of their growth they are fumigated at least twice with Tobacco in order to keep green-fly off them. When these instructions are fully carried out, they open their blooms clean, vigorously, and in first-rate character. Plants well grown like the above make fine objects during the latter end of October, and all through November, and some varieties will even continue in bloom until the end of December.

Of the sorts, *i. e.* the Pompones, grown here, the most beautiful are perhaps the following:—Autumnum, brown, showy, and early; Ninon, white, tipped with blush, dwarf, and a free bloomer; Cedo Nulli, beautiful blush white, large and showy, the best of its class; Solfaterre, pale clear yellow, a free bloomer, and early; President Decaisne, purple, distinct and good; Mignonette, brown and yellow, small, but very pretty; Surprise, white, tipped with blush, nearly as early as Hendersoni, which is well known to be one of the very earliest; Argenteum, white, also an early bloomer, and good; La Vogue, yellow, with a large bronze eye, comparatively new, and very beautiful; La Gitana, delicate blush white, with a yellow centre, fine in form, and a free bloomer; Model, white, finely shaped; Asmodée, reddish brown, distinct and good; Reine d'Anemone, one of the best of its class, the petals in the centre being compact and beautifully arranged; Louise Miellez, white, with a yellow centre; Criterion, orange buff, changing to yellow in the centre, distinct and good; Rose Pompone, slightly quilled, fine in shape; Poulidetto, rosy lilac; Daphne, crimson, partly an Anemone flower, free bloomer and showy; and Jonas, yellow, with a large dark centre, distinct and pretty.

A bed of many of the above sorts has been made in the open ground, where they bloom beautifully, and are extremely gay for a long time late in autumn. They consist, in this instance, of old stools put out after the cuttings were taken off them; but cuttings planted out are stated to bloom equally well.

FLORICULTURE.

Preservation of Dahlia Roots.—Being fond of good Dahlias, and grieved at the frequent losses that come under my notice, I beg to commend to the attention of those who too often have to lament the loss of their favourites, the following effective method of preserving their roots. The tops being killed by the autumn frosts, and thus become unsightly, must be cut away, leaving the roots undisturbed for several weeks in order to feed the nascent buds destined to break the following spring. For, if at the time of removing the plants from the ground these buds are immature, there is great probability that the tubers will perish before the spring; or should their vitality remain, there will be found a difficulty, if not an impossibility of getting them to "break." The next business is to lift the plants from the ground; and in doing this the greatest care should be taken to preserve their fibrous roots, for the plants require constant nourishment. A number of these rootlets will, however, under the most careful handling be broken off, and the supply of sap interrupted until new roots are made; but with those plants that have well-swollen buds their reproduction is soon effected. When the tubers are raised from the ground they should immediately be transferred to their winter quarters, where their fibrous roots must be carefully spread upon a thin layer of sand or earth, and at once covered with about an inch of the same, leaving the greater portion of the tuber bare. During winter they should be kept slightly moistened. For wintering these tubers there is perhaps (unless an especial place is provided for them), no better place than under the stage of a cool greenhouse; but, whatever place may be assigned them it is indispensable that it admits a moderate amount of light; is kept cool, but above the freezing point, and that the atmosphere is such as suits growing plants generally; alike free from both saturation and dryness, which will with equal certainty engender putrefaction. *W.*

Chinese Primroses.—I have a fine collection of these now beautifully in bloom, and nothing could possibly be more cheerful or delightful than their appearance is at this season of the year and during winter. This common, but really pretty plant does not appear to be half so much grown as it deserves to be; the following account of my method of cultivating it may therefore be found useful to amateurs or others who have not hitherto paid much attention to it. Seeds may be sown in succession in May, June, and July, to furnish a supply throughout the winter and spring. Let them be sown in light sandy soil, and placed in a moderate hot-bed frame, or an ordinary greenhouse would do; as soon as the plants are large enough, prick off into either pots or pans as many as are required, and place them near the glass, to prevent them from becoming drawn, which at any stage of their progress would greatly injure them. As soon as they are fit, pot them singly into thumb-pots, giving increased air; when established, they may be placed in a cold frame, kept at first rather close, afterwards give more air, and shift progressively until they are in pots of the required size; 6-inch pots will generally be found large enough, except for specimen plants, which may be put into an 8 or 10-inch size. The soil must be gradually increased in strength, until it is composed of equal parts loam, peat, and leaf-mould, mixed with a little sand and fine charcoal. The pots must be carefully drained, as the plants require liberal supplies of water. They may remain in the frame until the approach of frost, and may then be removed to the greenhouse. Those of the first sowing will be in flower by the beginning of October, the second by Christmas: those of the third or July sowing should be wintered in 5-inch pots; any premature flower-stems they may show pinched out, and be finally shifted in the beginning of February. As there may be danger of the collars of the plants being affected by damp during dull weather in winter, they may occasionally be supplied with water from below. In this way, and by giving abundance of light, air, and water, handsome plants, with richly-coloured flowers, may be produced; which, mixed with a few common things, such as Cyclamen persicum, Tree Violets, Lily of the Valley, Crocuses, Snowdrops, and Winter Aconites, all of easy cultivation, would make a basket at any season fit for a drawing-room. *W. E.*

Carnations: *Woodhouse.* Owing to the fine autumn we have had these plants will be very easily wintered, compared with the trouble they have been during the last two seasons; all should be established in the small pots by this time. This being the case, and the plants healthy, their management consists in the merest routine for the next three months. Plenty of air but not much water; the hardier they are kept the better; damp must be avoided, and the plants must be kept perfectly clean.

Cinerarias: *J. D.* These plants should now be growing very fast; fumigate if aphides are detected: this should be done with care, the foliage being very tender; burning a little tobacco two successive nights will be most effectual. Those for winter flowering will now be throwing up their blooming spikes, and may be selected from the general stock in the pit, and placed in front of the greenhouse. Shift any portion of young stock that is filling the pots with roots.

Hollyhocks: *J. D.* Now is the best time for procuring cuttings of these from the crown of the root, for the reason that they strike more readily and make the best plants. The summer struck cuttings will be filling their pots with roots by this time, and should be repotted. Strong early plants will winter in almost any situation, if the season is not too wet.

Pinks: *A Lady.* Examine your beds occasionally for grubs, which are often very destructive at this season. If a few plants of each variety have been potted as they should have been last month, they will come in very useful for filling up any vacancies made by these insects or other causes. Loosen the surface of the beds when dry, to prevent the soil from becoming green or scur.

SEEDLINGS.

Chinese Primrose: *Rainhill.* Large in size; but not nearly so high coloured as many of the fine kinds now in cultivation.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The summer flowering twiners on the roof of this house, such as Passion-flowers, Ipomœas, Mandevillas, &c., which become unsightly by this season, should now have their final pruning, and everything that will bear it should be severely cut back, in order that the plants underneath may receive all the light possible. The Bignonias do not, however, bear cutting in too freely, as when subjected to this treatment they seldom flower freely; therefore the stronger shoots of these only should be cut back. But although some of these are first-class subjects for a lofty close-roofed conservatory, they are useless in a house that is well ventilated, and kept as cool as possible in summer, and some of them are often grown where they are quite unsuitable. Acacias and other winter flowering plants having been subjected to a period of comparatively dry treatment, should now be liberally supplied with water at the root, in order to get them into flower during the dull season when their blossoms will be doubly valuable. Where these are trained to the principals of the roof, they should be kept within reasonable limits, especially those on the south side of the roof, for the sake of the plants beneath; but this must be done by tieing in the shoots slightly, and not by cutting. These are, however, better adapted for covering pillars than training under the roof—for it is impossible to preserve them in health for many years except in a cool airy situation; and where this and plenty of room can be afforded, many of them are magnificent subjects for winter flowering and furnishing cut flowers. Manure water, where it can be used without annoyance to the family, will be of service to Chrysanthemums, and may be given frequently in a rather strong state. Let the flowering plants be frequently re-arranged so as to produce as much variety as possible, for the finest specimen when allowed to remain long in one place becomes too familiar to be interesting. Stove.—Very little water should now be given to the plants here, which are ripening their wood, and anything like excess must be avoided, even in the case of things in free growth; but these should be frequently looked over, especially such as may be near the heat-giving surfaces, supplying as much as maybe necessary to preserve the soil in a healthy state. Look

sharply after insects, especially black thrips, and endeavour to get these pests completely eradicated, for they are most injurious to the young tender foliage of growing Ixoras and many other things at this season. Tobacco smoke is perhaps the most certain and easily applied remedy for thrips, but where only a few plants are affected, the following mixture may be used for syringing them with, which will be less expensive and troublesome than filling a large house with tobacco smoke. Dissolve half a pound of soft soap in 1½ gallon of soft water, and add three tablespoonfuls of turpentine, and 1 quart of tobacco water, strained through a fine cloth. This should be applied with the syringe, the plants being held over a wide tub so as to collect the mixture and save it for further use; or plants with well matured firm foliage may be dipped into it, but it must be used very cautiously upon things with young tender foliage. This mixture has the recommendation of being used by experienced growers, and if applied in proper time it is a very economical remedy, but where the pest is spread over the house tobacco smoke will be a cheaper and more expeditiously applied remedy.

FLOWER GARDEN AND SHRUBBERIES.

Choice plants in the borders that require a little protection should be seen to at once. Where it can be obtained, Moss forms an excellent article for placing over the roots and about the stems of such things as require a little protection in winter, but unless it can be procured in pieces of some thickness it is not worth using; but old tan, decayed leaves, or anything not liable to retain moisture will answer. Also see to getting the branches of such things as are usually protected in winter covered at once. Dry Fern is an excellent material for this purpose, but it cannot be obtained everywhere, and straw or mats may be used instead. Where alterations are in hand, or intended to be done this season, endeavour to concentrate all the available force upon them, and get them forwarded as expeditiously as circumstances will admit. Be very careful to well secure transplanted things against the wind, and do not let the plants be left until this is done, for it is a very common practice to put this off until the roots are injured through the plants being blown about. Where the leaves are mostly down, get shrubbery borders lightly dug over to give them a fresh clean appearance for the winter. Before turning over the borders, however, any intended alterations in the way of transplanting, &c., should be done, in order to avoid having to tread upon the ground after digging. Where Hollyhocks, Dahlias, &c., are grown in the foreground, the situations for these should also be prepared before digging, by loosening the soil where they are to stand about 2 feet square, and to the depth of 18 inches or 2 feet, well mixing with it a liberal allowance of good rotten manure. Except by way of preparation for these and other herbaceous flowering things, the ground amongst established shrubs should be dug very lightly, and left altogether undisturbed wherever it is not in sight.

FORCING DEPARTMENT.

Pineries.—The trying period for those who have to winter their young stock in pits heated by fermenting materials has now arrived, for with damp sunless weather, such as has prevailed of late, it is a difficult matter to preserve Pines from injury where warmth must be accompanied by excessive moisture. Keep the linings sufficiently strong to maintain the temperature at about 60° or 65°; this will allow of giving air freely on fine days, and a little at all times when doing so does not cause the glass to sink under 55°. There should be no attempt made to induce growth with the present amount of light, but it is necessary, in order to be prepared for severe weather, to keep the linings rather strong. See that efficient coverings are prepared previous to the occurrence of sharp frost, and endeavour to keep the bottom-heat steady at about 75°, and the soil in a rather dry state, for the preservation of the roots in a healthy condition, and preventing their sustaining any check during winter is of the utmost importance. This system of Pine growing is now, however, but little practised, and it would be economy on the part of those who still adopt it to supersede it at once by means of a hot-water apparatus. The saving of labour, to say nothing of the other advantages which the substitution of this would effect, would more than counterbalance the expense of fuel, and this being the case it is strange that Pines should still have to be wintered in "dung pits," particularly as the outlay which would be necessary to effect the change could hardly be worth the consideration of the majority of the parties concerned. With plenty of labour, &c., at command, we have no objections to dung pits for summer use, nor to a well-arranged combination of the two systems of heating, but the command of a dry heat is indispensable in winter.

Vineries.—Houses in which forcing is to be commenced about the end of the present month, should now be cleared and in fit order for working. Let particular attention be given to the state of the heating apparatus, and if any repairs are necessary here, get these executed at once. Where a portion of the roots is inside the house, and the border in a dry state, which it will most probably be in consequence of the treatment adopted to ripen the wood, a good soaking of manure-water, at a temperature of about 80°, should be given a fortnight or so before shutting up the house. This will assist to excite the roots before forcing is commenced, and it is most desirable to have the roots in action previous to this. Do not expose houses intended to be forced early to severe weather, except where the Vines have been infested with black thrips, and in this case exposure to a moderate frost, although it might render the Vines somewhat more tardy in starting, would, nevertheless, be advisable, as it would thoroughly eradicate this pest. Look over ripe Grapes every other day, and examine the bunches carefully for tainted berries; also use fire-heat as sparing as may be consistent with securing a moderately dry state of the atmosphere. Cucumbers.—If these are to do any good in the way of fruiting during the winter, they must be kept near the glass, affording them all the light possible with a brisk warm temperature, and a regular bottom-heat; aim at 75° by day, and 65° by night, and admit a little fresh air whenever the weather will admit, but this should pass over the pipes before it is allowed to come in contact with the foliage of the plants.

FLORISTS' FLOWERS.

Autumnal rains and damp are now the great enemies of the Auricula; great care must be taken that they have abundant ventilation. The best plan to secure this is to have small sliding shutters in the back and front of the brick frames. Polyanthuses in beds should be carefully examined, and should any of the roots be bare, some maiden loam or compost of decayed leaves should be put round them. In mild autumns like the present, trusses of blooms will sometimes appear where the plants are not grown for exhibition; this is, perhaps, not of much consequence, but where plants are required to bloom strong at the proper season, these precocious blooms should be removed.

HARDY FRUIT AND KITCHEN GARDEN.

A sowing of Peas and Beans for the chance of a very early crop should be made in the course of the week. In favoured localities it is usual to sow somewhat earlier in the month, but we have seldom seen much advantage result from sowing before the 20th, and we have frequently had the earliest sowing cut up, while those planted towards the end of the month have weathered the storm uninjured. The Daniel O'Rourke Pea is very considerably the earliest in cultivation, and appears to be equally as hardy as the Prince Albert. It is, therefore, a great acquisition where an early dish is the principal consideration, but it is not nearly equal in quality to Early Emperor or Fairbeard's Conqueror. The Early Mazagan is the best variety of Bean for an early crop. Select a dry sheltered border for these, and guard the seed from the depredations of mice. The forcing of Sea-kale and Rhubarb must now be attended to; and, provided there is a good stock of strong roots, a supply of these will be easily kept up. Where there is room to spare in the Mushroom-house, this forms a very suitable and convenient place for forcing these. The roots should be placed on a slight bed of warm dung, filling up the spaces between them with old tan, or the soil and manure mixed from an old Mushroom bed, giving a good watering to wash it in amongst the roots. The bottom heat should not be allowed to exceed 70°, as too much heat is not favourable to securing strong growth, and, except for the first crop, it may be dispensed with altogether. Take advantage of wet days for making fresh Mushroom beds, and clearing out those that are spent; also collect and prepare droppings for forming fresh beds, by spreading them in any shed, and turning them every day until they are sufficiently dried to prevent excessive fermentation after putting up. Clear up all decaying leaves, &c., and stir the surface of the soil on dry days among growing crops, as Cabbage, Spinach, &c.; also get all vacant ground manured and ridged up as quickly as possible, in order that it may be exposed to the influence of the winter. Get the late crops of Celery closely earthed up first dry day, and attend to securing a late supply of Lettuce and Endive by storing away as many as possible of these in frames, or wherever they can be protected from frost.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.
For the week ending Nov. 16, 1854, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 20th, 1841, and 21st, 1828, 1833—therm. 59 deg.; and the lowest on the 21st, 1833—therm. 21 deg.

Notices to Correspondents.

Books: *J W.* "School Botany," and Hooker's "British Flora."—*E W B.* Our weekly Calendar of Operations will furnish you with excellent advice on the general routine of gardening.‡

Clivia nobilis: *J S.* Keep it cool and dry in winter, so as to give it a season of rest. It will succeed perfectly well in a greenhouse.‡

Covering Material: *J F.* If your object is merely shelter, and you do not require light, then it is doubtful whether you will find any better or cheaper material than wooden shutters, made of rough weather boards. The objection to them is that they are too heavy. There was a very nice light pattern at the last meeting of the Horticultural Society, exhibited by Mr. Dodds, gardener to Colonel Baker, of Salisbury, which was at once light and secure. It was formed of a skeleton frame upon which straw was firmly sown down with tarred twine, and further secured by copper wire here and there. It is to be feared that near London, where everything has to be paid for highly, this contrivance will be too expensive, although it is not so at Salisbury where a good part of the labour is done at odd times and costs nothing. It has been also recommended to sew straw between two layers of galvanised iron netting; and it is not improbable that this is the cheapest and simplest plan yet suggested, but we have not at present seen it at work.

Cupressus funebris: *N W S.* The nurseryman of considerable experience who informed you that seedlings from the Red Cedar are identical with the Cupressus funebris does not know what he is talking about.

Diseases: *R T P.* We have examined very carefully the leaves of your Araucaria. There is no brown scale upon them, nor any appearance of insects. The brown spots consist of denser tissue than that which surrounds them, and have been formed at the expense of the superficial cells. The cell walls are densely coloured, and so disorganised as to suffer the turpentine to escape. The neighbouring cells are gradually involved, and ultimately the whole or the greater part of the leaf perishes. A minute Phoma is then formed in the diseased tissue, but has evidently had no share in producing the malady, which arises, in all probability, from local circumstances which may not admit of remedy. If you have not observed it before the present year, the extreme and long-continued drought may have had something to do with it, and your trees will ultimately recover under more favourable circumstances. Unhappily, in any case, their beauty must be impaired for some time to come. *M. J. B.*

Figs: *W W.* The Brown Turkey is most to be depended on for bearing in this climate out of doors; but for the sake of variety, you may also plant the Brown Ischia, White Marseilles, Pregussata and Angelique.

Fruit Trees: *H H.* Five feet, the distance of your gravel walk from the wall, is too narrow for a fruit-tree border. This should be at least 15 feet wide. You can take up the gravel walk, trench and otherwise prepare the soil, and relay the gravel, beneath which the roots of your trees will then thrive very well. If, however, you could make the walk at the above-proposed distance, you would have a wider border for crops. The aspect being N.N.W., you may try against it the following sorts of Pears:—Marie Louise, Louise Bonne of Jersey, Flemish Beauty, Beurré d'Amanlis; and, for stewing, the Catillac and Vicar of Winkfield. Cherries:—The May Duke Elton, Kentish, and Morello. The Cherries should be planted where the soil is peaty, about 18 feet apart, to be fan trained; the Pears, 20 feet apart.‖

Fruit Trees in Pots: *W W.* Last winter was very severe; yet fruit trees exposed to its rigour were not free from the attacks of the green and the black fly in the summer. On the contrary, both these and the mealy bug were unusually numerous. You therefore cannot depend on the turning your fruit trees out of doors from your orchard-house as an effectual means of destroying the above pests. The trees will not suffer from exposure if you protect the pots as you propose, and take care that the shoots are protected from frost exceeding 10° or 12° below freezing.‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J S.* Gonolobus hispidus.—*W P.* 1, The Pomegranate; 2, Gomphocarpus fruticosus; 3, Tamarix gallica; 4, Euphorbia Lathyris.—*Constant Reader.* Oncidium curtum.—*Erzeroum.* 221, Tamarix germanica; 1455, Tamarix gallica; 1027, Tamarix Hampeana; 628, 645, Viola Pallasi; 28, V. Kitaibeliana; 677, V. odorata hirta; 1102, V. sylvestris; 1034, Cistus salvifolius; 631, C. villosus.—*A S.* Scutellaria coccinea, and a morsel of some Salvia, perhaps splendens.—*J T.* Verbena bonariensis, and a decayed fragment of some Labiate plant quite indeterminable.—*J R M.* When more correspondents than one employ the same name, confusion becomes inevitable. The plant now sent is the very young, or very monstrous state of some Liliaceous (?) genus; but of what it is impossible to say. If it should produce its flowers, and you will then forward a specimen, there will be no difficulty in naming it.

Nitrate of Soda: *Sleaford.* If this salt is employed in Cucumber growing, it should be used in *minute* quantities daily dissolved in the water with which the plants are treated. A little too much is dangerous. You ought not to taste it in the water which dissolves it. The golden rule for all such matters is "little and often."

Pears: *M. de Jonghe.* All received; very interesting. You will hear from us soon.

Planting Currant Trees: *H. H.* Certainly it is preferable to omit the manure at the bottom of the hole in which the trees are planted, and to put some well mixed with the soil around the roots. The latter mode of applying it will have a tendency to induce the roots to keep nearer the surface, and thereby make the tree last longer in a healthy state.‡

Potatoes: *J C N.* The first, or one of the first autumn-planters of Potatoes was Mr. Shepherd, your neighbour in the Calf of Man. You cannot do better than follow his example with the sorts you have, only take care to bury them deep enough to be safe from frost. When spring comes you can draw some of the earth off; or if you have litter to put over the sets when planted, only the usual quantity of earth will be wanted, and there will be nothing to do in the spring.

Removal of Trees: *Cavanensis.* A M'Glashen's apparatus would probably move such trees at once and safely. You would, however, secure the operation by digging a very narrow trench, say 6 inches wide all round the trees, about 3 feet from their stem and 2 feet deep. A draining spade is a proper tool. The operation should be performed in the beginning of August. Having made the trench, the earth may be filled in again, or which is much better the trench may be filled with leaf mould. In November you may take the trees up without danger, when you will find that the main roots have thrown out beautiful fibres into the leaf-mould. Grow the following Strawberries—Cuthill's Black Prince, Roseberry, Old Pine, Keens Seedling, British Queen, Downton, Prolific Hautbois, Alpine, and Elton.

Training on Walls: *D C.* For training Peach trees, the iron studs or nails should be driven as recommended by Mr. Fleming, at 8 or 9 inches apart in the joints between every course of bricks. See volume for 1849, p. 436.‖

Watering Plants: *Old Sub.* By no means allow your plants to stand in pans of water;—saucers or pans are only useful in preventing the water running from the pots, from making a mess. Always apply what water is necessary to the surface of the soil in which your plants are growing, and that only when it really wants it; then give a thorough soaking. Plants are ruined by "a little now, and a little then."‡

Misc: *A Constant Subscriber.* The work, we believe, can be procured through any bookseller.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.

WM. INGLIS CARNE, 10, Mark Lane, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only: and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6*l.* per ton, free to Railway.

They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.

Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Crate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.

Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 30 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

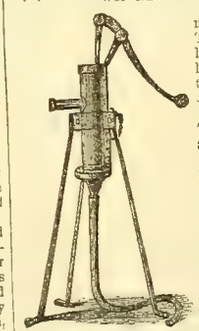
Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2¼ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.



The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

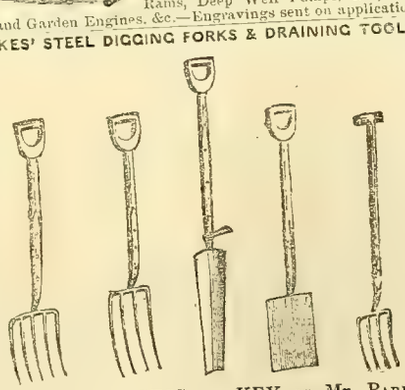
1¼ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.

PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The first Session of 1855 will begin in February. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE SALISBURY AND WESTERN COUNTIES EXHIBITION OF DOMESTIC POULTRY.—The Fourth ANNUAL EXHIBITION will be held on TUESDAY and WEDNESDAY, the 21st and 22d days of November, 1854. Prize Lists, with the Rules and Regulations, can be obtained of the Hon. Secretary, and Subscriptions will be received by Mr. EWER, the Treasurer. T. PAIN, Hon. Sec.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 12th, 13th, 14th, and 15th of December next.

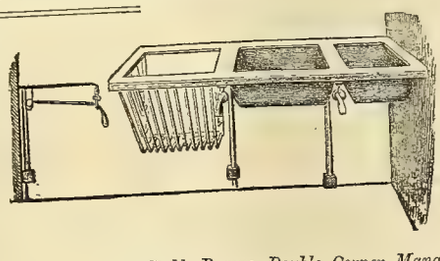
The PRIVATE VIEW and ANNUAL DINNER on TUESDAY, December 12.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.

COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest. The

ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.



Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at their

Works, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

The Agricultural Gazette.

SATURDAY, NOVEMBER 18, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, Nov. 23—Agricultural Imp. Society of Ireland.

THE eradication of weeds is a matter that is always going on and yet never completing, or rather weeds are ever being destroyed but never eradicated. Farmers and gardeners expend much of their strength and energy in getting rid of weeds as they grow, by which means, though the pest is kept considerably in check, so that even a farm may possibly become "clean as a flower garden," to use a favourite expression, yet each year much the same routine of operations as respects weeds has to be gone through, or a little neglect causes the once clean farm to assume as dirty a state as ever.

Now if we revert to the causes of this requirement for constant weeding, we shall find that to a considerable extent as fast as we eradicate with one hand we sow with the other, and we must therefore be constantly pulling weeds, because we are, after all, indefatigably propagating them; an examination therefore of some of the methods by which weed growth is ordinarily continued may not only be a matter of scientific interest but of practical utility.

If we examine the sources of our more general manures, we shall find in these a prolific cause of weed-propagation. For example, the different weeds which affect our cereals, though in a state of seeding they are threshed with the corn, yet the refuse is from time to time scattered over the yard as food for fowls, or, it may be, given in an unground state to pigs; in both these cases, though it is true that much of the seed of weeds thus employed is destroyed in the process of digestion, yet it cannot be denied that this is at best only partial, and many of the harder seeds pass through the systems of animals unchanged. Here, then, the sweepings of the yards which are added to the dung mixings must act as a prolific source of weed growth.

Again, in the neighbourhood of towns, the farmer largely employs as manure the house refuse in the shape of mixings of coal-ashes, refuse vegetable matter, and the whole of the weeds of the garden; the effect of which any observer may see for himself by noticing the great increase of the true agrarian or garden forms of weeds in the crop manured from this source. Dirty samples of seeds may, however, be mentioned as one of the most fertile sources of weed growth; it happens, in the case of some of the smaller seeds, that seeds of weeds are very difficult of separation, and as a consequence a large growth of weeds is insured in the desired crop. But here it would surely be worth while to adopt greater care in the separation of the plant destined for seed from those with which it is intermixed; and yet it is much to be regretted that farmers too often seed dirty crops as the most profitable manner of disposing of them, forgetting that, however they may be deriving present advantage, they are continuing the spread of a pest which, after all, may one day prove troublesome to themselves. As a proof of how weeds are intermixed in seed, it is only necessary to observe what takes place in any crop of Flax grown from foreign seed, as here we introduce species of weeds differing from our own

wild natives, such, for example, as Sinapis, Mustard, various species ;* Camelina sativa, gold of pleasure ; Galium tricorne, rough-fruited bedstraw; Cuscuta epilinum, Flax dodder ; Lolium temulentum, Darnel.

Now, if Flax thus grown be used again on the same farm, it is astonishing, however few the weeds might have been in the first instance, how greatly they become augmented in the second sowing In 1853 we examined a crop of Flax grown from foreign seed, which had in it a few of the weeds above tabulated ; seed from this crop was again sown in another field on the same farm in 1854, the present season, but with a fourfold increase of all the above-named forms of weeds, together with the more usual British examples ; the Dodder, indeed, which presented but a few isolated patches in 1853, in the following year became spread throughout the crop to its irreparable injury.

But after all it is to seeding on the ground, either directly in our own or adjacent fields, that we must attribute the greater amount of mischief from weeds. It is true farmers are ever weeding, but this is often done so imperfectly that enough of a species is left behind not only to ensure its continuance, but often as abundantly as though we had not weeded at all ; for after all, however much of weed seed is left behind, only a portion will usually grow,—thick sowing with weeds, as with a crop, does not always ensure the greatest result, whereas a single plant is often sufficient to cover a whole field, and in such a manner that the germination of most of its seed is insured.

This latter point is one of no small importance for our consideration, as it depends upon the great fecundity of most of our commoner weeds. It was from repeated observations of this subject that induced me to examine into the reproductive powers of weeds during the past summer ; and the following table, it is presumed, will give some interesting matter upon this head. In offering it, however, it should be premised that from the nature of the investigation, rigid exactitude could not be attained ; it is therefore offered with a view to show rather what may be than what is the actual reproductive power of weeds in all cases.

The following table then contains an account of the number of seeds which have been counted in a single individual of each of the undermentioned species ; and in examining, it should be borne in mind that, though all the seeds of plants are not usually fertile, nor do they always arrive at perfection, yet most of them do so, and all of them may.

TABLE OF THE NUMBER OF SEEDS IN A SINGLE WEED PLANT.

	No. of seed vessels or flowers to each plant.	No. of seeds to each vessel or flower.	No. of seeds to each plant.	When gathered in 1854.
Sinapis nigra, black Mustard ...	800	× 10 =	8,000	Aug. 17
„ arvensis, Charlock ...	400	× 10 =	4,000	Sept. 18
Capsella bursa-pastoris, shepherd's purse	150	× 30 =	4,500	Sept. 9
Sisymbrium officinale, common hedge Mustard	450	× 12 =	5,400	Oct. 13
Heracleum sphondylium, cow Parsnip	2,500	× 2 =	5,000	Aug. 17
Æthusa Cynapium, Fool's-parsley	3,000	× 2 =	6,000	„
Convolvulus arvensis, corn bind-weed...	200	× 3 =	600	Sept. 26
Galeopsis Ladanum, henbit Nettle	500	× 4 =	2,000	
Bartsia odontites, red Bartsia ...	400	× 12 =	4,800	Oct. 1
Leontodon taraxacum, Dandelion*	12	×170 =	2,040	„
Centaurea jacobea, hard-head				
Scabious	50	× 80 =	4,000	Sept. 10
Do. nigra, blackhead	50	× 60 =	3,000	„
Lapsana communis, Nipple-wort...	560	× 15 =	8,400	Sept. 23
Anthemis cotula, stinking Chamomile	271	×150 =	40,650	
Matricaria Chamomilla, Mayweed	150	×300 =	45,000	Oct. 14
Chrysanthemum leucanthemum,† ox-eye Daisy	45	×300 =	15,000	Sept. 18
Arctium Lappa, Burdock	613	× 40 =	24,520	Oct. 1
Sonchus oleraceus, sow Thistle ...	100	×250 =	25,000	Sept. 6
„ arvensis, corn sow Thistle	100	×190 =	19,000	„
Senecio vulgaris, Groundsel‡ ...	130	× 50 =	6,500	Sept. 10
Carduus acaulis, stemless Thistle	6	×100 =	600	Sept. 8
„ nutans, musk Thistle ...	25	×150 =	3,750	Oct. 13
Agrostemma Githago, Corn-cockle	7	×370 =	2,940	Sept. 8
Lychnis dioica, common Campion	25	×137 =	3,425	Oct. 1
Papaver Rhæas, red Poppy ...	100	×500 =	50,000	Oct. 19
„ dubium	100	×600 =	60,000	Oct. 14
Galium aparine, Cleavers	550	× 2 =	1,100	Sept. 11
Rumex obtusifolius, common Dock	13,000		13,000	Sept. 15
Euphorbia exigua, dwarf-spurge ...	500	× 3 =	1,500	Sept. 19
„ Peplus, Tetty-spurge ...	400	× 3 =	1,200	Sept. 11
„ helioscopia, Sun-spurge	324	× 3 =	1,072	Oct. 14

Now, on examining this list, we find the following six plants may perfect in round numbers

Sonchus arvensis	19,000 seeds to each plant.
„ oleraceus ...	25,000 „
Anthemis cotula	40,000 „
Matricaria Chamomilla ...	45,000 „
Papaver Rhæas	50,000 „
„ dubium	60,000 „

Here, then, we can have no difficulty in accounting for their occasional spread over whole fields—inasmuch as two or three plants, for example, may flower on the manure heap, and thus be spread over the surface in the manure ; or, as in the case of the Sonchus, and all those with winged seeds, our own grounds may be planted from no carelessness of ours, but from the inattention of a slovenly neighbour. In my own immediate district there is at this present moment a field of Turnips of about 14 acres so perfectly white from Anthemis cotula that it would be difficult to plant even a crop more regular and uniform ; and in no way can its presence be accounted for, unless upon the supposition of its having been planted.

Again, take the common Charlock : 4000 seeds may be perfected by a single plant ; and, if we trace their history, we shall find that some will be, in ploughing, too deeply covered for germination —say in the Turnip crop. Of those that grow with this crop, Turnip culture, if carefully conducted, may destroy the whole. The Turnips, however, may be followed by Barley, the tillage for which has exposed a fresh lot of the Charlock to the proper influences for growth, and a plant here and there ripens its complement of seeds, many of which are sown before the crop is removed, and many taken away with the crop itself, so that for the want of a little attention before the grain got to any height (for it is seldom this plant is observed until it is in flower), we not only cause in one year sufficient seed to be sown to last for a generation, but we take off a supply to be planted on the farm by means of manure refuse, and scattering in the exuviæ of wandering animals, among which may be reckoned every species of seed-eating bird.

From these remarks it follows that in dealing with weeds we should not only content ourselves with destroying them when they appear, but we should study their natural history, by which means we shall be the better able to prevent their constant and regular re-appearance in our crops : as by proper and well-regulated attention to the subject in all its bearings, we can see no reason why each crop should in its rotation, time after time, present us with exactly the same weeds to deal with, and the same weeding work to be done.

* Foreign Flax often introduces to a district a Mustard-Charlock not before observed there, in which case it may become a permanent addition to the weed list of a parish.

* This keeps flowering the greater part of the year, so that four times the number of heads set down are frequently produced.

† In one head I counted as many as 400 seeds.

‡ On one root was counted 970 flowers.

TOWN SEWAGE.

"We venture to think that the projector who does not agree with Mr. Wicksteed must be very mad indeed."

It is said to be a dangerous thing to venture to express one's disagreement with the strong conviction of high editorial authority, but at all risks I protest against the conclusion so decidedly expressed in your last leader. I hope to be able to show that Mr. Wicksteed's is the "mad" view of the case, and that "common sense and common calculation," which teach us that our manure is our food, imperatively resolve that the application of the sewage of London to agricultural fructification is a necessity of our times.

Although I am not unfrequently denounced by my agricultural opponents as "visionary" and enthusiastic (I plead guilty to the latter), I have all my life been guided in matters of business by the simple rules of arithmetic, preferring addition and multiplication to subtraction and division — and by these rules and common illustration I propose to disabuse your mind of its erroneous impressions.

In order to arrive at just conclusions, we must compare men with animals. A man of 14 stone would weigh 196 lbs., and a sheep of 12½ stone net dead weight would weigh the same, alive, as the man ; both weights are above the average, therefore we may safely assume that the manure from both would be of nearly equal value.

Taking the 2,500,000 men, women, and children of the metropolis as equal to 1,500,000 adults, or sheep, we have a basis for our calculation. I know farmers who place 1500 sheep 24 hours on 1 acre of land, and consider it sufficiently manured for the year ; but, of course, for green and root crops they would be too happy to quintuple that number : 1,500,000 men or sheep would, at 7500 per acre, manure 200 acres for one day, or 73,000 acres for one year ; which, taking 640 acres as a square mile, would be 114 square miles, or a square area of about 10½ miles, or five to six miles around the metropolis.

I do not recommend so small an area, but quote this to show how absurdly exaggerated have been the statements you quote.

	Gallons.
The daily supply of water to the metropolis is about	50,000,000
Add the liquid and solid manure	500,000
	50,500,000

We have no difficulty in estimating the cost of elevating this to a given height, or forcing it to a given distance. Take Croydon as an illustration. There 650,000 gallons of water are daily pumped to a mile distant, and elevated 150 feet, at a cost of 13½ cwt. of dust-coal per 24 hours, or 13*s.* 6*d.* worth of fuel, which including two engineers at 42*s.* per week, two stokers at 25*s.* per week, interest on several thousand pounds, for Cornish 25-horse power engine, buildings, &c., does not amount to one farthing per ton. Now as the daily water supply and sewage of London is only 200,000 tons, at one farthing per ton, it would be only 200*l.* per day, or 73,000*l.* per annum.

Every farmer knows that a sheep's manure for one year is worth at least 6*s.* It follows, then, that the manure of the 1,500,000 adult sheep of London would, at that low estimate, be worth 450,000*l.* Prof. Way, however, estimates the London sewage at 2,000,000*l.* —seeing how many other good things it contains. Of course a thousand considerations enter into the general question, the rain-fall being an important one ; but I maintain that on all the worn-out, milk-exhausted pastures for miles round London, the *water alone*, as irrigation, would pay during summer, and that is precisely the time when it is desirable that the sewage of London should not pollute the Thames. In winter, or during heavy rains, we could do as we liked about using it.

The whole question is, so far as the mechanical part goes, perfectly insignificant. The difficulty is in people's minds and brains. Ascend the Thames at low water, watch the puny dribblings that flow from our "great" sewers, and compare them with the gigantic masses of water upheaved in locomotion by the half-a-dozen revolutions of the paddles of the penny boat that conveys you, whose engines of 20 horse-power consume one ton of coals a day. You will then conclude, as I have long since done, that the time will soon come when that public opinion and common sense which interlaced the kingdom with iron railways, at an expense of hundreds of millions, to economise *time*, will equally establish a subterranean circulation for the economy or production of our *food ;* and we shall no longer run whining to Peru for cheap birds' dung, whilst we throw our own down our rivers to pollute our drink.

The miserable, though well bred, cows of our suburban dairies—the knock-kneed, pale, and puny children of our courts and alleys—appeal to us in unmistakeable language to restore to mother earth those phosphates and that nitrogen of which we have so long robbed her, and without any grateful return, and which are so necessary for juvenile development at early ages.

The quantity of manure and of water that may be profitably applied to certain soils is evidenced by the fact that Mr. Telfer, of Canning Park, Ayr, puts on for his Italian Rye-grass per Scotch acre, at four or five dressings, 25 cwt. of guano, the urine of 10 cows, and 500 tons of water—and this in a moist climate. The Edinburgh meadows are supposed to receive 6000 tons of town sewage per Scotch acre. The hot gravels, dry chalks, and thirsty sands around London will absorb, with thankfulness and profit, all the good things that now run down our sewers. The Earl of Essex is laying down pipes to take the sewage of Watford at 10*l.* per annum ; Mr. Walker takes Rugby at 50*l.* ; Colchester, Chelmsford, Braintree, and many other towns are entertaining the same question. Of course your readers know that from 15*l.* to 30*l.* rent per Scotch acre is paid annually by the Edinburgh cowkeepers for the Scotch irrigated meadows. *J. Mechi, Tiptree Hall, Nov.* 8.

Nov. 14.—I have just received a letter from my friend Mr. Samuel Brooks, of Manchester, who says :— "I have sent you a Manchester newspaper, in which you will see I have offered a premium of 1000*l.* for the best mode of using the nightsoil and sewerage of this city for agricultural purposes ;" and he also says, "I hope it will be an example for other towns to move in the same direction." We must all admire this noble act, pregnant with useful results to sanitary reform and agricultural amendment. *J. M.*

THE ECONOMY OF AGRICULTURAL LABOUR.

(*Continued from p.* 731.)

Horse Labour.—It is of the greatest importance to economise our horse labour, and to have the work performed when the land is in a proper state for it ; for then the labour is most efficient and much easier performed. In laying out our fields we have made them from 10 to 16 chains long, so that 16 chains long and 6½ in width make 10 acres. Now I find, from watching the horses at work at various times, the average time required for the horses to travel 14 chains when ploughing is about five minutes—this is about two miles per hour ; and that the average time taken in turning at the land's end is half a minute, thus one-tenth of his time is employed in turning, and nine-tenths efficiently employed ; now, as we reckon a day's work of a horse to be 10 hours, and deducting therefrom the time employed in turning, and half an hour employed in going to and from his work, we have 8½ hours of efficient labour, and the horse may have travelled from 18 to 20 miles daily in his work, when in the plough or other implement.

The succession of our crops is so arranged as to give constant employment to our horses throughout the year ; and as we endeavour to perform every application of labour when the land is in the best state for the work to be done, we have horse-strength sufficient to accomplish this when the season and the weather permits it ; and no work requiring to be performed has to wait till we have time or strength sufficient to perform it ; and in all our work we have sufficient manual strength at command to keep our horses fully employed.

A day's work of two horses in ploughing, harrowing, &c., we reckon to be 10 hours out of the stable, walking at the rate of two and a quarter miles per hour, or from 18 to 20 miles, with a draught of from 3 to 6 cwt., and ploughing from 1¼ to 1½ acre per day.

There is a much greater amount of work done, in a better state, and at a cheaper rate, by good, active, powerful horses—well-fed, and men well paid—than by weak, slow, inactive, ill-fed horses, and weak men and boys at low wages.

We have eight powerful horses employed on the

farm, one of them, however, is also the gig-horse; and we find this animal power is equal to the cultivation of 240 acres of arable land, 120 of which are in Wheat and Oats, 10 acres are in Beans, 10 acres in Potatoes, 10 acres in Carrots, 30 acres in Swedes, 30 acres in Mangold, and 30 acres in Clover. This gives 60 acres of land cultivated by a pair of horses.

In estimating the yearly expense of our horse power it will be necessary to show the first cost of the horses, the expenses of maintaining them, the cost of the implements and keeping them in repair, and the per centage necessary to form a sinking fund to replace them after they are worn out. The horses cost us 250*l.*

The Implements used by the horses:—

Harness for 8 horses at 5*l.* each... ...	...	£40	0 0
6 carts, 10*l.* each	...	60	0 0
6 harvest frames to ditto, 4*l.* each ...	...	24	0 0
4 ploughs, 3*l.* 10*s.* each	...	14	0 0
3 pairs of heavy iron harrows, 3*l.* each	...	9	0 0
1 pair of light seed iron harrows ...	...	2	10 0
4 sets draught-trees	...	1	10 0
2 cultivators, 9*l.* 10*s.* each	...	19	0 0
2 rollers	...	10	10 0
4-horse horse-grubber	...	10	0 0
1 Turnip-sowing machine	...	6	0 0
1 Clover seed sowing machine	...	2	0 0
Prongs, grapes, shovels, muck-hauk ...	...	1	10 0
Corn-chest	...	2	0 0
Wheelbarrow	...	0	15 0
Corn-measures and water-pails... ...	...	1	5 0
Cart-ropes, scythe, and rake	...	1	15 0
Cost of Implements	...	205	15 0
Cost of the horses	...	250	0 0
The first cost of horses and the implements used by them is		£455	15 0

The Food which the Horses Consume.—The daily quantity of corn which the horses consume varies according to the quantity of labour they are performing; the hardest work they have to do is after the corn harvest is over, as they have to prepare the land for the winter Beans and drill them, harvest 80 acres of roots, carting them from the field to the store, and then prepare the land and sow the Wheat after the land has been cleared of the roots. During this process from the 1st September to the 1st January, say 120 days, each horse has 20 lbs. of Oats and Beans daily, and as many Carrots as they can eat, which is about 50 lbs. (after the Clover is all consumed). They have as much Oat or Wheat straw as they like. From the 1st January to the 1st March their work is not nearly so hard, and during this period of 61 days they with their Carrots only get 10 lbs. of corn each per day. From the 1st March to the 15th May, they require to perform much hard work and make longer days; they have for these 75 days 20 lbs. of corn. About this time we begin to cut Clover, and from the 15th May to the 15th June, 21 days, they have 15 lbs. of corn and as much Clover as they can eat, and as their work is now much lighter they have only 5 lbs. of corn, with as much Clover as they can eat for the remaining 87 days.

The Calculation of Corn as Food for the Horses.	Lbs. of corn.
From the 1st of Sept. to 1st Jan., 121 days, at 20 lbs. per day	2420
From 1st of January to 1st March, 61 days, at 10 lbs. per day	610
From 1st March to 15th May, 75 days, 20 lbs. per day ...	1500
From 15th May to 15th June, 21 days, 15 lbs. per day ...	465
From 15th June to 1st of Sept., 75 days, 5 lbs. per day ...	390
Say 40 lbs. to a bushel	40)5385
Bushels ...	134.6

This is 134¾ bushels of corn of 40 lbs. per bushel for each horse per annum, so that the eight horses consume 1076 bushels per annum, besides the Clover during the summer and Carrots during the winter and spring. The extent of land required to produce these 1076 bushels, or 43,040 lbs. of corn, Oats, and Beans, we take the following, say:—

10 acres of Oats, of 80 bsh. per acre = 800 bsh., of 40 lbs. per bsh. = 32,000 lbs., at 2*s.* 6*d.* per bsh.	£	99	0 0
5 „ of Beans, of 40 bsh. per acre = 200 bsh., of 60 lbs. per bsh. = 12,000 lbs., at 4*s.* per bushel		40	0 0
Total ... 1000 bsh. = 44,000 lbs. ...	£	139	0 0
The Carrots which the horses consume in 242 days weigh about 60 tons, at 10*s.* per ton ...		30	0 0
3 „ of 20 tons per acre, will give this quantity.			
3 „ of Clover will be capable of supplying the eight horses with all that they require or can consume in 123 days, at say 7*l.* per acre ...		21	0 0
Say Oat or Wheat straw, cut into chaff, 10 tons for 240 days, at 25*s.* per ton		12	10 0
Say Wheat straw for litter, 20 tons, at 20*s.* per ton		20	0 0
21 acres. Expense of horse food per annum ...		222	10 0

Thus the produce of 21 acres of Oats, Beans, Carrots, and Clover supplies the food which the eight horses consume per annum while they are employed in cultivating our farm of 240 acres of arable land; that is, the horse-power derived from the consumption of the produce of 21 acres is equal to the horse-power required to cultivate 240 acres, being all under the system of alternate husbandry. But in estimating the money expense of our horse-power, there are other elements than the food which the horses consume; there are the tradesmen's bills, the legal interest of 5 per cent. on the cost of horses and implements, and also 10 per cent. to form a sinking fund out of which to pay for the replacing of the implements and the horses as they are worn out, so as to leave the whole at the same value at the end of our term as they cost at the beginning.

The expense of the horses' food for one year see above	£	222	10 0
Deduct from this 17 loads or tons of manure for each horse—136 loads from the 8 horses, at 4*s.* per ton ...		27	4 0
Carry forward ...	£	195	6 0

Brought forward ...	£	195	6 0
Saddler's bill, 10*s.* per horse	£4	0 0	
Farrier's bill, 5*s.* per horse	2	0 0	
Blacksmith for sharpening ploughs and harrows—3*l.* per plough	12	0 0	
Carpenter's bill, carts and implements, 10*s.* per horse	4	0 0	22 0 0
To insurance of 8 horses, value 250*l.*, against death, at 5 per cent.			12 10 0
Legal interest on the cost of horses and implements—250*l.* × 205*l.* 15*s.* = 455*l.* 15*s.*, at 5 per cent.			22 15 9
To interest on 455*l.* 15*s.*, to replace the implements and horses when worn out, and of loss on sale; this we have found to be equal to 10 per cent.			45 10 9
The 8 horses must do work equal in money value to			£298 2 6

to cover the expense they have cost us.

To ascertain the money value of a day's work of a horse we must divide his yearly cost by the number of days during which he can work out of doors during the year; as the carting of manure or goods on the roads can be done in wet weather, although we cannot cultivate the land, we may reckon on 260 days which our horses have worked per annum. Divide the cost (298*l.* 2*s.* 6*d.*) by 260 days, and this gives 23*s.* for the work of eight horses, or 2*s.* 10½*d.* for the work of one horse per day; but this is the money cost of one horse without the man. We must in the same way get at the cost of the ploughman who works a pair of horses.

We have three men and a stout boy; their wages are 13*s.*, 12*s.*, 12*s.*, 8*s.* or 5*s.*,—in all 117*l.*, which, being divided by the 260 days that the horses work yearly, gives 9*s.* for the four men, or 2*s.* 3*d.* per man per day's work with the horses.

The total cost of the horses, as above, is or 2*s.* 10½*d* each horse per day.	...	£	298 2 6
The total cost of the four men is or 2*s.* 3*d.* per day per man.	... ...		117 0 0
		£	415 2 6
Then if we take the cost of two horses at ... and the work of the man at	... ...	5*s.* 9*d.* a day. 2 3 „	

We have the cost of the work of a man and 2 horses, 8*s.* 0*d.* a day.

Home Correspondence.

Tarvin "Penny Bank," or Saving Fund, opened on Monday evening, the 9th of February, 1852, for the purpose of offering to the industrious classes of the parish an opportunity of banking their smallest savings, without trouble, expense, or loss of time. Any sum, however small, will be received and entered in a check-book, to be retained by the depositor. The aggregate sum will be banked weekly in the name of the Trustee; but, so soon as any depositor shall have saved 17*s.* (that being the lowest amount on which the Savings Bank allows interest), an account will be opened at the Chester Savings Bank, in his or her name, and that amount deposited therein. Subsequent small savings will, however, be received from the same parties, and added to the Chester account, at such stated periods as may be found advisable. *W. Milburn, Trustee and Secretary, Duddon Lodge, 29th Jan.* 1852.—We append the statements up to Feb. 1853, and Sep. 1854, respectively:—

Statement of the Tarvin Penny Bank, from February, 1852, to February 1853, *being the first year of its existence:—*			
Total number of depositors	56		
Total amount deposited		£80	10 10
Number of depositors for whom accounts have been opened, in their own names, in the Chester Savings Bank	20		
Amount lodged at Chester to the credit of these twenty accounts		£66	5 2
Amount in the Tarvin Penny Bank, being accounts yet under 17*s.* each, and balances towards further deposits at Chester		14	5 8
		£80	10 10

Opened February, 1852. Attendance at the National School-room, Tarvin, every Monday evening, from eight to half-past eight; at the school-room, Kelsall, every Saturday evening, from eight to half-past eight; and at the school-room, Clotton, every Monday evening, from eight to half-past eight.

Total number of accounts opened		74
Accounts withdrawn	20	
Accounts on books at present	54—74	
Accounts opened at Chester	32	
Accounts not yet amounting to 17*s.* each	22—54	
Amount deposited in Chester Savings Bank to credit of the above 32 accounts	£225	8 0
Balances yet under 17*s.* each, belonging to the above 32 accounts	3	13 0
Amounts received from 22 depositors, none of whom have yet saved 17*s.* each	4	14 11
Total amount deposited	£233	15 11

Analysis of the accounts of the 32 depositors who have had accounts opened at Chester £225 8 0

W. Milburn, Treasurer.

Duddon Lodge, September, 1854.

Landlord and Tenant.—In common with yourself, and no doubt many of your readers, I noticed with surprise, not, I confess, unmingled with indignation, the very unguarded and illiberal attack of Mr. Colvile, M.P., on the amusements of the tenant farmers; a proceeding the more to be regretted from its standing out in such unfortunate contrast with the growing liberality and rapid advance of intelligence amongst almost all classes of the community. Mr. Colvile, I admit, may adduce precedents for his anathema against the pianotorte in farm-houses; amongst others, that most excellent writer, but most execrable farmer, Arthur Young, who never saw one in a farm-house but he wished it burnt!—a remark which, from such a quarter, produced more amusement than indignation at the time, but which, echoed by a man of Mr. Colvile's standing and influence, "though it may make the unskilful laugh, cannot but make the judicious grieve." So far from joining in this senseless outcry against music, or any other equally rational and agreeable recreation to the farmer and his household, I confess I regard the subject in a very different light, and am always disposed to consider it as a favourable omen of the intelligence of the possessor, and eminently conducive to the rational enjoyment of any family in the seclusion of the country, and who from the peculiarity of their position must necessarily be debarred from the general amusements of a town. It is for this reason I always feel a strong desire to promote to the utmost of my humble means the development of such a faculty; not more from a love for the science in itself than from what I consider a sense of duty to my neighbour; for surely any amusement which, like this of music, tends to soothe the sorrows and anxieties of life, to elevate the mind, and to impart a taste for a higher order of pleasures than usually falls to the lot of but too many farmers' families, cannot fail of being included among our most neighbourly acts. Nor do I speak without book on this, to me, interesting topic. I am now descending the hill of life; but the memory of "Auld lang syne" is still vivid within me; and, in imagination, I yet join in the family evening concert, which was sure to succeed the labours of the day; and which if not of the highest order of art, never failed to produce effects at once pleasing and permanent. I may be reminded that, like but too many other advocates, I have exaggerated my case and misstated the facts, and that Mr. Colvile's invective against pianofortes in farm-houses was directed, not so much against the rational use of them in the manner I have described, as their abuse for the mere purpose of display, and an absurd attempt to ape the manners of the wealthier classes. In a few instances this may be true; but where are we to draw the line between mere display and real rational enjoyment? Certainly not by the suppression of music altogether, as a science beyond the attainment of all but the privileged orders. I have shown its value in cases that have come within my own knowledge. Many similar testimonials might be adduced in its favour, amply confirmatory of the importance of cultivating a sound practical knowledge of the science of social harmony. Away, then, with the foolish prejudice against it on the part of a certain clique, because, forsooth, it is in their estimation beyond the reach of a mere tenant-farmer—"lifting him out of his proper sphere," that is the cant phrase with but too many such—instead of keeping his neck to the yoke, as a mere hewer of wood and a drawer of water. Happily for us is it that the days of feudal tyranny are past, and still more happily that our lot is not cast in Russia, where the tenant is but the vassal or serf of the lord; and though neither I nor any English yeoman would accuse Mr. Colvile of the absurdity of wishing to restore this state of things amongst us, we cannot help viewing his sentiments with suspicion, as tending not to our advancement in civilisation and the arts, but, on the contrary, to our positive degradation as a class. Against any such opinions I beg, for one, to enter my humble protest, being firmly convinced that it is the policy, not less than the duty, of every landlord to do all that in him lies to exalt, rather than to lower, the standard of intellectual enjoyment among those whom he may consider his dependents, but who are, in reality, the main props of his house, and ought to be esteemed as his best friends. *T., Gloucester, Nov.* 10.

Finger and Toe in Roots.—I had this year Sutton's Elvethan Long Red and Orange Globe Mangold growing alongside each other; the Long Red is considerably affected with finger and toe, whilst the Orange Globe is remarkably clear, and free from disease. Messrs. Sutton supplied the seed of each, and in point of weight the difference is not so great—six roots of Orange Globe clean dressed weighed 61 lbs.; six roots of Elvethan Long Red, 55 lbs. But how does it happen that one sort should be diseased and the other entirely free? Can any of your readers explain the reason? No doubt this has been a very bad season for green crops, no rain having fallen in this neighbourhood (with the exception of light showers) since February till the end of October. The want of water has been most severely felt: Turnips are not half an average; the hay crop was very light; and keeping of every sort commands an extravagant price. *J. B. Maunsell, Thorpe Malsor, Northampton.*

Rape-cake as Food.— Your correspondent "Y.'s" statement of the results he obtains in beef and milk, from a described mode of feeding his fattening cattle and milch cows, is very valuable from its precision, no less than from its exhibiting the practical realisation of the demonstration of science of the worth of an article (Rape-cake) hitherto lightly esteemed by feeders and dairymen. He has already replied to several queries, will he kindly reply to the following:—At what hours are your cattle fed? Is the cooked food given at one meal?—alone, or with a proportion of Turnips? *S.*—— [In answer to the enquiry of "S.," I supply my fattening and milch cows early in the morning—at half-past 5 to

6 o'clock, with first a portion of steamed food, then with one of Turnips or other roots; on these being eaten, chopped straw is given to the fattening, and meadow hay to the dairy cows. The same three courses—steamed food, roots, and chopped straw or hay—are repeated at noon, and again in the evening, being three meals similar in quantity and quality per day. My consumption of Rape-cake at present is about 200 lbs., and of Bran 100 lbs. each day, the whole of which are eaten up clean by nearly 50 cattle. *Y.*]

Liquid Manure.—Although I am no farmer, I have watched with considerable interest the discussion which has been carried on in the pages of the *Agricultural Gazette*, relative to the merits of liquid manure as a fertiliser, and am somewhat surprised at the amount of ignorance and obstinacy evinced by those who refuse to believe that liquid manure possesses such wonderful powers as their more scientific friends have proved it to possess. Now I have seen several experiments tried with liquid manure, and although I cannot furnish you with any minute particulars, I can with safety say that every experiment has proved more or less its value and importance. I have seen it used to Asparagus, Celery, Gooseberries, Currants, and the whole of the Cabbage tribe, with astonishing success; and, in one instance, where a portion of a meadow was measured out and watered with the drainings from a cow-shed, the piece of ground so manured showed it not only in the five or six cuttings obtained that season, but also in the hay crop of the succeeding year, the Grass being of a darker colour, and standing much thicker on the ground. If those gentlemen who have no belief in 65 tons of Grass to the acre will just pay a visit to any nursery where florist flowers are grown, they will there see that the liquid manure pot is considered quite indispensable, and they will need to keep their eyes open lest they should fall into one of the numerous tanks for the manufacture of that useful article. *A Gardener.*

Italian Rye-grass.—It grieves me to find myself in a pitched battle with Mr. Beale Browne; I wrote my few lines in the *Gardeners' Chronicle* without knowing he was taking any part in the dispute about the Italian Rye-grass. We are now before the public in the same service—the cause of truth; he is as fully convinced of the impossibility of growing the equivalent in Grass of 20 loads of hay per acre (Scotch) as I am that it can be done with my plant by any man (who has good land, well drained, and ordinarily retentive) that will inform himself of the mode, and diligently pursue the practice. He I know is a Christian man; I hope I am so too, so I will talk to him as though we were walking and talking as we did when we last met, and will ask him why he disbelieves this great fact. Have not great facts been constant occurrences in our own days? and are not impossibilities proved possible almost every day? I will pass by all the discoveries made up to a recent period, and simply ask what was said to Dr. Jenner when he introduced vaccination to relieve the sufferings of almost every individual born into the world, was he not hunted down almost like a wild beast? What of gas, so beneficial to us?—was not gas to have blown up the world ere this? At all events London was to have been consumed long ago. What of the discovery of the precious metal in such vast quantities to enable increased population to carry on their transactions? What of chloroform, by which the most agonising sufferings of human nature are relieved, and the whole nervous system brought into subjection—was not that one of the agents of the evil one? What of the electric telegraph, by which immediate communication is kept up from one end of the globe to the other? who could believe it? who even now can understand it?—still it is true; they were all impossibilities, they are now all admitted truths. Is it too marvellous to believe that the sufferings of humanity should be diminished in so wonderful a manner, step by step, that the population should have increased so extensively, and that there should not be an equally wonderful mode illustrated of increasing the quantity of food to supply their wants? Think of this. If we can increase the quantity of Grass four times, we shall have four times the beef, mutton, every kind of flesh, wool, and leather for clothing, and of everything that can be mentioned. It is the grand starting point of successful agriculture—the quantity of Wheat, Barley, Oats, &c., is dependent upon it. This now so strongly disputed statement was given by me in various ways at different places, ten years since, to the Royal Agricultural Society, and published in their journal, vol. vi., part 2, page 575; to the Yorkshire Agricultural, and in their Journal in 1845, page 44; to a Committee of the House of Commons on Metropolitan Sewage Manure, in 1846, look at page 46, question and answer 653: 100 tons of the Grass to the acre was the possibility upon which I doubted, and only doubted. These statements were copied into most of the provincial farmers' journals. My farm was kept open by public notice to all comers for seven years, for the express purpose of illustrating beyond doubt this very fact; now, it must not be mentioned in a society of the most enlightened agriculturists, except at the risk of a man's life. Although I quote this I do not believe it; I have a better opinion of my countrymen. Hundreds came to look, confident of the fallacy; no one went away, that I heard of, without being convinced of the truth; the stoutest unbelievers became the most fully convinced, they took the most trouble and could not help believing. Capt. Buller (now no more) would not be content till he saw a crop mown, grown again, and a yard cut in his presence and weighed (Sept. 9) after a crop of seed; it weighed $5\frac{3}{4}$ lbs.—12 tons 8 cwt. to the acre. This was dried 12 days in the atmosphere, it then weighed $2\frac{3}{4}$ lbs. drawing the scale; put in a room for three days, at 59° Fahr., still $2\frac{3}{4}$ lbs.; three days further, at 70°, 2 lbs. 10 oz.; roasted in a sack before the fire for two hours, 2 lbs. $6\frac{1}{2}$ oz.—this is 5 tons 3 cwt. to the acre of hay. Capt. Buller saw the two crops cut, and the last weighed; I dried and weighed it myself. He went away, practised it successfully, and has left his testimony in print (Royal Agricultural Society's Journal, vol. viii., Part 2), that 40 or 50 tons of this Grass might be grown per acre per annum; the profit of his per acre was *7l. 9s. 8d.* The late Earl Wharncliffe sent his friend Mr. Stansfield to see the plant and examine it as to the truth of the statement; he saw, believed, and vouched for the truth in public before 300 persons at the council dinner at Beverley in 1845. Earl Lonsdale took great care to examine as to its truth; I believe, was convinced. One of my own agricultural friends, to whom I made a similar statement, thought me mad and unfit to be left at liberty with my large concern; he saw and acknowledged that if either of us was mad, he was the man. I will undertake to convince Mr. Beale Browne also, and enlist him an advocate on my side, very much to his profit now that he is so large a landowner and farmer too; this will not convince the agricultural world; every man beside is interested:—the eater and the grower in the first degree,—the landlord most particularly so: it ought, therefore, now to be established upon a solid basis if true—if false, to be rejected. We began in the cause of Truth; let us call in her sister Charity to assist us to finish, by showing beyond doubt what can be done even in this poor half-starved country. Let him find 50 persons to produce *100l.* each, the half of which to be applied at once to charitable institutions to be agreed upon; and I will find *100l.* to be added to the other half. I will try my skill to cut from a plant of my Italian Rye-grass 40 tons, or the proportion of it, in one year from a Scotch acre of this poor land in the New Forest either the ensuing or following year. If I fail I will forfeit my *100l.* to Sister Charity; if I succeed I will take up my own money only, and give to the agricultural world an invaluable testimony of what may be done upon land, acknowledged by everybody bad in quality and desperately poor. I have no steam-engine, no liquid manure pipes, no experience in managing the land, having only taken the farm at Michaelmas 1853, and came here in April last. I may fail from many causes—bad health, bad seasons, ignorance of the mode of managing the land; I can use the means but cannot command success, that is with Him whose I am and whom I hope I serve. I have farmed hitherto the clay surface and clay subsoil of the London basin. I now begin with gravel, and am eaten up with rabbits, against which I must fence for my experiment, so shall undertake but a small slice. Fifty tons of Grass are the equivalent of 20 tons of hay, but I must be content to start with 40 tons. I will take this opportunity of stating that I have nothing at present to show, lest persons should come a distance and be disappointed. The pamphlet promised I will endeavour to get ready early in the spring, when notice of its appearing, and address of the vender shall be given in the *Agricultural Gazette*. *William Dickenson, New Park, Lymington, Hants.*

Sewage Manure.—I had occasion, during the progress of the Croydon system of town drainage, to communicate the results of many chemical experiments made by me, with a view of ascertaining the agency of certain substances recommended or employed as deodorisers of the fluid matters conveyed from every house through glazed stone pipes of various calibres, and finally conducted to one common receptacle, called a filter, situated in a place to the west of the town, near to, but below the level of the Epsom line of railway. Frequent allusions had been made to the great value of the solid matters as a manure, and many schemes suggested for their separation from the great volume of water which held them partially suspended. Every attempt proved vain—even when recourse was had to the famed peat charcoal, which, though it deodorised the sewage, and permitted the water to pass through it in a pellucid state, yet entirely failed to attract and fix the ammonia and other valuable saline matters. Dr. Anderson, of Glasgow, and Mr. Way, chemist of the Royal Agricultural Society, established these leading facts, which were confirmed here by the experiments with peat that I undertook for the Local Board of Health in 1853. Professor Way has recently announced that—"a gallon of sewage taken at mid-day did not contain enough solid to admit of examination;" and again—"a quantity of the solid matter was collected at the mouth of the Croydon sewer by a flannel bag, then drained as much as possible, and afterwards dried sufficiently for analysis: it only yielded nitrogen 3·27 per cent.—equal to 3 94 of ammonia. Such was a type of the best result which can be obtained by mere filtration of the solids." We assert nothing concerning what has been, or is attempted, in order to produce a solid and pulverised manure in any degree approaching to sound guano; but we have no hesitation in saying that if nitre, or lime, or carbonate of ammonia, or any other chemical, be combined artificially with solid sewage, or with the shale, peat, charcoal, &c., employed as a deodoriser, the produce so obtained is no longer sewage manure, but a mixed hotch-potch of greater or less value, as the case may be; but certainly artificial, and little likely to remunerate either the manufacturer, or the farmer who may be tempted to plough it into his land. *J. T., Croydon, Nov.* 10.

Seeding Thin and Thick.—In a former paragraph we noticed an extraordinary production of Wheat, grown by us from 18 grains on 1 square yard of land, or about 6 pints of seed per acre, viz., 466 ears, containing 1 quart, equal to 18 quarters 7 bushels and 1 peck per statute acre; and now proceed to describe the exact produce we grew on another square yard, with similar treatment, at the opposite extreme, from 317 grains, or about 2 to 3 bushels, or 192 pints per acre. On account of its extreme thickness, though every grain was planted with strict precision, and all came up with the greatest regularity, not more than 80 stools or stubs were observed to produce corn, numbering only 94 ears, most of which were small, and the straw very weak, and a striking contrast to those grown on the thin principle. The rest of the plants totally failed, and drooped under the influence of the summer's sun. The exact produce was a quarter of a pint, equal to only 2 quarters 2 bushels 3 pecks and 5 quarts per acre, and that of very inferior quality, and which chiefly grew on the outsides of the square. We have both specimens of stubble for inspection at our establishment if requested. *Hardy & Son, Seed-growers, Maldon, Essex.*

Corn Prospects of the Coming Year.—As some alarm has been caused by the large rise in the price of Wheat in the last month, it may be satisfactory to show that this rise may be accounted for by the extra demand for seed in the market at this season of the year coming suddenly, and in addition to the usual consumption for food; the latter having wholly to be taken out of the produce of this year—unaided, as it has usually been, by a large stock of old Wheat remaining in the country; and that as this extra demand on the new stock subsides, we are likely to have the markets fully supplied, and to feel the benefit of the late abundant harvest. In addition to the ordinary consumption of Wheat for food in the months of October and November, and which is supposed in Britain to amount to a million-and-a-half quarters a month, there are required in these two months about a million and a half quarters for seed—so that the consumption for this period is increased about 50 per cent. But the extra demand at this season has hitherto had little or no effect on the markets, because we have always had large stocks of old Wheat in the country, in addition to the growth of the last year—and the consumption for food between Michaelmas and Christmas has principally been taken out of the old stock; but this year, owing to the close working up of all old stocks by both millers and bakers, and the absence of any foreign supplies coming in or remaining over in granary, the whole consumption has fallen on the new growth, and the farmers having had little inducement in the price immediately after harvest to thrash out their new growth faster than usual, the markets have been without the additional supply which the deficiency of old stocks has called for. But as soon as this extra demand has been supplied, I feel confident, from the very large crop grown this year of all grain, that the markets will be abundantly supplied, and we shall have less occasion for a foreign supply than we have felt for some years past. From a very careful observation of the crops of corn, both in England and the North of France, I am convinced the growth this year is the largest and finest I have known in the last twenty years, and is at least a fifth more than an average, and probably nearly double the growth of 1853; and if this be so, notwithstanding the absence of old stock to lessen the consumption of new at this season, we shall find the country at Christmas with as much, if not more than our usual stock of home-grown corn, and the present high prices will be but temporary—and I am aided in coming to this conclusion by my knowledge that whilst the produce of Potatoes is considerably greater this year than it has been of late years, at the same time there has been far less of disease in them; and whilst the consumption of Wheat, of late years, has been largely increased by the failure of this root, this year the reverse is likely to be the case. *Hewitt Davis, Oct.* 28, 1854.

Farmers' Clubs.

LONDON, *Nov.* 6.—*Farm Buildings.*—Mr. Bullock Webster, of Malvern, introduced the subject. He said—After having visited nearly all the best farm buildings in England, Ireland, and Scotland, and noted the requirements of farmers in different localities, I have come to the conclusion that partially closed sheds, 18 feet wide in the clear, and not less than 8 feet in height of walls, are capable of being made available for all the purposes, except that of the barn, for which farm buildings are required under the various systems of farming now pursued. Take, for instance, model No. 1, and suppose it required for milch cows, fatting stock, or young cattle. You have a space of 3 feet for the feeding passage, 2 feet for the feeding trough, 6 feet for the animal, 1 foot for the drain, and a 6-foot passage behind, with say 4 feet in width for each animal, as the case may be. Again, should Mr. Warne's system of box-feeding be pursued, this arrangement is equally well adapted to it, the only difference being in the interior fittings. The same holds good if Mr. Mechi's system of gratings for sheep be pursued; and in this case the interior fittings might be moveable, to allow of the conversion of this room for other purposes when not wanted for sheep. In fact, in most cases the interior fittings should be moveable, for the sake of convenience. For stabling, you have but to partition off 6 feet for each horse, or, what might be better, to take in 24 feet of shed; and making your stables crossways, get 6 feet for each of four horses, and a good harness room across the end. For pigsties the plan is equally applicable, through a different arrangement of the fittings. And it will be

easily understood that portions of these sheds partitioned off, or erections of the same dimensions, will answer well for carpenters' and blacksmiths' shops, straw and root houses, gig-house for bailiff, &c.; whilst for shelter for young cattle in the straw-yard the interior wall would be done away with, and posts substituted; and for carts and implements posts substituted in the same manner for the outward wall. I will not attempt to lay down any general rule as to the mode of arranging these 18-feet sheds, as it ought to depend in a great measure upon situation, kind of stock kept, and various local circumstances; but where these make it desirable, I think it will be found practically that three or four 18-feet sheds placed together will form as convenient and economical a covered home-stall as any other kind of erection. One or two remarks, however, I may be allowed to make which, though trite here, may not be inopportune elsewhere. The square or oblong farm is nearly always advantageous. Straw, hay, and roots should be near the cattle, the cart and implement shed near the stable, the piggery near the dairy and boiling-house, the cow-house near the dairy; and there should be but one entrance, which should be near the bailiff's cottage, or the farm-house, so that persons going to and fro may be seen. But, though the exact form of the homestead may be a matter of indifference, or may depend on circumstances, the question as to covered or open homesteads cannot, I take it, be looked upon in that light; for whether we consider the comfort of the animals, and therein their condition for fatting faster and cheaper, or the greater value of unwashed manure, we must, I think, discard in a great measure the idea of the open homestead. (Hear, hear.) For my own part, I decidedly object to covered homesteads opened at the sides, as precluding the proper regulation of the temperature. Any one who has stood under open railway stations on a cold day may have experienced some of the sensations to which cattle are subject under these intended to be comfortable homestalls. (Hear, hear). As the arrangement of the homestead may vary according to circumstances, so also may the materials of which it is composed. Brick or stone will do equally well for the walls, and may be used according to the custom of the neighbourhood. In Norfolk, clay lumps might be substituted; and in districts where there are copper or iron works we shall soon have a valuable building material made from the slagg, which, it is expected, will be brought to such perfection that, in addition to its substitution for brick or stone, it will probably be worked thin enough to supersede slate for roofing. In other districts the roofing may be of slates, or the improved kind of tiles, which latter are warmer in winter and cooler in summer; but I would not recommend the plan of a hollow brick roof, in consequence of the difficulty which there is at present in making it waterproof: though no doubt we shall see improvements in this also. In some districts the iron roofing may be more desirable. Again, the timber may be either of foreign or of home growth; but, I wish it to be particularly noticed, that one of the greatest advantages to the landlord of establishing this 18 feet system of building would be this, that in felling and sawing his timber directions might be given that anything which would cut into rafters, wall-plates, &c., say for 18-feet sheds, should be put on one side and always be ready for the use of the farms on the estate. The saving here effected will be obvious to every one. For floorings for the sheds, I doubt if anything can be found to answer better than hard bricks; I am now using some, which are as hard as stone, perfectly impervious to moisture, and so moulded as to prevent the animals from slipping upon them. There are many other matters of detail, which I do not think it necessary to enter into on this occasion, the main point now, as I conceive, being to decide on some mode of building to be recommended to landlords and tenants generally. The details can be easily filled up. I have, however, thought it might be desirable to give a rough estimate of the cost of 18 feet sheds, as far as the shell, *i. e.*, the walls and roofing, and I caused one to be prepared, showing what would be the cost for 100 feet of shed at the present price of timber, slates, and bricks in the London market. Upon going fully into the matter and getting estimates for tiles, slates, and iron-roofs, in various localities, I find that with walls of bricks and stone, if you take any agricultural district, the expenses per foot in length of these sheds, and including windows and doors, will not exceed 25*s.* per foot. In most places it will not be more than 20*s.*, and where stone or bricks are found for the walls and rough timber for other purposes, it will be only from 12*s.* to 14*s.* In addition, I have only to notice the barn, and as far as my experience goes, I would never build one more than sufficiently large to hold one rick of the size usually made in the locality, with space for the barn machinery and straw. This may be placed at the end or centre of the sheds, as seems best. Thus it would appear, that we have in these 18 feet sheds, a plan of farm buildings adapted for the improved systems of farming of the present day; equally good for any other that may be adopted, whether on a large or small scale; capable of expansion to any extent, easily constructed from the materials to be found in different localities, as inexpensive as possible, in a plain form, and yet capable of great ornament and finish; above all, a plan which if approved by this club and adopted would do more to facilitate the erection of proper homesteads than anything which has yet occurred, by reducing the hitherto uncertain cost to a certainty, and establishing approved ground, on which both landlord and tenant might meet. It will be understood that if 25 more beasts can be kept, 100 feet more shedding will be required, costing 100*l.*; if four more horses, then 24 feet more shedding, and so on; thus leaving no doubt on the score of requirement and expense, the uncertainty of which has, I believe, hitherto deterred hundreds of well-meaning and liberal-minded landlords from building and rebuilding on their estates. With these observations, I will now leave the subject in the hands of the club, believing that most of the members will agree with me that it is high time that something should be done by way of advice and encouragement, to get rid of those straggling, unthrifty, and unsightly farm buildings which are a disgrace to the age in which we live. (Cheers).

Mr. Mechi agreed with Mr. Webster that it must be laid down as a rule that the cattle on the farm should be sheltered, and that open yards like those which had hitherto prevailed could no longer be tolerated, as they were evidently unprofitable. One suggestion which he would venture to make was, that all farm buildings should have a steam-engine, fixed or moveable, in connection with them. The present tendency was, he thought, rather to give up portable engines, and to substitute for them fixed ones, as being the most economical. Then came the question whether the manure was to be removed daily, or to remain under the animals in covered yards, straw being added. He believed the latter practice to be sound, provided there was sufficient ventilation. It was the mischief which arose from bad ventilation that caused farmers in Essex to keep their horses in open yards; and it was well known that where sheds and open yards were combined, there was scarcely any doctor's bill. Ventilation was a point in which he felt very great interest, as he sold, off his farm annually, meat to the value of 2500*l.* His losses of late had been little more than nominal, and this he attributed to the circumstance that there was ample ventilation. As regarded the best method of securing ventilation he thought it ought to be obtained from the bottom rather than the top of a building. He would tell them why he was of that opinion: in his sheds, the floors of which were boarded, he had on a level with the ground a number of 6-inch pipes, placed within 9 inches or a foot from the floor; and it was a singular fact that, while there were large openings above, the smell issued from the lower far more than the upper part of the building. The inference was unmistakeable; and he considered it, therefore, highly important that in stables and cattle sheds, especially such as were made of brick, and therefore impervious to the air, an opening should be made below as well as above, in order that the circulating air might be complete. Another point for consideration was the question of the construction of boarded floors as part of an improved system of farm buildings. He had always entertained a great dislike to boarded floors, as far as comfort and appearance were concerned; but after eight years' experience, he thought the balance was decidedly in favour of boarded floors. (Hear.) He could assure them from that experience that, if they divided a lot of bullocks, keeping one-half on boards and the other half on straw, the butcher, when he came to make his selection, would go first to the bullocks on the boards. It was only that day his butcher had remarked to him that he should always give the preference to sheep fed on boards, as the mutton was of a superior quality; whilst a friend of his, who had been obliged to keep some animals on straw instead of boarded floors, said that his butcher had complained that the meat was not as good as under the latter system. As regarded both sheep and pigs, he (Mr. Mechi) was convinced that boarded floors were best. When he put down his boarded floors, he certainly did not do so with reference to irrigation; but having commenced irrigating, he found he would have been obliged to adopt boarded floors if he had not done so previously, because the manure which fell to-day was, under the boarded system, washed out to-morrow and distributed over the land, so as to enter deeply into the growth of plants. If they kept a large quantity of stock upon heavy clay land it was absolutely necessary that there should be a good covering for the animals during the long winter nights; and the providing of adequate shelter would repay both landlord and tenant. They all knew that, in unfavourable weather, sheep exposed to its influence made no mutton, however much they might consume. (Hear, hear) When they were out, with nothing but wet clay to lie upon, all the carbon of the food went to replace the heat which had been lost through the state of the weather. He agreed with Mr. Webster, that barns should not be used for the future as they had been. In his opinion they should be used chiefly to keep a certain quantity of straw in a dry state, to be cut up as food for animals. He was glad to perceive that they were rapidly approaching a period when the system of cutting up food for animals was likely to be almost universally adopted; and if the great bulk of the straw were consumed together with cake and roots, it would, he thought, be found a most valuable addition to the feeding powers of the farm. (Hear, hear). With regard to the amount per acre which it was necessary to invest in farm buildings, the evidence on the subject was to the effect that for the general purposes of farming, about 5*l.* per acre would suffice. There might, indeed, be some advance on that now that the cost of labour and materials was so greatly increased; but a great deal would of course depend on the circumstances of different localities. If they were to be told that many farmers must keep three times as many cattle and sheep per acre as they did at present, the question arose whether that would not require a larger capital, or the farming of a less quantity of land; and if a larger accommodation was to be afforded than had been provided under the old system, the further question arose, would it pay? In conclusion he would observe that the entire question of farm buildings was a very serious one, dependent in a great degree on the order and character of the farming of different districts. If they were to carry out the great principles which were now forcing themselves on public attention, such as irrigation and large applications of artificial manure for root and green crops, they must have facilities for all this, including, of course, a proportionate amount of capital; but he thought no general rule could be laid down, except that of keeping on the alert and seeking to progress with the progressive character of the times. (Hear, hear.) —Mr. Wood did not entirely concur in Mr. Webster's theory as to an 18-feet building comprising all that was necessary for the accommodation and welfare of cattle, but agreed with Mr. Mechi, that ventilation had a great deal to do with the matter. After a good deal of experience and observation he was of opinion that Mr. Warne's plan of feeding cattle was the best that had been devised. For his own part, however, he did not see the advantage of putting up smart buildings. He had himself begun by making an excavation of about 2 feet, and then sticking posts in the ground. He afterwards employed a carpenter at 2*s.* a day (Oh, oh!), after which he got a few rails, and put on the plates and the roof; and when he had tied the whole strongly together, he found that it answered his purpose just as well as though he had gone more expensively to work. He could build boxes to any extent for about 6*l.* or 7*l.* each. They would last for a 14-years' lease, and the total cost was not more than the interest of the money laid out in constructing expensive buildings; while at the end of 14 years he would be in a position to set five to the buildings and erect others, without being more out of pocket than those who built a box at a cost of 15*l.*, which according to them was to last for ever. (Laughter.) He had, too, the advantage of good ventilation, through not putting up brick walls. On one occasion, indeed, he did erect a 4-inch brick wall, but he found that the animals kept inside were not so healthy as they otherwise would have been. There was not that escape of effluvia which he considered necessary to keep them in good condition. His plan was to put up bushes, and there could be no more complete ventilation than those afforded. (Hear, hear.) It was a well-known axiom in Sussex that, if a gust of wind once got into a bush-faggot, it never came out again. (Laughter.) This was, in fact, a most wholesome system of ventilation, and, leaving expense out of the question, he considered the kind of building which he had just described preferable to the most substantial one that could be erected. He had 20 bullocks in boxes of that description during the whole of last summer. If the box system was to be carried out they must have ventilation, and in no other way could they get such perfect ventilation as was secured by putting up bushes. As regarded expense, they were aware that though surveyors and clever men might make what appeared reasonable estimates for buildings, there were often many things left out of their calculations, as those who had to pay discovered to their cost. There were, for instance, the charges for making shoots and roads, and for providing sheds for horses, carriages, and so on; with reference to which there was perhaps no more convenient plan than that of having a shed, or a number of sheds, 11 feet in the clear. He did not approve of putting sheep in sheds; he had tried it, and found that it did not answer. The great advantage of feeding sheep on the land, instead of under cover, was that the manure was left where it was required, and the expense of carrying it was avoided. As to the flock farmers of Hampshire and Wiltshire housing all their sheep, it would be useless to attempt it. He thought it desirable that the buildings which already existed on farms should as far as possible be turned to account. (Hear, hear.) He had endeavoured to turn his own to account by putting shoots round them; while by means of boxes he had in some cases been enabled to dispense with the use of shoots. It was doubtful whether in many cases in which large buildings were erected the tenants would be able to pay the interest of the money expended. (Hear, hear.) As to barns, it was to be remembered that farmers were now nearly all threshing with steam-engines, and he believed that practice would become still more extensive, and that barns would therefore be less needed for threshing purposes. The system of carrying to barns would, he thought, soon be almost discontinued.—Mr. Trethewy perceived that Mr. Webster's model allowed only one barn. He was no advocate for having a great deal of barn space, but he thought that one single barn in the case of a farm of two or three hundred acres would not be sufficient. Again, as regarded height, he thought the model building was of too low an elevation. He agreed with Mr. Wood as to the adaptation or renovation, as it were, of old buildings, and thought that in many cases it would be much more desirable and easy to take advantage of existing buildings, and to turn them to account in the best manner practicable, than to erect new homesteads. In conclusion, he could not help reiterating his doubts that the accommodation spoken of by Mr. Webster could be provided for the sum stated by him.—Mr. Oakley said that agriculturists ought to feel much obliged to Mr. Webster or any one else who brought forward a question of this nature; for there was nothing so costly to the landlord as the reparation or renovation of old buildings and the erection of new ones, and at the same time nothing so beneficial to the tenant as the having suitable places to shelter and feed his animals. He had had a great deal to do with the alteration of old buildings, so far as they were available, and the erection of new ones where that was necessary, and for that purpose had been entrusted with the spending of a great deal of other people's money. The plan he had adopted for the erection of covered homesteads was that of Mr. Beadel's, and the idea of doing so first came into his mind through his intercourse with friends in the Weald of Sussex, who discovered in their box-feeding, that the manure thus obtained, which they applied in their Hop cultivation, was much more beneficial than manure which the water of heaven had been falling upon. His object had been to keep all the animals covered under one roof, while at the same time he made due provision for ventilation. As the discussion of that evening turned upon the question of economy in relation to farm buildings, he wished to remark that his experience led him to this conclusion—that, taking the price of timber at what it was in 1851 and 1852, in the case of a farm of 300 acres of mixed land, such land as abounded in Herefordshire and Worcestershire, farm buildings might be erected suitable to the accommodation of 40 beasts, 40 pigs, 12 horses, a gig-house, poultry-house, &c., at a cost of 1000 guineas, which was as nearly as possible 3*l.* 10*s.* per acre. His views on the subject were published in the Journal of the Royal Agricultural Society of last Christmas. There was an advantage as regarded expense in having one roof instead of five or six roofs. On this point, however, he must remark that it would make a material difference if they had leaden gutters. In that case, to talk of 25*s.* a foot would be idle.—The chairman said, Mr. Cook, of Semer, had some very excellent covered farm buildings. He proceeded in the most economical manner, and his buildings were better adapted to the purpose than any others which he had seen. It happened that in all the buildings of this description which he had visited there was some defect. Some were built too high; and he had himself observed a driving wind and rain beating across half the building; others were too low, and there was not that amount of ventilation which was requisite for the health of the animals. The grand point was so to shelter animals at particular seasons as to secure the best quality of food. Mr. Cook, of Semer, had made nearly all the buildings already erected serve for sides to his covered yards, and he would recommend those persons who wished to improve their farm buildings to go and inspect those of Mr. Cook. On a considerable farm in Essex—a farm of 400 or 500 acres—of which he was entrusted with the management, the buildings were not long since all burnt down. They were insured for 1000*l.*; and the owner of the farm having placed that amount in his hands, requested him to erect with it such farm-buildings as were required, telling him at the same time that he should not pay any more. With that sum he (Mr. Baker) erected an excellent homestead. The sheds were 160 feet in length and 40 feet in width, and included two large barns, a large building for a steam-engine, and ample accommodation for cattle and horses; while the height in front was 9 feet clear. What he would recommend to landed proprietors desirous of improving their farm-buildings was, that they should take the advice of some person who was competent to give advice, and to point out to them the best method, whether of converting buildings which already existed, or of setting about the erection of new buildings, and not to proceed without knowing what was required, or within a thousand pounds what expense was likely to be incurred.—Mr. Webster having briefly replied, on the motion of Mr. Mechi, seconded by Mr. Trethewy, the following resolution was adopted unanimously:—"That this club is of opinion that covered homestalls are strongly to be recommended, whenever they can be introduced with advantage; but it is further of opinion that no settled plan of farm-buildings can be laid down, as different circumstances of obtaining materials, adaptation of present buildings, and the actual requirement of the farm, must at all times call for a different application."

Notices of Books.

The Farm Almanac for 1855. By C. W. Johnson, Esq., F.R.S., and W. Shaw, Esq. J. Ridgway, 169, Piccadilly.

THE same quiet useful substantial little volume as it has always been. This is what it is intended to be, a word of praise—one, too, which has annually been fully earned; but it is what it is also intended to be, a bit of criticism too—for we think the numerous readers of this work would be gratified and *benefitted* by a little variation from the sober and somewhat monotonous character which it has acquired—by a little more vigorous assertion of the forward movement which agriculture certainly

is making, and a rather less constant reference to what everybody knows or ought to know, for the volume is purchased rather by farmers than by farm pupils. At the same time we are sure that we express the general feeling of the agricultural community, in thanking Mr. Johnson for his useful persevering labour in this and in the many other channels through which he has benefitted English agriculture.

Miscellaneous.

Means of Removing the Rancidity of Butter.—Wild recommends that the butter should be kneaded with fresh milk, and then with pure water. He states, that by this treatment, the butter is rendered as fresh and pure in flavour as when recently made. He ascribes this result to the fact, that butyric acid, to which the rancid odour and taste are owing, is readily soluble in fresh milk, and is then removed.—*Quoted in the Pharmaceutical Journal.*

Calendar of Operations.

NOVEMBER.

CHESHIRE, *Nov.* 7.—For the last month the farmers generally have been busily engaged in preparing for and sowing their Wheat, the greater portion of which has been put into the ground in the best possible condition; there is, however upon the dry soils, and more especially upon the Turnip land, a considerable quantity yet to sow, but should the weather continue tolerably fine for a fortnight longer, in that also we may expect great progress to be made, and we think a full average quantity will be sown during the season. The yield of the last crop of Wheat appears to be satisfactory, and the price, although rather lower within the last week, is also considered remunerative. Very little Barley has been threshed, or indeed of Oats; therefore much cannot be said of those crops, but it is feared that Barley will not prove an even sample, or very productive. Winter Vetches have engaged the attention of the farmers in an unusual degree, in consequence of the deficiency of the hay crop and expected scarcity of spring food for cattle, and the demand for seed has greatly exceeded the supply, which has caused the price to be very high. It is much to be regretted that the opinion formed a few weeks ago with regard to the productiveness of the Potato crop, has undergone a great change; many crops which at the time of being raised had comparatively a healthy appearance, are, on their final removal to the "hay" for the winter, found to contain at least 20 per cent., and in some instances as much as 30 to 40 per cent. of diseased Potatoes; consequently the price has risen materially in the market, and is likely to be much higher before the spring months. The season has been very fine for pulling, and storing Mangold Wurzel and the crops generally are found to be much superior to the Turnip crop, which is almost invariably the case in dry hot seasons like the last. Turnips are still growing, but they never can recover from the effects of the mildew, which has been so prevalent, especially amongst early sown ones. Fat cattle and sheep are very scarce, and the price of beef and mutton is likely to advance considerably before Christmas. Pigs are also in good demand. *W. P.*

WESTER ROSS, 14*th Nov.*—The weather having continued favourable since our harvest was concluded, Wheat sowing is now well advanced, farther, perhaps, than it has been at this season for years; and a more suitable bed it could scarcely have been cast into. The first sown is already making its appearance regular and vigorous. All just now bids well for next year; a large breadth sown, and that in the best condition. Although at the risk of being smiled at by not a few of your readers and correspondents, we readily acknowledge that we have not yet arrived at the conclusion that 2 or 3 pecks, or even a bushel, is seed enough for an acre, in the far north of Scotland. Sometimes we have had hardihood enough to try a smaller quantity than usual, led astray by general, and consequently reckless assertions, because only applicable to exceptional cases; but our experience has invariably been, that we had a lightness of labour in harvest in beautiful keeping with the diminution of seed. Let those who are fortunate enough to dwell in a climate so genial, and to cultivate soil so rich as to require only a few pecks of seed, be thankful; and surely, better far that these same fortunate ones, instead of talking as if every farmer were equally fortunate with themselves, should commiserate the condition of those who find it necessary to sow some 3 or 3½ bushels per acre, and who, besides, are under the necessity of carefully watching that from the devastation of crows and all such pests. With a return of 10 bushels of Wheat for each one sown, as many of us have this year, and receiving for each bushel well nigh 9*s*, we fall little short of the contentment necessary to keep us from envying the man who can do with 2 pecks of seed. Essex seems still the favourite Wheat for good soil. Red-strawed was pretty largely sown last year, but our bakers raised such a shout of condemnation (many suppose a mere whim) that less of it will be sown this year. On lighter soils red Wheat is now more generally sown, and this year large returns are spoken of, so much as 7 and 8 quarters an acre. A good deal of the new crop has been already threshed, and gives general satisfaction, both as to quantity and weight, although there is a larger quantity of dressings than usual, the result of little sunshine, damp, and rust. The weight ranges from 61 to 66 lbs. per bushel. The price being high, all that is threshed seems to go direct to market. Our Muir of Ord markets are over for a season. Demand continued brisk, and prices exorbitant to the end. The weather is particularly suitable for sheep on Turnips, and they thrive apace. The continued agricultural prosperity has caused to settle on the farmer's countenance a grateful smile; and I have no doubt but that it will take many days of sad adversity again to dislodge it.

Notices to Correspondents.

BONES IN CHESHIRE: *Enquirer.* The "boning" in Cheshire is generally done by scattering 3 or 4 quarters of coarse bone-dust broadcast per acre over the Grass lands. It is a rough and wasteful process.

BOOKS: *H M W.* Andrews' "Modern Husbandry" is published by N. Cooke, Milford House, Strand. For our opinion of it see p. 189 of this year's volume.—*H L.* Professor Lowe's works, Blackie's "Cyclopædia of Agriculture," Stephens' "Book of the Farm," "Spooner on the Sheep," U. K. Society's books on Horse, Ox, and Sheep.

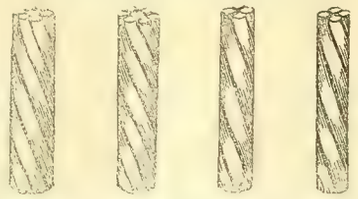
FRESH MEAT: *A Subscriber* writes:—It is said that beef can be preserved fresh for some weeks by being in contact with carbonic oxide, and it would be a favour if directions were given for applying it; the quantity to be used for a given quantity, say a stone of beef.

POULTRY: *Anon.* By all means select the cock which you describe as having the tail feathers of a "greenish black" colour slightly edged with white; what you consider a defect we are inclined to pronounce quite the reverse. The comb of the cock bird is as you suppose too "wide;" it should not be *more* than an inch.

SEEDS FOR CANADA: *H L.* Apply to Messrs. Gibbs, or to any of the great seedsmen. See our advertising columns. For mildew on Turnips—sow late, and aim, by cultivation, to maintain uniform and continuous growth.

SPANISH POTEIRON: *H L.* We do not know it.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

POULTRY, RABBIT, SHEEP, AND CAT FENCING. Hare or Rabbit Nets, on Cords, for Covert Shooting, 12 mesh over, 4 feet wide, 1½*d.* per yard.; 18 mesh over, 6 feet wide, 2½*d.* per yard; 24 mesh over, 8 feet, 3*d.* per yard; each Edge Corded, ½*d.* per yard extra; extra Stout ditto, 18 mesh wide, 4*d.* per yard, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing against fowls, cats, &c., at W. CULLINGFORD'S, No. 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

CHEAP WIRE GAME AND POULTRY NETTING.

	PLAIN.	GALVANISED.
24 inches wide, 2-inch mesh, 3*d.* to 4*d.* per yard.		6*d.* per yard.
36 inches wide, 2-inch mesh, 6*d.* per yard.		9*d.* "
48 inches wide, 2-inch mesh, 9*d.* "		1*s.* 0*d.* "

Sparrow Proof Netting, galvanised, 3*d.* per square foot, made to any size. This article is shown at the Sydenham Exhibition, where it is much admired.

W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, near the Gate, Kingsland, London.

NETTING FOR SHEEPFOLDS, made of Cocoa-nut Fibre; a material known to possess the most extraordinary durability when exposed to the alternations of weather. It will wear out several sets of tarred hemp netting, and is so light that a herdsman may with ease carry 200 yards of it. Price 4*d.* and 6*d.* per yard. Sold in Nets of 50 and 100 yards long, 48 inches high, by the Manufacturer, W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

WIRE FENCING, 6¾*d.* per square yard, in various widths, from 6 feet to 15 inches, mesh less than 2 inches. An effectual fence against Hares, Rabbits, Sheep, Deer, &c., and for the enclosure of Poultry, Pheasants, &c. 4-inch mesh, 4*d.* per square yard.
R. RICHARDSON, 21, Tonbridge Place, New Road, London.

GARDEN NETS, FISHING NETS, SHEEP NETS, AND RABBIT NETS, made by Machinery, and supplied at very low terms. Samples sent free.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide. 1*s.* per yard run—admits light and excludes cold; thick Canvas Tarpauling, 1*s.* per square yard; thick Canvas Waxed Sheeting, 1*s.* per square yard, may be had various widths. These Canvases are excellent for roofing Sheds and Outhouses, as they are quite waterproof.—R. RICHARDSON, 21, Tonbridge Place, Judd Street, New Road, London. N.B. Waterproof Capes, large size, 3*s.*; Police Capes, 18*s.* and 24*s.* per dozen; Driving Aprons, Capes, and Coats of India Rubber, Horses' Loin Cloths, Waggon and Cart Covers, Sacks, &c.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, ENGINEER, Battersea.

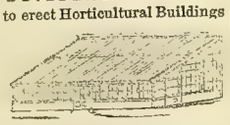
GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

HORTICULTURE IN ALL ITS BRANCHES.

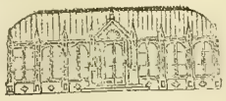
J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.



The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.
J. WEEKS & Co., King's Road, Chelsea, London.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

6 in. by 4 in. to 6 in. by 5½ in. ...	13*s.* 3*d.*
7 by 5 to 8 by 6	13 6
8½ by 6½ to 10 by 8	14 0
10½ by 8½ to 14½ by 10½	16 0
17 by 10 to 18 by 12	18 0

per 100 feet.

A great variety of sizes. Particulars had on application.

ORCHARD HOUSE SQUARES on Mr. RIVERS'S plan, to whom I have sold some thousands of feet.

Large Sheets for cutting up, in cases, at 2½*d.* and 3*d.* per foot.

HARTLEY'S IMPROVED ROUGH PLATE GLASS, Sheet, and Rough Plate, Tiles, Milk Pans, Bee and Propagating Glasses, Wasp Traps, Cucumber Tubes, Preserve Jars, with and without covers; Fern Glasses.

Plate, Sheet, Crown, and Ornamental Window Glass. Crystal Glass Shades for ornaments.

Greenhouses, erected in either wood or iron. Garden Lights and Frames.

87, Bishopsgate Street Without, London—same side as Eastern Counties Railway.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

Packed in Boxes of 50 feet each.

6 by 4 and 6½ by 4½	10*s.* 6*d.* per box.
7 " 5 " 7½ " 5½	12 0 "
8 " 6 " 8½ " 6½	13 6 "
9 " 7 " 9½ " 7½ and 10 by 8 ...	15 0 "

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2*s.* each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,
116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, 296, Oxford Street, London.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt.

HARTLEY'S PATENT ROUGH PLATE, for Roofing Conservatories, Halls, and Public Buildings.

PLATE, CROWN, and SHEET WINDOW GLASS.

Coloured and Ornamental Glass of every description.

Glass Milk Pans, Pails, Tests, and Measures; Cream Pots and Syphons; Churns, Butter Tests and Slabs; Tiles and Slates; Bee Hives, &c.

Moore's Patent Ventilator and Lockhead's Patent Perforated Glass, for Dairies and Greenhouses.

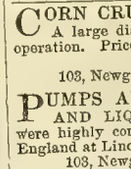
Aquavivariums, Fern Shades, Propagating Glasses, Fruit Protectors, Preserve Jars, Cucumber Tubes, Hand Lights, Flower Vases, Labels, &c., and all kinds of Agricultural, Horticultural, Architectural, Domestic, Scientific, and Ornamental Glass, British and Foreign, at the lowest prices.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

ALFRED KENT'S PATENT WEATHER-PROOF GLAZING WITHOUT PUTTY.—For Horticultural Buildings in Wood or Metal.
HORTICULTURAL BUILDING WORKS, CHICHESTER.

Illustrated Books describing inventions, containing prices and particulars relating to the different designs, sent on receipt of four postage stamps. Nurserymen and others appointed agents on application.

Horticultural Buildings upon this plan having been erected in many different parts of the country, and having stood the trial of all weathers, and more especially the severest of all, viz., frost, A. KENT, with full confidence, strengthened by the many flattering testimonials he has received, can safely guarantee the proper working of his Patent System of Glazing. Estimates and Plans sent, including Heating by Hot Water.



TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING or SALTING MACHINE for GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

THE PATENT SPRING SHAFT CART and SAFETY CAR.—This vehicle is admirably adapted for the use of country gentlemen, farmers, emigrants, and sportsmen, for whose purposes it will be found superior to any yet introduced, being simple in structure, easy of draught, roomy, light, and safe.

As a family car or chaise cart to convey persons, luggage, &c., or as a sporting or dog cart, its advantages consist in the great number and weight it will carry, its safety in a hilly country, its ease of draught, and the facility it affords, to ladies especially, for getting in and out.

As a Tradesman's, Colonial, Emigrant's, or Farmer's Cart, it is well adapted for the carriage of Implements, Stock (such as calves or lambs), and goods of all kinds.

The peculiarity of the Spring enables it to be applied, without expense, to any ordinary Farm-cart. Specimens of each description may be seen at the Maker's, T. B. AYSHFORD, 56, Drury Lane, London; and will be exhibited at the Smithfield Club Agricultural Show in Baker Street, by Mr. WILLIAM PIERCE, Agricultural Engineer, 73, Mark Lane, City, from whom all information and full particulars may be obtained.

THE COMFORT of a FIXED WATER-CLOSET for 1*l.*—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square.

DR. DE JONGH'S

LIGHT BROWN COD-LIVER OIL, PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS. PRESCRIBED BY EMINENT MEDICAL MEN AS THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, RHEUMATISM, SOME DISEASES OF THE SKIN, RICKETS, INFANTINE WASTING, GENERAL DEBILITY, AND ALL SCROFULOUS AFFECTIONS —EFFECTING A CURE OR ALLEVIATING SUFFERING MUCH MORE RAPIDLY THAN ANY OTHER KIND.

Testimonial from the late DR. JONATHAN PEREIRA, *Professor at the University of London, Author of "The Elements of Materia Medica and Therapeutics, &c.*

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod Liver Oil. It was fitting that the Author of the best analysis and investigations into the properties of this Oil should himself be the Purveyor of this important medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the oil of which you gave me a sample; because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to your application. The oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours, (Signed) "JONATHAN PEREIRA,

"To Dr. de Jongh." "Finsbury Sq., London, Ap. 16, 1851.

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by

ANSAR, HARFORD, AND CO., 77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and the British Possessions, and may be obtained from respectable Chemists and Druggists in town and country, at the following prices: IMPERIAL MEASURE, half pints, 2*s.* 6*d.*; pints, 4*s* 9*d.*; quarts, 9*s.*

*** Four half-pint bottles forwarded, CARRIAGE PAID, to any part of England on receipt of a remittance of Ten Shillings.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, use Miss GRAHAM'S NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers it has no equal. Price 2*s.*, sent post free on receipt of 24 penny postage stamps, by ELLEN GRAHAM, 3, New Road, Hornsey, Middlesex.—"My hair is quite restored." Miss ORME.—"I have a full pair of Whiskers, thanks to Nioukrene." H. ROBB, Esq.—"It has checked the greyness." Mrs. JONES.—Beware of imitations: it can only be procured from the above address.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, MOUSTACHES, &c.?—ALICE MELVILLE'S PALMAPILLA in all cases strengthens weak hair, prevents its falling off, checks greyness, produces a thick and luxuriant growth, dispels scurf and dandriff, and makes it clean, soft, curly, and brilliant in appearance. For baldness from any cause it is certain and effective; and for the production of Whiskers, Moustaches, Eyebrows, &c., in three or four weeks, it can be fully depended upon. Price 2*s.*, sent post free (anywhere) on receipt of 24 penny postage stamps, by Miss MELVILLE, 25, Argyle Square, King's Cross, London. —"My whiskers are growing very thick." R. Mede, Esq.—"It restored my hair, which I had lost in patches." W. Sturt.—"It has quite checked the greyness." Miss Ellis.—"My Moustache is greatly improved." Capt. Ross.

SOUND and WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as highly conducive to health and longevity. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTIFRICE, stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, it will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the teeth firmly in their sockets; and from its aromatic influence imparts sweetness and purity to the breath.—Price 2*s.* 9*d.* per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by chemists and perfumers.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

NOW IN SEASON.

FORD'S EUREKA COLOURED SHIRTING is now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.

FORD'S COLOURED EUREKA SHIRTS, Six for 27*s.*

FORD'S WHITE EUREKAS, best quality, Six for 40*s.*; second quality, Six for 31*s*; if washed ready for use, 2*s.* extra.

CAUTION.—Ford's Eureka Shirts are stamped, "38, POULTRY, LONDON," without which none are genuine.

*** Catalogues with particulars post free.

RICHARD FORD, 38, Poultry, London.

KNOW THYSELF.—Persons desirous of knowing the gifts, defects, talents, tastes, affections, and other characteristics of themselves or any friends in whom they are interested, must send a specimen of the WRITING, stating sex and age (including 13 penny postage stamps) to Miss GRAHAM, 3, New Road, Hornsey, Middlesex, and they will receive a minute graphiological delineation, written in a style peculiarly her own. —Testimonial from W. R. "Having seen several of your portrayals of character, and being much struck with the forcible truths contained in them, I should like your opinion of mine."—Miss H S. "Your delineations are most faithful."—Miss Grove. "Your letter gave great satisfaction."—Miss Rosa C. "Accept my sincere thanks for your advice. I was exceedingly doubtful of him."

BLAIR'S GOUT and RHEUMATIC PILLS Price 1*s.* 1½*d.* and 2*s.* 9*d.* per box.—Mr. William Courtney, of Barton Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and give a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1*s.* 1½*d.* per box.—Observe that "THOMAS PROUT" is on the Government stamp.

HOLLOWAY'S OINTMENT AND PILLS EFFECTUALLY CURED A DREADFULLY SORE HAND. —Mrs. Lyon, of 35, Whitecross Place, Wilson Street, Finsbury Square, suffered fearfully from an abscess in the hand, which for some months was rendered perfectly useless, she had the best advice of medical men in the neighbourhood and underwent various operations of the lancet without obtaining relief. After this she tried Holloway's Pills and Ointment, which in a brief space of time effected an excellent cure, and she has now the free use of her hand, showing in this case, as well as in many thousand others, these invaluable remedies are pre-eminent.—Sold by all Vendors of Medicine, and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

ASTHMA, COUGHS, COLDS, and INFLUENZA speedily cured, and instantly relieved, by the use of SPENCER'S PULMONIC ELIXIR.

This fine medicine will be found admirably adapted to promote expectoration, ease the breathing, loosen the phlegm, abate fever, and allay the tickling sensation which occasions the cough, without tightening the chest; and for all temporary and local affections, such as wheezing, irritation of the throat, palpitation of the heart, hoarseness of the voice, influenza, &c., it affords immediate relief; while in more chronic disorders, as periodical coughs or inveterate asthma, it is equally valuable in its effects, although of course a little longer perseverance in the use of the article is required.—Prepared only by T. Roberts and Co., Crane Court, Fleet Street; and sold by E. Edwards, 67, St. Paul's Churchyard; Barclay and Sons, Farringdon-Street; Sutton and Co., Bow Churchyard; Sanger, and Hannay and Co., Oxford Street; and by all respectable medicine-vendors and chemists in the kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each; the bottles at 2*s.* 9*d.* contain nearly as much as three small ones.

*** Ask for SPENCER'S Pulmonic Elixir.

VALUABLE REMEDIES FOR THE AFFLICTED.

DR. ROBERTS'S Celebrated Ointment, called the POOR MAN'S FRIEND, is confidently recommended to the Public as an unfailing remedy for wounds of every description, a certain cure for Ulcerated Sore Legs, if of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples on the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1*s.* 1½*d.* and 2*s.* 9*d.* each.

Also his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience to be, without exception, one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are used in Scrofulas, Scorbutic Complaints, Glandular Swellings, particularly those of the neck, &c. They form a mild and superior Family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 22*s.* Sold Wholesale by the Proprietors, Beach and Barnicott, at their dispensary, Bridport; by the London houses. Retail by all respectable Medicine Vendors in the United Kingdom.

Observe.—No Medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott, late Dr. ROBERTS, Bridport," is engraved on the Government Stamp affixed to each package.

AGRICULTURAL TUITION.—Sons of Gentlemen received as Agricultural Pupils into the family of a Clergyman occupying a Farm, cultivated under the Improved System, 25 miles from London.—Address Rev. C. C., Office of this Paper.

A LAND AGENT, in Suffolk, has a VACANCY for a young GENTLEMAN desirous of learning AGRICULTURE. He would have the opportunity of seeing practical farming at home, the advantage of taking the tillage account, and seeing everything connected with the general management of an estate 11,000 acres in extent. May be instructed in land surveying, mapping, and levelling. Terms 100 guineas per annum. —Apply to Mr. HUNT, 12, Tavern Street, Ipswich.

NERVES.

DR. GRANDISON'S PILLS for strengthening the Nerves are sold in London by Mr. RICHARDS, 40, New Bridge Street; Mr. SANGER, 150, Oxford Street, and other respectable Chemists. Boxes can be sent by post.—Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 4*s.* 6*d.* each.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

TO FLORISTS, FRUITERERS, & GREENGROCERS.

TO BE LET, a BUSINESS in the above line, within 4 miles of town; capital Shop, Conservatory, and Greenhouse, all in excellent working order. The situation is highly respectable, and for a clever man it is a most desirable opportunity. Coming-in moderate.—For particulars apply to Mr C. BROWN, House and Estate Agent, Westcroft Place, Hammersmith.

TO GARDENERS.—A very favourable opening presents itself to any nobleman's or gentleman's Gardener wishing to enter into business as a GARDENER and FLORIST. The situation is in one of the very best neighbourhoods round London, and the in-coming would be easy.—Address X. X., Office of the *Gardeners' Chronicle*.

MONMOUTHSHIRE.

TO BE LET, for a term of years, and entered upon at Lady-day next, the FARM of LLANVAIR GRANGE. It consists of 164 acres of rich productive Land, of which 4 acres are in Orchard, 76 in Meadow and Pasture, and 84 are Arable. There is a comfortable Farm-house and Garden, Dairy and Cheeseroom, and ample Farm Buildings on the Farm. It is within a short distance of the Pontypool Iron Works; there is a station on the Newport and Hereford Railway close by. At the Iron Works there is a constant demand for every kind of Farm produce. The proprietor at Llanvair Grange will direct some one to show the Farm; and for particulars apply to Mr. JOHN MORTON, Morningside, Nail-worth, Gloucestershire.

TO BE SOLD, upwards of 50 CLOCHES (used in France for raising early Salads).—Enquiries may be addressed post-paid to A. B. C., Ashley, near Stockbridge, Hants.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

Sales by Auction.

FANCY POULTRY.—PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, November 21st, at 12 o'clock precisely, a CHOICE SELECTION OF POULTRY, from the yards of F. ROSES, HOLLYHOCKS, ETC.

ROSES to force, or to form beds at once. See S. WALTERS'S ADVERTISEMENT, page 706.

EXHIBITION OF CHRYSANTHEMUMS.—A large Collection of the above is now in flower at CHANDLER & SONS' Nursery, Wandsworth Road.
Good flowering Plants, 6*s.* to 12*s.* per dozen.

LARGE EVERGREENS.—Gentlemen planting may procure at CHANDLER AND SONS' Nursery, Wandsworth Road, fine large bushy EVERGREENS, viz, China Arbor-vitæ, Hollies, Box, Laurels, &c., at very moderate prices.

CAMELLIAS.

CHANDLER AND SONS beg to inform their friends and customers that they have a large stock of young Camellias this season, beautifully set with flower buds, and now in a fit state to travel without injury. Fine bushy plants, 30*s.* and upwards per dozen.—Wandsworth Road, Vauxhall.

NEW CHRYSANTHEMUMS.

JOHN SALTER'S collection, containing all the established favourites, and upwards of 60 new varieties of this season, is now in bloom, and may be seen every day except Sunday.—Versailles Nursery, William Street, near Hammersmith Turnpike.

TO BE SOLD, at very reduced prices, 10,000 very strong 2, 3, and 4-year old GOOSEBERRIES and CURRANTS, of the best sorts.—For further particulars, apply to LAKE & DYER, Nurserymen, Bridgewater.

TO MARKET GARDENERS AND OTHERS.

TO BE SOLD IMMEDIATELY, 1500 GOOSEBERRY and CURRANT TREES, 16 PEACH and NECTARINE, 15 MORELLO CHERRY (trained), 6 PLUM, 1000 RASPBERRY CANES, large quantity of STRAWBERRY RUNNERS, all in bearing condition, for 10*l.*, owing to the proprietor going abroad.—Enquire of W. BECKETT, Wanstead, Essex.

TO BE SOLD, a quantity of STANDARD PEARS and PLUMS, of the best kinds, and fine trees, at 20*s.* per dozen, or 7*l.* 10*s.* per hundred.—J. SMELTON, Nurseryman, &c., Earl's Court, Brompton, London. N.B. Country orders attended to on a remittance by post.

SEED WHEAT.—Samples and Prices of RED HYBRID, NURSERY, and other kinds of Wheat from the CHALK, sent on application to Mr. H. RAYNBIRD, Basingstoke.
The Red Hybrid and Nursery are well suited for late sowing after Turnips.

WANTED, One Thousand Strong YEWS (English), not less than 4 feet in height.—Address, with lowest price, JOHN WIGHTMAN, Gardener to Sir R. Peel, Bart., Drayton Manor, near Tamworth.

SPECIMEN IRISH YEWS.

THOMAS JACKSON AND SON having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

8 to 9 feet high, and 8 feet in circumference			...	63*s.* 0*d.*	each.
8	„	and 4 to 5 feet	„	... 21 0	„
7 to 8	„	and 4 feet	„	... 15 0	„
6 to 7	„	and 3 to 4 feet	„	... 10 6	„
6	„	and 3 feet	„	... 7 6	„

Handsome smaller specimens at proportionately lower prices.
Kingston, Surrey.

JAMES MELDRUM, NURSERYMAN, Kendal, Westmoreland, begs to offer, upon the most reasonable terms, upwards of one million of fine stout two-year SEEDLING OAKS, and also two-year SEEDLING ASH.—Price on application.

DWARF PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

EDWARD PARKE FRANCIS offers a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application. Strong Trees, showing Fruit Buds, 2*s.* 6*d.* to 3*s.* 6*d.* each.
Rose Nurseries, Hertford.

FOREST TREES.

J. DICKSON AND SONS, NURSERYMEN, Edinburgh, beg respectfully to call the attention of their Patrons and the Public to their extensive and fine stock of FOREST TREES, &c., Priced Lists of which may be had on application.
All Orders promptly executed, and delivered in London free of expense.—32, South Hanover Street, Nov. 25.

LARGE FIRS AND FOREST TREES.

MESSRS. WILLMOTT AND CHAUNDY, of Lewisham, have to dispose of, at low prices, in consequence of the ground (12 acres) having to be cleared for building on, a quantity of large FOREST TREES and FIRS of various kinds; they will come up with good roots.
They have also an extensive stock of large well-grown Evergreens of various sizes, that will come up with good balls.

HYACINTHS FOR BEDS.

FRESH IMPORTED HYACINTHS, all double, colours marked, at 30*s.* per 100, carriage free. Fine mixed CROCUSES, 12*s.* 6*d.* 1000; and other DUTCH ROOTS at equally low prices.—JOHN SUTTON & SONS, Reading, Berks.

SUTTON'S EARLY CHAMPION PEA, WAITE'S DANIEL O'ROURKE, SANGSTER'S No. 1, FAIRBEARD'S NONPAREIL, *and all other new sorts of Seeds, may be obtained genuine, by retail, at the Grower's retail prices, from*
SUTTON & SONS, Seed Growers, Reading, Berks.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

NONPAREIL PEAS.

WILLIAM FAIRBEARD begs to inform the trade that he is now ready to execute any orders he may be favoured with. This Pea W. F. is confident will become a general favourite both for Garden and Field culture. Price can be had on application.—Mount Pleasant Nursery, Queen Street, Sittingbourne, Kent.

OMER PACHA PEA.

W. NICOL, GARDENER, Roslyn House, Hampstead, begs to announce that he has put his incomparable Pea "OMER PACHA" into the hands of Mr. SOMMERVILLE, Landscape Gardener, Nurseryman, &c., Garden Road, St. John's Wood, London, for Sale in sealed quarts at 10*s.* 6*d.*; and pints, 7*s.* 6*d.* The above Pea is not only the earliest, but the most prolific and best-flavoured hardy variety in cultivation. As the Stock is small, W. NICOL would recommend immediate application to Mr. Sommerville, as above.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s.* per lb., smaller quantities 2*s.* 6*d.* per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

HOLLYHOCK SEED.

R. PARKER has now ready for sending out Seed of this year's saving from the finest named varieties in cultivation, in packets at 1*s.* and 2*s.* 6*d.* each. A remittance or reference to accompany all orders from unknown correspondents.—Paradise Nursery, Hornsey Road, London.

CUCUMBER SEEDS.—The finest sorts in cultivation—Bozman's MODEL of PERFECTION and CALIFORNIA (warranted true), at 8*s.* per 100 Seeds.—Apply to GEORGE OCKLESTON, Blackburn, Lancashire.

CHRYSANTHEMUMS.

J. AND J. FRASER have now in bloom a very fine collection of the above, comprising the best of Pompone and large flowering varieties. Fine strong plants in bloom, from 9*s.* to 12*s.* per dozen. Several new varieties of the present season, 1*s.* 6*d.* each.—Lea Bridge Road, Essex. Nov. 25.

FINE SPECIMEN PLANTS.

J. AND J. FRASER beg to invite attention to their magnificent Collection of large AZALEAS, HEATHS, and other Plants, which were never in such good condition as at the present time. This is an excellent opportunity for buyers, as (on account of not having sufficient room) the plants will be offered at very low prices.
The Nursery, Lea Bridge Road, Essex.—Nov. 25.

PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

J. AND J. FRASER have to offer a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application. Strong Trees, showing Fruit Buds, 2*s.* 6*d.* to 3*s.* 6*d.* each.
Lea Bridge Road, Essex, Nov. 25.

PYRAMIDAL PEARS.—In addition to the large stock of this description of Pears on Quince stocks, a large collection of fine trees, five and six years' old, 5 to 6 feet high, on Pear stocks, twice and thrice removed, at 3*s.* 6*d.* each, can be furnished. A list of sorts, with descriptions, is given in the Supplement to Catalogue of Fruits, just published.
THOMAS RIVERS, Nurseries, Sawbridgeworth, Herts.

IMPORTANT TO POTATO GROWERS.

HAY, SANGSTER, AND CO., are now ready to send out their celebrated Stock of SEED POTATOES from prepared cuttings, now completely free from disease, of the following sorts, viz.:—

Early Ebrington Kidneys,	per bushel 12*s.*	Early American, per bushel,	8*s.*
		York Regents „	6*s.*
Early Oxford „	10*s.*	Scotch Cups „	6*s.*

Package and delivery in London, 9*d.* per bushel, and 2*s.* per sack.
Newington Butts, London.

EARLY SEED POTATOES.

JACKSON'S IMPROVED EARLY ASH-LEAF, 9*s.* per bushel. The celebrated Short-top Ashleaf, 7*s.* 6*d.*; British Queens, 7*s.* 6*d.*; the earliest round variety known, free to London; no charge for sacks.—JOSEPH WILSON, Seedsman, Ipswich; Agent for Wild's celebrated Cucumber, the Ipswich Standard, and beautiful semi-double Primulas. In sealed packets free by post, 2*s.* 6*d.*, in stamps, or order.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s.* per bushel.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

THE FLUKE POTATO.—A new second-early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s.*, bags included.
To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

CATALOGUE.

MESSRS. LANE AND SON, Great Berkhampstead, Herts, beg to inform their patrons that the under-mentioned descriptive Catalogues may now be had. General and Supplementary Rose Catalogues for two Postage Stamps.
Tree, Shrub, and Fruit Catalogues, for two ditto.
Azalea indica, Camellias, Hollyhocks, &c., &c., for one ditto.
Fruit trees established in pots are well set with bloom buds, many of them having had a good crop this season.

GEORGE JACKMAN begs to announce that he has just published a new and complete CATALOGUE of his Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.
Woking Nursery, 1½ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—November 25.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.
P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.
WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

TRANSON FORTEAU, NURSERYMAN, Orleans, France, begs to invite attention to the following list of FRUIT PLANTS for GRAFTING:—

APPLE, a year seedling, 1 to 2 feet	...	per 1000	8*s.*	6*d.*
PEAR „	...	„	10	0
QUINCE „ 1½ to 2 feet	...	„	21	0
PRUNUS MAHALEB, do., 2 to 3 feet	...	„	7	0
PRUNUS ST. JULIEN, do., 1½ to 2 feet		„	17	0

THOMAS ANSELL begs respectfully to inform the trade that he intends sending out his new and splendid DAHLIA, "Pilot," in roots; it is of a beautiful, bright intense, red colour; form exquisite, centre well up; fine cupped petals, and good habit. Ground roots may now be had, price 42*s.* each, and fine strong pot-roots at 21*s.* each.
N.B. No objection to take the amount in new Dahlias, new Geraniums, or any other description of stock of which T. A. may be in want.—Camden Nursery, Camden Town, Nov. 25.

CHRYSANTHEMUMS.

HUGH LOW AND CO., have to offer extra fine well-shaped blooming Chrysanthemums, both Pompone and large flowering, at 9*s.* per dozen. The plants are large, well-grown, and unusually well furnished with flower buds.
Clapton Nursery, London.

HOLLYHOCK SEED.

WILLIAM CHATER begs to offer packets of the above Seed, containing twenty sorts, selected from his best show varieties, at 5*s.*; 12 varieties, do., 2*s.* 6*d.*; and from good double border sorts, at 1*s.*—Also Pansy Seed, from the best flowers, 2*s.* 6*d.* per packet.—Strong Plants of the new Double Crimson Rocket, excellent bedding plants for spring flowering, 6*s.* per dozen, or 2*l.* per 100; Double French White, 4*s.* per doz., or 30*s.* per 100.—Saffron Walden, November 25.

DUTCH HYACINTHS, for Forcing, single and double, at 4*s.* per dozen. Also Narcissi, Crocuses, Tulips, Irises, Jonquils, Anemones, and Ranunculuses, priced Catalogues of which will be forwarded by post, from ARTHUR COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall.
Also Double Roman and Paper White Narcissus, the most beautiful and fragrant of all the Narcissi, 4*s.* per dozen.

ONE YEAR'S SEEDLING QUICK.

CHARLES SHARPE AND CO. have a large quantity of the above to offer, at 2*s.* per 1000.—A Trade Catalogue of NURSERY STOCK is now ready, and may be had on application.—Nursery and Seed Establishment, Sleaford.

THE PAMPAS GRASS, CYNERIUM ARGENTEUM.

LUCOMBE, PINCE, & CO. have a fine healthy stock of this highly ornamental plant, well established in pots, and fit to send out immediately.
Specimens of it are now and have long been flowering in their nursery, and it is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See woodcut and description of it in *Gardeners' Chronicle* of the 4th inst.
Sizes, prices, and all particulars may be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.

SPLENDID CONSERVATORY PLANT.

FUCHSIA DOMINIANA.—A beautiful example of this truly gorgeous plant was exhibited at 21, Regent Street, on the 7th inst., and without any exaggeration it may be said to have been the admiration of every one. There is now no doubt that it is one of the finest autumn and winter flowering conservatory plants we have. The merit of raising this beautiful plant is due to Mr. Dominy, the Foreman of the Plant Department at the Exeter Nursery; it consequently bears his name as a memento of his zeal and ability in the performance of his duties. It is a seedling between Serratifolia multiflora and spectabilis, having the fine free growth of the former and the splendid flowers of the latter.

A few extra strong specimen plants, 2 to 3 feet	...	21*s.*	0*d.*
Fine large plants	...	10	6
Small Plants	...	7	6

Exeter and Chelsea Nurseries, Nov. 25.
N.B. The specimen exhibited on Tuesday can be seen at Chelsea

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for GERANIUMS (show and fancy), FRENCH GERANIUMS, FUCHSIAS, VERBENAS, FAIRY ROSES, CHRYSANTHEMUMS, HELIOTROPES, CINERARIAS, CALCEOLARIAS, PRIMULAS, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

For further particulars, see Advertisement in last week's *Chronicle*. Catalogues forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, PROPRIETOR.

THE BEST CUCUMBER AND PRIMULA SINENSIS in the Kingdom, and BEAUTIFUL SEMI-DOUBLE PRIMULAS in five colours, pronounced by Beaton, Neville, Ayres, the Floricultural publications, and the Metropolitan Judges to be the best ever seen. IPSWICH STANDARD CUCUMBER, the only one ever known to embrace all the properties of "Wild's Standard." Mr. Glenny describes it as magnificent. Seeds warranted saved only from perfect Specimens, in sealed packets, free by post on receipt of 2*s.* 6*d.* in Stamps or Post Office Orders addressed to THOMAS WILD, Ipswich. A handsome Plant (3 ft. by 2½) of MEDINILLA EXIMEA, 8-size pot to dispose of. True ASH-LEAF KIDNEY and other POTATOES for Seed at reasonable prices. Seedsmen supplied with plain and printed paper bags in every size and quality.—A first-rate Gardener, with a 12 years' unexceptionable character, is disengaged.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to recommend to the attention of Gentlemen and others engaged in Planting, the following plants from his general Stock, they are in fine healthy condition. The American Plants annually exhibited at the Royal Botanic Gardens, Regent's Park, are supplied from this establishment.

RHODODENDRONS.—The following is a selection of the most admired scarlet, rose, and high-coloured varieties in cultivation: are perfectly hardy, and bloom for the most part during the month of June.

Blandyanum, fine rosy crimson	5*s.* to 7*s.* 6*d.* each.
Lady Eleanor Cathcart, vermilion rose and dark crimson spots	21*s.* 0*d.* „
Lady Wenlock, bright crimson	21*s.* 0*d.* „
Atrosanguineum, dark scarlet...	10*s.* 6*d.* „
Alaric, dark purplish crimson	7*s.* 6*d.* „
Omer Pasha, dark crimson, new	10*s.* 6*d.* „
Juba, crimson, intensely marked	10*s.* 6*d.* „
Lefevreanum, crimson, tinged with purple	10*s.* 6*d.* „
Attila, dark crimson	7*s.* 6*d.* „
The Grand Arab, fine glowing crimson	7*s.* 6*d.* „
Brayanum, crimson	10*s.* 6*d.* „
Nobleanum bicolor, crimson, white eye	7*s.* 6*d.* „
Vandyke, light crimson...	10*s.* 6*d.* „
Blatteum, dark purplish red	7*s.* 6*d.* „
Rubens, light rose	10*s.* 6*d.* „
The Duke of Norfolk, clear rose, fine	10*s.* 6*d.* „
Celebrandum, dark crimson purple	10*s.* 6*d.* „
Rembrandt, fine crimson	10*s.* 6*d.* „
Congestum roseum, fine rose, well marked	21*s.* 0*d.* „
Roseum novum, clear rose	10*s.* 6*d.* „
Leopardi, rosy purple, and very much marked ...	5*s.* 0*d.* „
Floribundum coccineum, fine	10*s.* 6*d.* „
Erectum, good crimson	7*s.* 6*d.* „
Towardianum, large rose, fine...	10*s.* 6*d.* „

For planting extensively, no kinds of Rhododendrons are better calculated for a display than the varieties of the noble Catawbiense; they are all perfectly hardy, producing fine trusses of blooms of various hues—scarlet, rose, purple, white, and spotted white. The list below contains the leading kinds:—

Catawbiense, good bushy plants, 50*s.* to 63*s.* per 100.
„ larger, 1½ to 2 feet, 12*s.* to 18*s.* per doz.
„ seedlings, fine bushy plants, 12*s.*, 18*s.* to 24*s.* per doz.

Catawbiense bicolor	Gloriosum
„ splendens	Sherwoodianum
Album elegans	Bouquet de Flore
„ grandiflorum	Melanthauma
Cæleste	Pictum
Cyaneum	Roseum elegans
Candidum	Victoria
Delicatissimum	Maculatum nigrum
Egregium	„ purpureum
Everestianum	Macranthum
Finibriatum	Nivaticum
Mirandum	Perspicuum
Lindsayanum	

Good strong well established bushy plants, 30*s.* to 42*s.* per doz. Larger plants can be supplied at a corresponding advance of price.

STANDARD RHODODENDRONS.—Of these, without doubt, we possess the largest stock of really good kinds. Nothing can be more imposing when in b'oom than a handsome standard. We have them 3 feet to 5 feet stems, and handsome symmetrical heads. The price of such would range from 42*s.* to 105*s.* each.

Rhododendron ponticum, good plants, 10*s.* 6*d.* per 100; larger, 1 to 1½ to 2 feet, 12*s.* 6*d.*, 15*s.* to 25*s.* per 100. This is especially worthy the attention of planters; it will thrive in any soil, and in the most severe weather; is never injured by hares or rabbits. Unquestionably it is by far the best shrub for under cover.

KALMIA LATIFOLIA, good bushy plants, 60*s.* per 100; larger, 12*s.*, 18*s.* to 24*s.* per dozen.

HARDY HEATHS, in 20 fine, named, varieties, many of them well suited to form edgings for larger clumps, 35*s.* to 42*s.* per 100.

HARDY AZALEAS.—A good assortment, if left to our selection, suitable for extensive planting, 1 to 1½ and 2 feet, 3*l.* 3*s.* per 100. The very best selected Ghent and other varieties, 18*s.* to 30*s.* per dozen. These produce flowers of all colours—scarlet, rich orange yellow, rose, and white.

STANDARD ROSES, of the most approved Perpetual and Bourbon varieties, 3 to 4½ feet stems, 18*s.* per dozen.

PINUS Douglasi, handsome seedling plants, 3 to 4 and 6 feet.
„ insignis; we strongly recommend our stock of this justly admired Fir, all of which are from seed, 2 to 3, 4, & 5 ft.
„ cembra, 3 to 4 and 5 feet.—Pinus excelsa, 3 to 6 feet.
„ macrocarpa, 2 to 3 feet.
„ Lambertiana, very handsome, 3 to 4 feet.
Araucaria imbricata, splendid formed specimens, 2 to 4 feet.
Cedrus deodara, of all heights, from 1 to 8 feet. We have a large quantity about 4 to 6 feet.
„ Africana, 3 to 4 feet.
„ Lebanon, handsome grown specimens, 3 to 6 feet.
Cryptomeria japonica, 3 to 12 ft.—Libocedrus chiliensis, 2 to 3 ft.
Fitzroya Patagonica, 2 feet.
Cupressus Goveniana, 3 to 4 feet.
„ Lambertiana, 3 to 4 and 5 to 6 feet.
Irish Junipers, 4 to 5 feet.—Irish Yews, 4 to 8 feet.

The above-named Coniferous Plants have been frequently transplanted, are perfect specimens, and have never been grown in pots. Prices will be forwarded on application.

J. W. begs respectfully to solicit an inspection of his stock, from those who are engaged in planting. A Catalogue, containing full descriptions of his celebrated Collection of Rhododendrons, as exhibited by him at the Royal Botanic Gardens, Regent's Park, can be obtained by inclosing two Postage Stamps.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to announce that they are now sending out the following new Plants:

HELIOTROPIUM, BEAUTY OF THE BOUDOIR; the best for Garden and Pot Culture.

CHRYSANTHEMUM, ANNIE HENDERSON; the summer flowering variety; colour yellow, and form of Annie Salter; very dwarf.

GERANIUM, PRETTY POLLY; the loveliest hybrid bedding Geranium; colour, orange salmon.

ACHIMENES HENDERSONI; the newest and prettiest hybrid variety out.

FANCY GERANIUMS: CLOTH OF SILVER, EVENING STAR, and CRYSTAL BEAUTY; for form, colours, and general good qualities unequalled.

CINERARIAS. MRS. ROGERS, MRS. GERARD LEIGH, FASCINATION, and PRINCE OF PRUSSIA. (No further orders can be executed for Mrs. Rogers and Mrs. Gerard Leigh until next spring.)

See Autumn Catalogue for full descriptions, price, &c. &c.

The NEW RHODODENDRONS discovered on the Bhootan Alps, by THOMAS J. BOOTH, Esq., surpassing in magnificence of flower the Sikkim species. Full particulars of them will be seen on reference to their Spring Catalogue.

T. PERKINS, Atherstone, Warwickshire, begs to offer to the Trade, strong GRAPE VINES from single eyes, of the following kinds, at 12*s.* per dozen. Samples sent on receipt of 24 postage stamps.

Chassel's Musque	Pitmaston White Cluster
Black Hamburg	Dutch Sweet Water
Groves End Sweet Water	Black Frontignac
Grizzle Frontignac	White do.
White Muscat	Black Prince
Muscat of Alexandria	Black St. Peter

Post Office Orders payable at Atherstone.

Priced and Descriptive Lists are now ready of AURICULAS, ALPINES, POLYANTHUSES, DOUBLE PRIMROSES, CARNATIONS, PICOTEES, PINKS, PANSIES, &c. &c. &c., and may be had on application, inclosing a Postage Stamp.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
„ insignis, 2 to 7 feet
„ Menziesi, 3 to 7 feet
„ pinsapo, fine plants, 3 to 6 feet
„ Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
„ nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
„ Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
„ thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
„ chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
„ Irish, 4 to 10 feet
„ gold-striped, 1½ to 3 feet
„ do., tall standards, 4 to 7 ft.
„ Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
„ Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

LILIUM LANCIFOLIUM.

HENRY GROOM, Clapham Rise, near London, by appointment, FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that this is the best time to have Bulbs of the different varieties of this most BEAUTIFUL LILY. They are well adapted for the Flower Garden, American Borders, and Drives in Parks, being quite hardy. His Catalogue may be had on application.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER'S descriptive List of the above splendid flowers, containing hints on their culture, and observations on exhibiting, &c., is now ready, and may be had on application; by forwarding one postage stamp.—Saffron Walden Nursery, November 18.

HOLLYHOCK SEED, from selected flowers of all the best collections in England and Scotland, 2*s.* 6*d.* per packet.

SPOTTED MIMULUS, from finely shaped flowers of every variety of colour and spot, at 1*s.* 6*d.* per packet.

CHOICE CALCEOLARIA, from the most superb collection in England, 2*s.* 6*d.* per packet.

JNO. AND CHS. LEE, NURSERY and SEEDSMAN, Hammersmith.

NEW CRIMSON DAHLIA "INCOMPARABLE."

MR. E. ABLITT begs most respectfully to announce to the Dahlia Trade that he purposes disposing of the above named splendid Seedling Dahlia in ground roots. Colour rich ruby crimson, fine shape, with great depth of well arranged petals, and good centre; it has been shown at most of the exhibitions in the neighbourhood, and greatly admired. Mr. Glenny also speaks of it in very high terms as one of the best in the crimson class.

☞ See Glenny's Almanack for this year, and Lloyd's Weekly Newspaper for October 29th, initials E. A., and Nov. 11th.

Terms, Five Guineas each root.

Onehouse, Stowmarket, Suffolk.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Baghshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Their new descriptive Fruit Catalogues, Ornamental Trees and Shrubs, American Plants, choice Rhododendrons, Roses, &c., can be had on application.

Pine-apple Place, Edgeware Road, London.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4*s.* per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s.* per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s.* per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

GLENNY'S SUPERB BALSAM SEED, from flowers unequalled in size, colour, and doubleness; in sealed packets, with "the culture." Six classes 37 stamps; a mixed packet, 13 stamps. Full allowance to the Trade, if taken in quantity.—Address G. GLENNY, Dungannon House, Fulham.

THE FOREST, THE PARK, THE SHRUBBERY, AND THE GARDEN.—*Noblemen and Gentlemen requiring Trees, Shrubs, or Fruit Trees during the present Autumn should obtain* RENDLE'S *New Autumnal Descriptive Catalogue, which can be had on application from*

WILLIAM E. RENDLE & Co., Nurserymen and Forresters, Plymouth. Established 1786. New Seeds, growth of 1854. Arrangements are now being made at this establishment for a large supply of genuine and good Seeds for the coming season.

TO THE AGRICULTURISTS OF ENGLAND.

HARRADINE'S "NE PLUS ULTRA" WHEAT.—A single ear of this wonderful Wheat, which was purchased five years ago of a soldier on tramp, who brought it from some distant country, was sown in 1849; the produce of this was again sown in 1850, and also in 1851, when it yielded at the rate of 19 coombs, 1 bushel, and 1 peck per acre. This induced me to continue its cultivation. A sheaf and a quantity of corn will be shown on Messrs. Garratts' Stand in the Agricultural Department of the Crystal Palace, by which its quality and general character may be seen.

The following Gentlemen kindly lent me portions of their land last season, to test the producing quality of the Wheat, and up to this year not one kernel has been sold for seed. The quantity sown on all the varieties of soil has in no instance exceeded 4 pecks per acre. On land of Mr. Wasdale, in the parish of Woodhurst, this Wheat was sown after Tartarian Oats, Clover, Seeds, Peas, and Tares (some being sown in February, and equally productive). On land in the occupation of Mr. Gadsby, in the parish of Godmanchester, 1 acre, the yield of which has been 30 per cent. over his own Wheat, grown in the same field, and has been tested by several Agriculturists in the neighbourhood. On land in my own possession, in Needingworth and other places (both Fen and Highland), it has been sown after Wheat, Clover, Barley, Beans, Oats, and Fallow, and in every instance has been most productive.

I am prepared to part with a limited quantity, which can be had on application to me, at 25*s.* a bushel. All orders to be accompanied by a remittance.

JOHN THANG HARRADINE, Needingworth, St. Ives, Huntingdonshire.

GARDEN NETS, FISHING NETS, SHEEP NETS, AND RABBIT NETS (made by hand, as machine-made knots slip), supplied at very low terms. Samples sent free.

W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, Kingsland, near the Gate, London.

Six Tents to sell cheap.

LARGE SURPLUS STOCK
OF TREES SHRUBS, ETC.,
NOW ON SALE AT
MESSRS. WM. E. RENDLE AND CO'S NURSERY,
Plymouth.

THE PROPRIETORS, *having a large surplus Stock of the following, can offer them at greatly reduced prices; and all Orders above £10 will be delivered free of carriage to any Station on the* BROAD GAUGE RAILWAYS, *and to Cork, Dublin, and Liverpool by Steamers.*

400,000 Seedling Scotch Fir.
500,000 „ Larch Fir.
200,000 „ Pinus austriaca.
200,000 „ Turkish and English Oaks.
10,000 „ Cedrus Deodara, from 6 ins. to 3 ft. in height.
10,000 fine Laurels of various sizes.
20,000 all the best varieties of Strawberries.
10,000 of the best Rhubarb Roots in cultivation.

With a large and general Assortment of Nursery Stock, including Forest Trees, Shrubs, and Fruit Trees, such as is generally found in a large Provincial Nursery.

All who intend to plant, either in the Forest, the Shrubbery, or the Garden, during the present Autumn, should procure their NEW AUTUMN DESCRIPTIVE CATALOGUE, *which can be had in exchange for one penny stamp on application to*

WILLIAM E. RENDLE AND CO., NURSERYMEN and SEED MERCHANTS, Plymouth.—Established 1786.

NEW CLIMBING HYBRID PERPETUAL ROSE, THE "DUCHESS OF NORFOLK."—Colour, Vivid Crimson. To be sent out for the first time about the end of October.

WILLIAM WOOD AND SON beg to refer to their advertisement in the *Gardeners' Chronicle* of September 30, page 627. Standards, half-standards, or dwarfs will be supplied at 10*s.* 6*d.* each, with the usual allowance to the trade.

N.B. When six plants or more are ordered by the trade, a very considerable reduction will be made beyond the usual discount, particulars of which may be had on application.

A Drawing of the above may be had for 6 Postage Stamps.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

ROSES.

WILLIAM WOOD AND SON, having a large stock this season, beg to offer fine strong Plants of the following kinds of HYBRID PERPETUAL ROSES, budded on fine selected stocks, from 4 to 6 inches, well suited either for potting or for planting in masses in the Rose Garden.

AT 15*s.* PER DOZEN (when one dozen of a kind is ordered):—Auguste Mie, Baronne Hallez, Baronne Prevost, Charles Boissière, Duchess of Sutherland, Duplessis Mornay, Egérie, Géant des Batailles, Jaques Lafitte, La Reine, Le Lion des Combats, Louise Odier, Madame Trudeaux, Pius the Ninth, Reine des Fleurs, Robin Hood, &c. &c. &c. Pius the Ninth is particularly recommended as a pillar Rose of extraordinary growth, budded plants of this kind in the Woodlands Nursery having made shoots from 5 to 6 feet in length this season, and flowers until very late in the year.

AT 10*s.* PER DOZEN (Hybrid Perpetual Roses): — Augustine Mouchelet, Duc d'Aumâle, Lady Fordwich, Madame Laffay, Marquise Boccella, Marquis of Ailsa, Mrs. Elliot, Prudence Roeser, William Jesse, &c.

N.B. The Trade supplied on liberal terms. Catalogues may be had in exchange for two postage stamps.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

RHUBARB ROOTS for FORCING or PLANTING. —Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s.* per doz.; HOWARD'S PRINCE ALBERT, 12*s.* per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford, Nov. 25.

NEW GERANIUMS, ETC.

ISAAC DAVIS, Larkfield Nursery, Wavertree, near Liverpool, begs to offer the following, being the best and most distinct of last year. Regalia, 5*s.*; Virginia, 3*s.* 6*d.*; Lucy, 3*s.*; Pilot, 3*s.*; Ladybird, 3*s.*; Sanspareil, 3*s.* Very bushy strong healthy plants. The favour of early orders will oblige, as repotting will be required shortly. The usual discount to the Trade.

Also an unrivalled stock of the following RHODODENDRONS, an acre from 1 to 5 feet; Green Hollies, half an acre 1 to 5 feet; many thousands of all the other kinds of Evergreens. Pinuses, Fruit, and Ornamental Trees, Shrubs, Roses, &c.; and a good collection of Greenhouse Plants in flower. An inspection of the above will convince any person desirous of purchasing, that they cannot be surpassed in quality or cheapness. Trees are not cheap at any price unless well grown.

NEW FANCY GERANIUMS.

Enchantress and Compactum, 10*s.* 6*d.* each; Mary Jane, 7*s.* 6*d.* do. Formosissimum superbum, 7*s.* 6*d.*; Eclipse, 10*s.* 6*d.* in the spring.

The set for 2*l.* 2*s.*, with usual allowance to the trade.

JOHN HALLY, NURSERYMAN and FLORIST, Blackheath, begs to refer amateurs and the trade for a description of the above to his Advertisement in the *Gardeners' Chronicle* of November 11; and also to inform them that he will not be able to send out any more of the Eclipse before the spring (except those already ordered), but any one ordering a set may have an extra plant of either of the other kinds instead.

NURSERY AND SEED ESTABLISHMENT, SLEAFORD.

CHARLES SHARPE AND CO., beg to draw the attention of the Nobility, Gentry, and Clergy, to their superior collection of Potatoes. Having devoted much attention to the cultivation and proving of the many different varieties, they can with confidence recommend the following as decidedly the best in cultivation for early planting.

Per Bushel of 4 Stones.		Per Bushel of 4 Stones.	
Early Ashleaf Kidney ...	10*s.*	Early Round Frame ...	10*s.*
„ „ „ Jackson's	10*s.*	„ Hen Nest	12*s.*
„ Martin's Globe ...	10*s.*	„ Emperor	10*s.*
„ Parker's Seedling	12*s.*	„ Cockney	10*s.*
„ King's	10*s.*	„ Oxford	10*s.*
„ Foxe's Seedling ...	10*s.*		

The above prices include Hamper and Package, and Delivery at the Great Northern, Manchester and Sheffield, Midland, and Ambergate Railways.

SONERILA MARGARITACEA.—This lovely Plant was exhibited at the Horticultural Society Rooms, 21, Regent Street, on the 7th inst., and was the gem of the exhibition. (See report in *Gardeners' Chronicle*). It is perhaps the most chaste of all variegated plants, producing, with its dark glossy green leaves, dotted all over with silvery white spots, a profusion of beautiful crimson flowers, with yellow stamens. It is a dwarf compact plant, of particularly neat habit. It requires the temperature of a cool Stove or a warm Greenhouse.

MESSRS. VEITCH & SON are now prepared to supply plants of the above, and have no hesitation in saying that this is one of the most lovely and delightful little plants it has ever been their good fortune to introduce.

Plants at 21*s.* each, with one over on three to the Trade.
Nurseries, Exeter and Chelsea, Nov. 25, 1854.

N.B. The Plant exhibited on Tuesday is now at the Exotic Nursery, Chelsea, and can be seen by the public.

NOW READY.

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready, and should be ordered forthwith, by which a full supply of every kind of Vegetable Seed required during the whole year will be secured (including the best sorts yet introduced), and at a very small cost, viz.:—*

No. 1 Collection	£3 0 0	No. 3 Collection	£1 5 0
No. 2 do.	2 0 0	No. 4 do.	0 15 0

The quantities in each collection being apportioned to the size of the garden, INSTRUCTIONS ON CULTIVATION will be enclosed with Nos. 1, 2, and 3. To secure the best sorts, orders should be given immediately, addressed

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

HYACINTHS, TULIPS, ETC.

WILLIAM E. RENDLE AND Co., SEED MERCHANTS, Plymouth, *have still on hand a fine assortment of all the best Hyacinths, Tulips, Anemones, Ranunculus, Gladiolus, Sparaxis, Lilium, Crocus, Iris, Jonquille, Snowdrops, Amaryllis, and other kinds of Bulbous Roots.*

The present is an excellent time for planting them either in pots or in the ground; but the sooner the better. All orders will be properly attended to.

RENDLE'S *Catalogue of Bulbous Roots can be had in exchange for two penny stamps, on application to*

WILLIAM E. RENDLE, and Co., Seed Merchants, Plymouth.

STRONG GRAPE VINES FROM EYES IN POTS.

LUCOMBE, PINCE, AND CO. have this season a fine healthy stock of strong VINES of all the best varieties, raised from eyes which they can especially recommend, as the wood is well ripened and the roots very vigorous. They have a few extra-sized Plants in very large pots in a full bearing state.

They have also a quantity of fine healthy Peaches, Nectarines, and Figs, well established in pots in a bearing state. Prices and further particulars to be had on application.—Exeter Nursery, Exeter. Established in 1720.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 25, 1854.

WE lately observed in one of the daily papers a letter from a gentleman who took upon himself to inform the world what sort of climate is experienced in the CRIMEA in winter, he having, as he stated, gained ample experience upon the subject by a residence in the *North* of Russia. Such he declares is the severity of the winter that brandy freezes as hard as the bottle which contains it, the fingers come off with a man's glove, his feet with his boots, and a musket barrel can no more be grasped by the naked hand than a bar of red hot iron. Hence he urges the necessity of troops being wrapped in sheepskins or cased in leather; for nothing else will protect them from the cold. We cannot avoid suspecting that the writer of the letter in question has mistaken the White Sea for the Black Sea, and Archangel for Sebastopol.

A more trustworthy account of the South Crimea is to be found in the writings of PALLAS, the great Russian Botanist who lived at Akmetshet, or, as it is now called, Sympheropol. In one of his works this author says—

"The mildest and most fruitful region in all the Russian empire is that continuation of valleys arranged in a natural amphitheatre at the southern base of Taurida (the Crimea), along the coasts of the Black Sea. The climate is little different from that of Anatolia and Asia Minor; *winter is hardly felt*, the Primrose and the Crocus appear above the ground in the month of January, and the Oak retains its green foliage throughout the year. 'No part of Taurida, perhaps of the whole empire, affords the botanist a greater variety of plants, or the husbandman a richer harvest. The ever-verdant Laurel grows beside the Olive, the Pomegranate, the Fig, or the Date tree, which might have been brought to the country in ancient times by Greek colonists. The manniferous Ash, the Mastich, the Sumach, the Bladder-nut, the sage-leaved Cistus, the Emerus and the Arbute of Asia Minor flourish in the open-air. The Walnut and almost every kind of fruit tree thrives in the woods or rather the natural gardens in the valleys. The *Caper bush is scattered along the coast*, the wild Vine reaches to the tops of the highest trees, descends again to the ground, and forms, with the Viburnum, festoons and garlands. High hills, masses of rocks, streams and cataracts, verdant fields and woods, and the sea that bounds the horizon, render the landscape equal to any imagined or described by poets. The simple life of the good Tartars, their cottages cut in the solid rock and concealed by the thick foliage of surrounding gardens, the flute of the shepherd, his flocks scattered on solitary hills, remind the stranger of the golden age. The traveller leaves the people with regret, and envies the destiny of mortals ignorant of war, the frauds of trade, and luxury accompanied with all its vices."

Although there is a dash of fine writing in this statement, the facts included in it give the Botanist satisfactory proof that the winter of the South Crimea has little to be dreaded. Where the Olive and the Caper bush, the Mastich tree and the Fig tree find themselves at home, there can be no serious cold. The Caper bush more especially affords unmistakeable evidence of a climate where a hard winter is unknown; and we know from other authority than that of PALLAS that it is an extremely common plant; in fact, the Capers of the Crimea are a common article of sale in the southern provinces of Russia.

It is undoubtedly true that occasionally there are exceptional winters. PALLAS himself informs us that, in 1847, the frost was so intense during the most boisterous north winds, that not only the whole sea of Azof, together with the Bosphorus, but also great part of the bay of Kaffa, and several creeks of the Black Sea were covered with ice sufficiently strong to support the weight of persons crossing both on foot and horseback. But this seems to have occurred on the north-eastern coast; the southern shore from Balaklava to Alouptka is sheltered from these cold winds, and it is there that we presume the troops will winter, if they winter in the Crimea at all.

We think therefore that those who have friends at Sebastopol may be comforted. On the hills it is cold enough we dare say; but there is no danger of the hands coming off with the gloves, or the feet with the boots, or of the musket barrels of our gallant troops burning their fingers. They are more likely to suffer from rain than frost, and we trust they will be effectually protected against both.

THE fate of EUROPEAN VINEYARDS may be regarded as sealed, for the present. The ruin of the Grapes in Portugal, France, Italy, Germany, and the Balearic Islands, appears to be so extensive that the price of wine must rise considerably, unless its consumption should much diminish. And this becomes the more certain when it is remembered that Madeira is in the same predicament, and when we add, as we can upon good authority, that mildew has begun to show itself in Sicily, whither it seems to have travelled from the kingdom of Naples, where the Grapes are in the same state as in France. How far Spain is exempt we are as yet uninformed, but we know that mildew prevailed largely in Grenada last year, and we have reason to believe that the mischief has this year been much greater.

Under these circumstances it becomes a subject of great interest to ascertain whether any of our colonies are likely, either to fill the void thus created, by exporting wine, or to relieve the market by the production of wine for their own consumption, instead of obtaining it from Europe. About the Cape of Good Hope we know nothing; but the kindness of a correspondent furnishes us with some facts respecting Australia which are worth communicating.

The wines grown in N. S. Wales are gradually displacing the imported, particularly among families not resident in the towns. If their use be once adopted, the majority of persons discontinue the consumption of imported wines, especially the highly brandied sorts from the south of Europe; alleging that they find those of home growth more wholesome and exhilarating.

Australian soils prove to be well adapted for the Grape, the average produce of well managed vineyards being considerably above what it is represented to be in the corresponding European climates. Perhaps this may be partly attributable to a better system of culture, one founded upon observation and study of the physiology of the plant, instead of empirical treatment, as handed down from generation to generation. Occasionally, however, great losses are experienced. The vineyards near Sydney suffered an almost total loss of crop during *three* years out of the last *five*; twice from heavy storms of hail, and last year from a singularly late and severe spring frost. These two accidents rarely occur twice to the same vineyard within a few years. The spring frosts are confined to a very few situations, and the hail-storms, although of fearful severity, are fortunately, for the most part, of very limited extent. The only other cause of loss to any extent is when a period of rain happens towards the maturity of the crop.

The crop of dry wines in ordinary years may be estimated at from 600 to 1200 gallons to the acre according to the kind of Grape. Of one very productive sort, it has been known to reach 1800 gallons. From this estimate must be excepted the years of failure arising from hail, rain, and frosts. More loss has been sustained during the last five than during the preceding 15 years.

It is, therefore, evident that in the districts near Sydney, wine in abundance may be, and is, obtained. The only question is, as to its quality. Upon this point we have had the opportunity of forming an opinion from samples transmitted by Sir THOMAS MITCHELL, WM. MACARTHUR, Esq., of Camden, and other Australian gentlemen. To Mr. MACARTHUR

we are more especially indebted for a case of samples accompanied by the following memoranda:—

"Memoranda relative to Samples of Wine grown at Camden Park.

No. 1. From Verdeilho Grape (Madeira), March, 1848.
2. „ Aucarôt (Departement des Landes), March, 1848.
3. „ Riessling (Rheingau), March, 1849.
4. „ Scyras, or Red Hermitage, March, 1848.
5. „ Muscat, or Frontignan, No. 1, April, 1851.
6. „ „ „ No. 2, „ „
7. „ „ „ No. 3, „ „

"The first four are dry wines, three of them white and the Scyras red. Of the white, the Verdeilho is the most spirituous, and the Aucarôt the least so, the Riesling the best. All are of a description which by keeping improve for an indefinite number of years. Hitherto the limit to which they may be kept with improvement has not been reached. Wines which occasionally develope an acid flavour during their earlier years part with it gradually.

"The samples in question are produced upon a deep porous alluvial soil, in no places very rich in decayed vegetable matter or other elements of fertility, and occasionally very sandy; but everywhere of immense depth, and from this cause, its free texture, and perfect drainage, favourable to the constitution of the Vine. We have ascertained that it varies little for the first 25 feet, and to the depth of 50 feet still continues to offer conditions favourable for the roots of Vines. The growth of the plants is for the most part luxuriant and uniform, the soil being very rarely in need of moisture, and never too wet. Vine roots have been traced more than 20 feet deep, with the appearance of going much deeper. The stems of the older plants of the Verdeilho (not yet 20 years old), are many of them 7 to 8 inches in diameter.

"The three samples of Muscat are of wholly different character from the other four. They are the produce of three sorts of the Frontignan, the white, black, and red or grizzly, mixed indiscriminately together. They were made in the same year by similar process, but from three different descriptions of soil; and differing considerably from each other may be curious as illustrating how greatly the character of wine is dependent upon the soil in which it is grown. In the colony they are very highly esteemed, the demand for them being much greater than the supply.

"No. 1, considered the best, is from a finely grained reddish loam, a good Turnip soil in which both Camellias and Azaleas flourish, but resting upon a deep bed of ferruginous gravel, almost a bed of pure oxide of iron, well drained but liable to burn in very dry weather. Vines from 20 to 25 years old.

"No. 2, containing the greatest quantity of undecomposed sugar, is from a much stronger soil, fine Wheat land for the first 15 to 18 inches, but resting upon decomposing calcareous rock, and full of fragments of tufaceous limestone.

"No. 3 is from the alluvial soil first mentioned, and less rich in sugar and spirit than the other two. All those soils have been well trenched and mixed 3 feet deep. The produce of this description of wine may be given at 250 to 300 gallons to the acre, quantity being sacrificed to obtain the extreme density of the must requisite for this class of wine.

"None of these wines have been grown with any view but home consumption; the high price of labour precluding the hope of successfully competing with the Vine countries of Europe in the English market, even if no objection on the score of quality existed."

Having been kept for a sufficient time after their arrival, these wines have been tasted, and with the following result. The Sweet Muscat wines 5, 6, and 7, proved to belong to the same class as the best Constantia, and to be in no respect inferior to the finest samples of that variety. In fact it was difficult to distinguish them. No. 4, the Scyras, was a dry sound red wine, not unlike good but over-kept port wine which had partially lost its colour, and undoubtedly such as would prove agreeable as soon as the palate became accustomed to it. Its fault was its want of what is called *bouquet*. Nos. 1, 2, and 3 had evidently been fine generous wines, but they had not borne the voyage well. The Aucarôt was pale, cloudy, and vapid. The Verdeilho was bright and strong, but too acid, and wanted flavour. The Riessling had the same fault, but was quite as good as much of the German wine that goes into consumption.

This result is in accordance with our experience of other samples, and shows that if wines capable of entering into competition with those of Europe are not made in Australia, it is not because the country is unable to produce them but because the colonists do not possess the skill required in their preparation. Even as it is there can be no doubt that Australia may be independent of other countries for her supply of this necessary of life, and that she will become so as soon as the high price of European wines renders it desirable that she should be. She may even supply the Indian market, as we believe she does to a small extent, and thus take off the pressure upon that of Europe.

The manufacture of wine is a much more difficult branch of the pursuit than the culture of the plant. One may spend a life in mastering some of the phenomena which complicate the subject. Like the manufacture of tea, or of beer, or of tobacco, it demands a nicety of manipulation which can only be acquired by long experience. Before the Indian Tea plantations could be made to produce Tea of good quality it was necessary to obtain Chinese who had learned the art of preparing the leaves; and every day's experience tells us the difference in beers produced from ingredients identically the same. What the Australian settlers want is a supply of wine makers from the most celebrated vineyards in Europe; they have long had the finest varieties of the Vine; their vineyards are by this time old enough to produce an excellent article; and they possess all the skill which sound theory and good observation can give them. What they want is something beyond either theory or the observation to be acquired in a lifetime. They want that practical skill which is the result of the observation of ages, and which nothing but experience can supply. The most learned of our chemists can explain philosophically every phenomenon connected with fermentation and preservation, but we should be sorry to entrust them with making our wine. It is probable on the other hand that many a wine-maker in the first class vineyards knows nothing about the chemical theories of the matter, although the wine that comes from his hands is among the finest in the market. We would, therefore, suggest to our Australian friends the desirableness of availing themselves of the present state of paralysis by which European vineyards are now unhappily affected, and of obtaining from some of the most celebrated of them the assistance of those experienced men in whose hands the peculiar art of wine-making alone resides.

New Plants.

102. Diervilla Middendorfiana, *Carrière in Revue Horticole*, 1853, *p.* 306; 1854, *p.* 261, *t.* 14; *aliàs* Weigela Middendorfiana *of Gardens*.

We have this in our gardens under the name of "the yellow Weigela." It is understood to have been received from the Russians, but we do not find any exact locality given for it. It is a deciduous shrub with primrose-coloured flowers, about half as large as those of *Weigela rosea*, and therefore not very shewy. The plant is, however, we are told, perfectly hardy at Paris, where it is grown with success in a peat border facing the east, among "Americans." It was beginning to leaf towards the end of January last; in February the leaves were nearly full grown, when they were a little injured (*fatiguées*) by a frost of 19° Fahr.; but they soon recovered, and the flowers opened on the 2d of April.

103. Marsdenia lucida. *Edgeworth.*

I send a specimen of Marsdenia lucida, of Edgeworth, which is a robust climber from the Himalayas, and sufficiently hardy to stand our winters in Ireland, without protection. Planted against a wall facing the north it has stood during the last three years, and is now very luxuriant, but has not flowered yet out of doors. The Marsdenia lucida was discovered by Major Madden, at an elevation varying from 7000 to 8000 feet, I believe near Almorah, where it climbs to the tops of high trees, and flowers profusely. The seeds from which our plants were raised were sent by that gentleman to me about six years ago, and flowers have been produced for the first time this season. *D. Moore, Botanic Garden, Glasnevin.*

The plant mentioned in the foregoing memorandum, is a stout glabrous climber with oblong coriaceous acute slightly cordate leaves 6 inches long and 3 broad. The flowers are in axillary globular short-stalked heads, not unlike those of *M. macrophylla*. The corolla is dingy purple, like that of Periploca græca, hairy inside. The coronal leaflets are shorter than the anthers, at the back of each of which they form a blunt tooth. The style is long, rostrate and bifid. Its fine foliage will render this welcome, wherever the climate suits it.

VEGETABLE PATHOLOGY.—No. XLVII.

207. Weakness of constitution may be exhibited in various ways, and may either be peculiar to the variety of individual, or may be induced by the vicious action of external agents, the effect of which is not transitory but capable of transmission to future generations, exactly as a man's constitution may be impaired by violent fever, and the evil tendencies induced thereby descend to his posterity. The tendency though first induced by external agents becomes innate, and therefore may then be strictly called constitutional. For if our position be allowed, that no weakness of constitution existed at the first formation of a species, it is clear that some cause must have induced such weakness in the various derived forms, though possibly entirely unappreciable to humane powers of observation and that cause in the first instance external.

208. Sterility or unfruitfulness is one of those conditions which is most clearly constitutional, though it may arise from various causes;—from over-luxuriance, which induces the formation of rampant shoots, instead of flowering branchlets; from malformation of the stamens or pistil; from multiplication of petals, which appropriates the nutritive matter which ought to have caused the development of the ovules, or finally from natural weakness, inducing a general unhealthy state of the tissues, which renders them unequal to such an effort as the production of fertile seed. Almost all these cases admit of remedy more or less complete, except where the cells themselves are diseased as regards structure or chemical condition; mere weakness may be cured by generous diet, and as regards other conditions, each has its peculiar remedy.

209. Chlorosis, again, is evidently in many cases constitutional, though it may sometimes be induced directly by external causes, provided at least all cases of chlorosis are to be considered of the same nature. Partial chlorosis or variegation is not dependent, as far as we know, on any external conditions, for a single twig only of a healthy plant may exhibit it; but if grafts or buds are taken from this shoot, all the descendants will partake of the same affection, which will sometimes be communnicated to the stock. Total chlorosis often exists in seedlings where there is no reason to suspect any external evil agency, but in such cases life is seldom sustained beyond a few days.

210. Preternatural developments of particular parts again depend, in the first instance, on internal causes over which we have no control. These are sometimes capable of propagation by seed if due pains be taken to keep the produce pure; but, in some instances, they are extremely evanescent, and can only be maintained within some very limited district. The variety of Cabbage known under the name of Brussels Sprouts cannot be kept up by propagation from English seed; but not only is this a well-known fact, but there are only a few districts abroad where the seed can be produced in a state of purity. I was surprised to hear, for instance, at Lille some years ago that it was impossible to grow seed there which would with certainty produce this particular variety, though differing but little in external circumstances from the districts where the seed is always produced true to its parent stock. It appears, however, upon the authority of Van Mons, that, while the seed remains true at Brussels and Louvaine, at Malines, which is equidistant from Brussels, it never comes true; and this not because of any difference of soil, for at Brussels it succeeds equally in sandy soil, mixed with black moist loam, and in white clay.

211. It should seem further, as Dr. Lindley observes in his "Theory of Horticulture," p. 316, "as if many of our most esteemed garden plants were the result of debility; and that the succulence, the sweetness, or the excessive size, which render them so well suited for food, were only marks of unhealthiness." It is well known that far truer seed can be raised from many plants when transplanted than when suffered to seed on the ground. Lettuces, for instance, if allowed to grow without transplantation in the spot where a plant has stood for seed are seldom good for anything, and in one or two generations their produce will be worthless. The best growers of Turnip seed always grow it from transplanted roots. When it is remembered that this process takes place at a great expense over perhaps as much as a hundred acres, we may be quite sure that the intelligent nurserymen about London would save themselves this heavy outlay if it did not answer the end proposed. Now the only effect of transplanting at the season immediately preceding the formation of a flower stalk would seem to be that of checking the luxuriance of the individual operated on; or, upon the above assumption, of increasing the debility of constitution.

212. On the same principle it is that good varieties of many of our most beautiful Floral ornaments can be obtained only from that seed which, as regards outward appearance, is the least promising. Plump seed, for instance, from a semi-double Dahlia will prove worthless, while from a flower on the same stem, which has scarcely had strength in consequence of the multiplication of its petals, to produce a small dwarf seed, presenting little hope of vegetation, some new and valuable variety may be raised. Instances might easily be multiplied, but these are quite sufficient for illustration. *M. J. B.*

ORIGIN OF THE PEAR TREE, ITS PROGRESS, AND SUCCESS.

In a previous communication I promised to submit to your readers a list of the most hardy and vigorous varieties of Pear trees, raised from seed in Belgium, and which are probably, even now, but little known to the generality of English amateurs. This promise I am now about to fulfil. But before giving this list, I think it will be well to enter into some preliminary considerations.

Whence came the species of Pears at present cultivated in the north of Europe? How have we succeeded in acclimatising this valuable fruit-tree?

The solution of these questions is necessary, in order that we may know the progress made, especially in our own times, and the improvements which may be effected in certain kinds.

No historical document contains any information as to the native place of the primitive type of the Pear-tree. It is presumed to have come from the same countries as the Vine, Cherry, Peach, and Apricot; and

most probably it grew originally on low hills and slopes. Indeed, at the present day, notwithstanding the numerous transformations by seed, it thrives best in such situations after it has arrived at a certain age.

The Pear tree was cultivated more than 2000 years ago by the Greeks and Romans, in whose writings are preserved the names of several varieties raised from seed. It must have been introduced into our countries by the Romans, after the conquest of Gaul and England. It is known that the productions of Italy cannot be preserved in our variable, foggy, and severe climate, unless sheltered by walls with a good aspect. In sowing the seeds of fruits ripened in our country, with the view of raising stocks for the propagation of introduced varieties, some trees more vigorous may have been obtained. Among these trees, some might be observed to produce fruit as standards in the open ground, in good seasons; and the seeds of these would produce hardier trees, better adapted to the climate than those originally introduced.

In Belgium, where the soil is generally deep, and rich in humus, the Pear tree, on its own stock, has been cultivated from time immemorial as a standard in the open ground. One of our ancient authors, Dodonæus, of Mechlin, in speaking of the Pear tree, in his herbal, towards the middle of the 16th century, said that the names of orchard varieties change from one village to the other, and he therefore considered it useless to cite their names. This allegation proves to a certain extent that, even at this period, a great number of varieties existed in the country, doubtless of tolerably good quality for kitchen use. This mode of sowing seeds of Pears, in order to obtain vigorous trees, is continued in Belgium, especially in the gardens of convents, and in those of the nobility and rich citizens, of whom several esteemed varieties bore the names. These varieties are, however, nearly all lost, owing to their not having been propagated in due time.

It is known that a seedling Pear tree passes, if we may use the simile, through the periods of infancy, adolescence, virility, to those of old age and decrepitude. The age which a seedling Pear tree may attain depends on its individual constitution, the soil in which it is planted, and the pruning, trimming, and cleaning from insects which it may undergo during the whole period of its existence. This varies from 100 to 200 years or more. It is during the age of virility, when the tree is in a fruitful condition, and most flourishing state of vegetation, that grafts should be taken for propagation. By so doing, all the inherent qualities of the individual will be transmitted. This observation of general application to all fruit trees is more especially so with regard to Pear trees for the open ground.

Owing to the negligence in propagating, and more especially at the proper time as regards the vigour of the tree, many hardy and good varieties of Pears, known to our ancestors, are now lost. This circumstance has induced some pomologists to believe that a variety of Pear has only a limited term of existence, at the expiry of which it must necessarily become extinct. This opinion appears to be contrary to every principle, and to facts. We see a vast number of kinds of plants perpetuated by artificial propagation, and why should it not be the same with varieties of fruit trees? We believe that varieties of these could be infinitely propagated by scions taken from trees of proper age, and with due care, for ages to come. There are doubtless causes of weakness, but this is not the place for treating that question in detail. These causes could not have existed in Belgium, where we cultivate but few on the Quince, the preference being given to vigorous wild Pear plants raised from seeds of orchard Pears, for stocks whereon to work, standard high, the sorts intended for orchards, and also for dwarfs and pyramids destined for garden culture. It is thus that the Pear tree is preserved in all its vigour, and has been able to produce a more robust progeny. In other localities, the artificial culture on the Quince stock must have accelerated the weakening of the trees, and the degeneration of existing varieties; and it is with justice, we think, that some modern pomologists and men of experience attribute the degeneracy chiefly to the above circumstance.

In directing our attention to more southern countries, we may observe that some good varieties have been obtained in Italy, Spain, and France. But these varieties, such as the Chaumontel, Beurré Gris, and the Virgouleuse, do not succeed in our climate except against a wall furnished with a coping, the soil being previously prepared; or otherwise in gardens in peculiarly well sheltered situations. Everywhere else, formerly, as at the present day, in Belgium as in England, these good varieties have, in ordinary seasons, only produced gritty or unsound fruit, whilst the trees attacked by various diseases have died off.

At Mons, the chief town of the province of Hainault, Belgium, certain varieties of Pears, of great merit as regards delicacy of flavour, were obtained in the latter part of the last century. Of seedlings raised by the Abbé d'Hardenpont, the Passe Colmar, dates from 1756; the Beurré d'Hardenpont from 1759. This variety is known in England under the name of Glou-Morceau (Glou, in Walloon language signifies *Delicious*, or *Dainty;* Morceau, French, *Morsel or Bit;* the name may therefore be translated *Delicious Morsel*, or *Dainty Bit*. Glou Morceau is its common name, but the true name is Beurré d'Hardenpont. In France it is known by the name of Beurré d'Aremberg, an error which originated with the late M. Noisette of Paris). These varieties, and also the Délices d'Hardenpont and Fondante Paniselle, do not possess sufficient vigour and hardiness to succeed generally, unless against a wall. The variety called Beurré de Rance, found by the same Abbé d'Hardenpont, at the village of Rance, in Hainault, is one of the most vigorous of the varieties of keeping table Pears which were raised in the end of the last century.

The varieties Beurré Capiaumont, Bon Chrétien, Napoléon, and Marie Louise were raised from seeds at Mons, by the late M. M. Liard, Capiaumont, and Delcourt; they are of more recent date, and are more vigorous than any of the others obtained in that town from seed. We shall only mention those which are generally known. Neither La Fortunée of Reumes (not Parmentier; the former was the sower, the latter the propagator); nor the Colmar Nelis, or Nelis d'Hiver de Malines, raised in the garden of the Councillor Nelis; nor the Urbaniste, found by the Comte Coloma in the garden of a religious establishment at Mechlin; nor the Beurré d'Aremberg, or Orpheline d'Enghien; not one of all these have, or ever could have had the hardiness or vigour requisite to succeed well anywhere, except in a situation sheltered from the east and north-east winds.

J. de Jonghe.

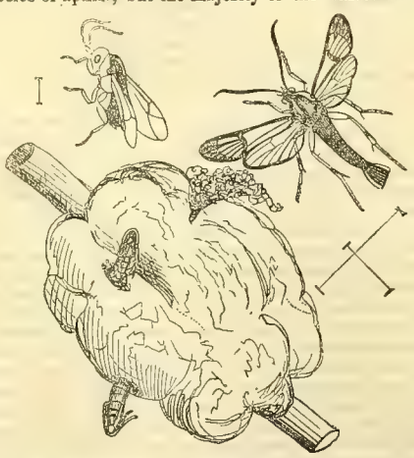
(*To be continued.*)

ENTOMOLOGY.

The American Oak-gall Clear-winged Sphinx.

The formation of galls upon the stems, twigs, or leaves of trees, and other vegetables, is one of the curious questions in botanical physiology which has not, we believe, been hitherto satisfactorily explained. That the puncture of an insect is capable of causing much irritation and swelling is well known to every one who has unfortunately happened to be stung or bit by bee, gnat, or other still more obnoxious species; and when we bear in mind that the smallest point of a thorn broken off and left in the finger will rankle and cause a sore if not extracted, and that the puncture of the insect which produces the gall is accompanied by the deposition of one or more eggs in the wound, which remain therein, we may easily account for the continued action and irritation producing effects which, in some cases at least, seem far beyond the apparent cause, resulting in the development of large masses of hard woody matter giving support to the young animals hatched from the eggs deposited in the wound.

Various kinds of galls, indeed, are the result of the simply puncturing of the plant by insects for their own nourishment, of which a very remarkable instance was given in this paper (1849, p. 755), where large woody galls were produced on the stem of a Pear tree by the attacks of a species of aphis; but the majority of the various kinds



of galls are produced by punctures made by the females of the species of the Hymenopterous family Cynipidæ for the deposition of their eggs. But even in such cases it is not only the young of the cynips which is often found inhabiting the interior of the gall. The larvæ of the cynips have their insect enemies, and the same gall will sometimes produce not only the cynips but two or three different kinds of parasites, which have fed upon and destroyed some of the larvæ of the cynips. Lodged in the depths of its woody gall one would imagine it safe from the attacks of its enemies, but an all-wise Creator has endowed all His creatures with instincts fit for the performance of their respective duties; and not only is the female parasitic Callimome enabled by its instinct to discover in what part of the gall the larva destined for the food of its young is lodged, but, being furnished with an ovipositor several times longer than its whole body, it is enabled to thrust it into the gall to the requisite depth till it reaches the cynips larva, where it is deposited and quickly hatched. With the exception of these parasites we believe no other instance is recorded of any other insect inhabiting or feeding upon the galls than the legitimate inhabitant thereof.

We are indebted to Professor Henslow for calling our attention to an instance in which an American species of Oak gall has given support not only to its own peculiar species of cynips, but also to another insect belonging to an order and genus which would scarcely have been supposed likely to have been found in such a situation. On looking at some galls on the American Quercus palustris, then recently received from North America, at the Economic Museum of Botany, in Kew Gardens, Professor Henslow, in company with Mr. H. Smith, the intelligent Curator of the Museum, observed at the bottom of the glass case containing the specimens several of the cynips in the winged state, which had made their escape from the galls, and amongst them were also observed four specimens of a Trochilium, closely resembling our currant clear-winged sphinx (the history and figure of which is given in the *Gardeners' Chronicle* for 1841, p. 780). Professor Henslow further ascertained that they had been feeding, in the larva state, on the galls themselves, as he found the pupa cases still sticking out of them. On examining the galls we had further evidence that the Trochilium larvæ had been feeding on them, as we observed masses of their excrement sticking on the outside, where the larvæ had found or made an aperture, as represented on the upper-side of the gall in the accompanying figure, in which two of the pupa cases are seen still sticking out of the gall. Professor Henslow adds that the Trochilium is a cunning fellow to prefer the softer substance of the gall to the hard wood of the Oak. The mode in which the chrysalids of the Trochilium make their way half out of the gall, where they remain fixed, and assume the winged state, is similar to that which is pursued by the goat moth (*Gardeners' Chronicle*, 1847, p. 303) and wood leopard (*Gardeners' Chronicle*, 1846, p. 236), under similar circumstances. We presume it is whilst the gall is young and soft that the Trochilium introduces her eggs into some crevice in the soft surface, as she is not provided with any apparatus capable of boring like the Cynips or Callimome.

The Trochilium* appears to be a new species, nothing like it being described in Dr. T. W. Harris's Monograph on the American Sphingidæ. We may, therefore, describe it under the name of Trochilium gallivorum.

It measures 8 lines in the expanse of the fore wings, and 5 lines in the length of the body. It is of a blue black colour, with two slender pale yellow diverging lines on the sides of the thorax above, and with the edges of the tail also pale yellow; the wings are transparent except the dark fore margin, a curved bar across the middle, and a pale brown apical border. The legs are yellow, with a dark ring round the tibiæ near the tips.

The Cynips likewise appears to be a new species, and may be named C. palliceps; it is of a black colour, with the head and front and under parts of the thorax pale yellow. The males are distinguished by the large size of their heads. It is represented magnified on the left-hand side of the upper part of the accompanying woodcut, its natural length being rather less than 2 lines. *W.*

Home Correspondence.

Planting Vines in Brick Boxes.—At p. 725 your correspondent "Anxious" has favoured us with his method of making a Vine border, and has certainly taken much trouble to explain the kind of materials employed and their cost; but he has forgotten to mention their carriage, labour, brickwork, &c., which surely, being a practical man, he does not do himself; he further states that he does not know whether his plan is old or new; but at the same time he does not see, he says, why it should not be universally adopted. It is surely, however, to say the least of it, premature to advise people to follow his example before he knows whether he is right or wrong. He ought to have known, however, that the plan of planting Vines in brick channels, or, as he terms it boxes, has been tried years ago. We all approve of a concreted bottom where the subsoil is cold and wet, and also of shutters to screen Vines from bad weather; but planting permanently in a box 8 feet long by about 3½ feet wide is contrary to all experience, for we know that Vine roots in a healthy state run a great distance; and that if there should be any good soil near them they will be sure to find it. Why therefore should we cramp the roots upon all sides? Surely we do not want to plant Vines every six or seven years, which by the plan "Anxious" recommends we should be compelled to do, as they would be entirely exhausted by the time we should expect them to get well established and in good bearing condition. Something will be found to go wrong; the roots, of course, will be examined, when they will be found twisted together like a door-mat; and then down come the channels, and the roots are allowed to ramble. But why does "Anxious" recommend planting in channels? Is it because he wishes to fill up his 25 feet border with several courses of bricks, or has he been a successful grower of Vines in pots, that he admires boxing up their roots? No; it is simply, in the first place, because "if a Vine should be planted wrong to name, he can remove it without injuring the roots of its neighbour; and, again, because if one Vine is a stronger grower than another, its roots may not encroach on the weaker kind." These seem to be the principal reasons why he prefers planting in boxes. Now, if these are the only advantages to be derived from the system, why not plant the strong-growing varieties at each end of the house? and should one by chance be wrongly trained, would it not be better to inarch the right sort on it? This, I think, would be better than boxing up the roots in the manner described. As "Anxious" appears to be a stranger to the method he has adopted, perhaps the following remarks on planting Vines in channels may be useful to him. A short time ago I was at a large establishment where the Vines

* We must refer to our work on "British Moths and their Transformations," for the reasons which induced us to adopt this older generic name in lieu of Ægeria. Mr. Stephens has subsequently adopted our views in the recently published British Museum Catalogue of British Lepidoptera; the Trochilium of his former works is the genus Sphecia of Hübner.

had been planted like those recommended by "Anxious," but they were allowed more than double the room he mentions to extend their roots in. For a few years after planting they did well, and bore excellent crops; but they have now entirely exhausted every bit of the soil they are growing in, and the consequence is the Vines are fairly going back. The channels have been opened, and the roots were found matted to such a degree that the front wall has been removed to allow them to extend themselves. "Anxious" cannot therefore expect to succeed in an 8-foot channel when Vines fail whose roots have double the room allowed them to roam in; and if he wishes his plan to be universally adopted, he must hold out greater temptations before he will be able to get many to follow it. *Doubtful.*

Forming an Orchard on thin Soil on Gravel.—In reply to "Beta," permit me to state that much labour would be saved by simply removing the 5 inches of good soil, and on the top of the gravelly subsoil putting 1 foot of clay. Mix the surface soil with good loam and lay it on the clay to the depth of 2 feet. I would not advise the admixture of leaf-mould with dung, as it would tend to induce over luxuriant growth. The clay when buried 2 feet beneath the surface would still retain its capacity for water, but from the gravel beneath, and the action of worms, it would not retain moisture in excess; it would, however, hold sufficient for the growth of the trees, but it will not ultimately prevent their roots from penetrating the gravel. If the climate and exposure are suitable, there is every reason to expect abundant crops from Pear and Apple trees planted in such a soil; but for Cherries, Plums, &c., I would not advise the use of clay. Let the top soil be mixed with the good loam and laid on to the required depth. The finest Mayduke Cherries I have ever seen were grown on a light soil about 15 inches deep on a gravelly subsoil. It may be taken as a general rule that trees bearing stone fruit will do best on a gravelly subsoil, such as Cherries, Plums, &c., and that Apples, Pears, &c., will succeed on well-drained clayey subsoil. Much, however, depends on climate as well as on soil. *James Falconer.*——If "Beta" will follow his gardener's advice, I think he may succeed, provided the land does not lie too high, in which case the attempt to establish an orchard on such a soil would be useless. As it is, the greater the space broken up for the roots to run in the better, replacing the bad soil with a layer of strong loam or clay as proposed. Plant the trees in good loam, mixed with a little well-decayed manure, to encourage the growth of young roots, and I have no doubt that success will follow; though owing to the unfavourable character of the natural soil, the trees would not perhaps be so long-lived as in more suitable places; but to counterbalance that evil they would be more likely to escape the effects of late frosts, and their more certain enemy canker. They would, however, be apt to be infested with moss and lichens, but an occasional coat of lime-wash would be an effectual remedy for these. Of course as the soil is so porous there is no need of anything in the shape of drainage, but I would advise a layer of the largest stones to be placed on the surface, which would help to check rapid evaporation, and keep the roots comparatively cool and moist in hot dry weather. As regards kinds of fruits most likely to succeed, stone fruits, as Plums, Cherries, &c., seem to prefer a gravelly soil, consequently, they would be the most likely to flourish. Pears and Apples should have the advantage of the deepest soil and the lowest situation if the land is on a descent, and if artificial irrigation could be applied to the soil when necessary it would greatly add to the chances of ultimate success. And as the unsuitable kind of soil would most likely cause a weak and stunted growth in the trees, I would recommend the stronger growing kinds of Pears and Apples to be planted, such as Beurré Diel, Brown Beurré, Beurré Rance, Williams' Bon Chrétien, Chaumontel, Althorp Crassane, Glou Morceau, Jargonelle, Marie Louise, &c. Of Apples, I would take Alexander, Blenheim Pippin, Dumelow's Seedling, Gloria Mundi, King of the Pippins, Keswick Codlin, and Ribston Pippin, &c. *T. X., Salop.*——"Beta's" best plan will be to dig a hole for each tree separately 3 feet deep, 7 feet wide at the bottom and from 5 to 6 feet wide at the top; to form the hole concave, to line it well with loamy turf, surface downwards, to fill the hole with the composition mentioned, and to plant the trees above the surface and not in the hole. This is the most simple and practical system of proceeding under the circumstances mentioned. *The Manager for Messrs. Weeks & Co., King's Road, Chelsea.*

Heracleum giganteum, Foxglove, and Purple Goat's-beard.—In your volume for 1851, p. 710, there is a communication, with the signature "M. D.," offering, gratuitously, seed of Heracleum giganteum. I was one of those who applied for a packet of the seed; it was immediately sent to me, and was sown late in the autumn of the same year. The young plants appeared the following season, and in the summer of 1853 several of them blossomed; the remainder did not blossom till this summer, but they were more vigorous than those of the preceding year—the finest specimen being 10 feet high, with a stem 10½ inches round, and the tallest 11 feet high. I have saved the seed of the finest blossoms, which I shall be glad to distribute to any who may apply for it. I have also the seed of several fine varieties of the common Foxglove—white, white-spotted, and various shades of rose colour, from faint rosy to full purplish rose. In my garden, the plants this summer were from 6 to 7 feet high. Another plant, of which I have plenty of seed, is the purple Goat's-beard (Tragopogon porrifolius), the produce of seed from a locality in the north of Somersetshire. The plant is rarely found wild, and the seed I have found difficult to procure from the seed shops. A letter addressed to C. Halesleigh, Post-office, Bridgewater, and enclosing a postage stamp, will ensure a packet of either of these seeds, or two of them, or all three, as may be desired, if two stamps be enclosed. *T. C.*

Late Strawberries.—Having observed in one of your late Numbers a notice of a Strawberry gathered on the 31st of October, I am induced to communicate to you the fact of my having gathered a plate of Strawberries on the 2d, and another on the 4th inst., in sufficient quantity to be served with the dessert. They were from a bed of Cuthill's Black Prince, unprotected in any way, and even now several of the plants are still in blossom. The Strawberries were well coloured and of good flavour. *George Cottle, Tedsmore Hall, Shrewsbury, Nov.* 20.

New Pasture Grasses—(Glyceria renata, &c.)—Just before Mr. Webb's death in Paris, he sent to England some plants of a Grass, labelled "Glyceria renata, Bois Marécageaux à Meudon," with a recommendation that it should be tried as a pasture Grass. His sudden death prevented me from making any further enquiries. Can you tell me what is known of Glyceria renata, and whether it has been tried heretofore? It seems perfectly hardy, but rather wiry, and unpromising in appearance. May I also ask whether any trials have been made of a large hardy Grass, Ceratochloa unioloides? It seems very well adapted for poor soils especially. Having been long known, perhaps it has been tried, and failed. *W. W. S——r.* [Of the first we know nothing; of the second we have heard nothing.]

Brassavola cucullata.—Will any cultivator of Orchids kindly give me a hint for the cultivation of Brassavola cuspidata or cucullata. The first of the genus which was introduced, and which is figured, if I mistake not, in Sir Hans Sloane's Jamaica, and there represented as flowering profusely. I have cultivated it some 15 years or more, and it now and then produces one or two flowers which are more powerfully fragrant than any other Orchid I know. But why it flowers when it does happen to do so, or it does not flower more regularly or freely, I cannot discover. I have several plants, and have tried every variety of treatment, but the plant which does flower, and is now producing one solitary blossom, is a large mass suspended on a block close to the light in rather a high house, where it is exposed to much heat and light in summer, and rarely receives any water. It grows freely, but its flowering is most capricious. Would it be more likely to flower if grown on a block of pumice-stone? The Brassavolas are said to grow on stones; but in the work to which I refer, this is I think represented as growing on a tree. *J. R. S. O.*

Grafted Rhododendrons.—I have been somewhat surprised at "J. R.'s" remarks on this subject. He states that almost all the plants offered for sale by cultivators are grafted, and, consequently, for most purposes, useless. From what source he has arrived at such a conclusion I am at a loss to guess. I will admit that the Indian varieties, such as Arboreum, &c., have all a tendency to swell too large where they are united with the stock which prevents them from flourishing for any length of time; but still I have known grafted plants of even these to flourish and flower beautifully for many years. As regards hybrids of the more hardy kinds, I can positively refute all "J. R.'s" statements, as I have for many years pursued with the greatest success the system which he has so unceremoniously attacked. I can assure him that grafted plants are in most cases to be preferred to any others. In my nursery may now be seen thousands of all sizes; standards and others, some of which measure from 8 to 10 feet through their heads; these have been grafted upwards of 25 years, and they are as handsome as can be desired. In many cases it is almost impossible to discern where they have been worked. Surely this is a proof that grafted plants are not useless and short-lived. Should "J. R." be pleased to favour me with a visit he will then see that I have not said too much respecting my grafted specimens, and I think he would leave with a different impression from that which he entertains respecting the value of worked plants. *John Waterer, of the American Nursery, Bagshot, Surrey.*——"J. R." asserts "that the Indian Hybrid Rhododendrons are of large and luxuriant growth, in fact, tree-like shrubs, but when grafted on any of the shrubby kinds they are necessarily stinted, and cannot fail to be short-lived." Would your correspondent be so good as name what particular hardy sorts with such habits he alludes to when speaking of Indian hybrids? As far as I am aware, the Indian varieties are mostly crossed with such bushy sorts as Catawbiense, Maximum or Ponticum, by which they lose, to a great extent, their large tree-like habit, and most of such hybrids, when grafted on Maximum or Ponticum are not more luxuriant than their stocks, and are as well calculated to form elegant specimens, and to develop their natural habit as those raised from layers or seed, and at the same time they live as long; layering is at once a tardy and expensive process, and if we depended upon it alone, it would be impossible, during the lifetime of the raiser of a new hybrid to procure more than a very limited number of plants; while a plant obtained from a layer will be an unsightly object long after a grafted plant has developed its beauties both as to habit and flowers. Would "J. R." explain what difference he imagines to exist between a grafted Rhododendron and a grafted Apple or Pear tree?—the latter seem to live long and form handsome trees, and a grafted Rhododendron appears to be as closely united to the stock as either of these fruits. I have, indeed, seen some of the finest hybrids which have yet been raised, and which were grafted 20 years ago, exhibiting at the present time all the appearance of perfect health, and in every way as handsome as those raised at the same period from seed. If "J. R." would closely examine the stock of some of those nurserymen who cultivate Rhododendrons largely for sale, he would find that provision is made for the wants of such as himself by the majority of the worked Rhododendrons being grafted not more than 2 inches from the root, so that when put out into the shrubbery they can be planted with safety with the grafted part below the surface; by doing this the scion will emit roots, and will in a short time be independent of the stock for sustenance, a fact to which every one who has had much experience in Rhododendron growing will bear evidence. "J. R." would doubtless confer a favour on Rhododendron growers if he would kindly furnish them with the names of the sorts in his collection which equal Arboreum in colour, and Catawbiense in size. *Hugh Fraser, Stanwell Nurseries, Edinburgh.*

The Sunflower.—In No. 37 of the current year, "B." recommends the cultivation of this plant, particularly on newly-cleared woodlands. Now, being about to cut 5 acres of coppice of 17 years' growth, I should like to try a cheap experiment as to the growth and profit, by planting a part or the whole with Sunflower seed. Will "B." therefore kindly tell me how to proceed, and inform me of any simple machine by which I can get the fibre from the stalk, or one to obtain oil from the seed, or how I can dispose of my crop when grown? *J. B. N., Liverpool.*

Foreign Correspondence.

Mr. M'Glashan's Apparatus.—*Paris, November* 22.—Sir,—Having had the honour of witnessing a trial exhibition of M'Glashan's Transplanting Apparatus, which took place yesterday afternoon, in the Bois de Boulogne, in presence of their majesties the Emperor and Empress, I take the liberty of communicating to you the entire success of the experiment. Their majesties expressed themselves highly pleased with the results obtained, and Mr. Stewart M'Glashan's, the inventor's, explanation of his machine; and the Emperor having bought the apparatus exhibited, requested Mr. M'Glashan's presence at St. Cloud on Thursday morning next, to repeat the experiment in the gardens of the palace. As I have obtained permission to witness this second trial also, I shall have much pleasure in forwarding to you a detailed account of the proceedings on that occasion, feeling persuaded the nature and importance of the subject will induce you to allow it place in the columns of your journal. *Yours most respectfully, Jules G. Brandt.*

Leaves from my Chinese Note Book: No. 7.—*Chinese Entomologists.*—During the hot season, when insects are numerous, I generally carry an insect net and box with me, in order to pick up any specimen of interest that may fall in my way. This proceeding seems to astonish the northern Chinese beyond measure, and from the mixture of awe and pity which I can see depicted in many of their countenances, they evidently think me a little cracked in the head. The more intelligent amongst them fancy I am collecting for medical purposes, and that all my specimens are destined to be chopped up in a mortar and made into pills, to be swallowed by the sick. They have not the slightest idea of the study of entomology, and only laugh at me when I attempt to convice them that insects are collected for such a purpose. The medicinal value of the insects seems to them a much better reason for the trouble of collecting than their value in the cabinet of the entomologist. Amongst themselves an idea is prevalent that the larvæ of coleopterous and other insects form excellent food to give occasionally to young children, and hence in my rambles I meet, not unfrequently, persons employed in collecting larvæ for this purpose. A species of toad found in the rotten or hollow trunks of trees during the hot months is eagerly sought after by the young men in the army who are being trained to the use of the bow, and to whose bones and sinews it is supposed to give additional strength. The children in the different villages are very useful in assisting me with my collections, and the common copper cash of the country is an excellent coin for such purposes. One hundred of this coin is only worth about 4½*d.* of our money, and goes a long way with the little urchins. A circumstance connected with transactions of this kind occurred one day which was so laughable that I must endeavour to relate it. In June last the boat in which I was travelling was made fast to the side of the Ningpo river, near its source among the western hills, in the province of Chekiang. As I went out on my daily rambles, I told all the little fellows I met that I would return to the boat in the evening, when I would be happy to pay them for any rare insects they might bring me. In the evening, when I returned and caught a glimpse of my boat, I was surprised to see the banks of the stream crowded with a multitude of people of all ages and sizes—old women and young ones, men and boys, and infants in arms were huddled together upon the bank, and apparently waiting for my return. At first, I was afraid something of a serious nature had happened, but as I came nearer I observed them laughing and talking good humouredly, and guessed from this that nothing had gone wrong. Some had baskets, others wooden basins, others, again, hollow bamboo tubes, and the vessels they carried were as various in appearance as the motley group which now stood before me. "Mâ jung! mâ

jung!" (Buy insects, buy insects,) was now shouted out to me by a hundred voices, and I saw the whole matter clearly explained. It was the old story, "I was collecting insects for medicine," and they had come to sell them by the ounce or pound. I had unintentionally raised the population of the adjoining villages about my ears; but having done so, I determined to take matters as coolly as possible, and endeavour either to amuse or pacify the mob. On examining the various baskets and other vessels which were eagerly opened for my inspection, what a sight was presented to my view! Butterflies, beetles, dragonflies, bees—legs, wings, scales, antennæ—all broken and mixed up in wild confusion. I endeavoured to explain to the good people that my objects were quite misunderstood, and that such masses of broken insects were utterly useless to me. "What did it signify—they were only for medicine, and would have to be broken up at any rate." What with joking and reasoning with them I got out of the business pretty well. As in all cases I found the women most clamorous and most difficult to deal with, but by showing some liberality in my donations of cash to the old women and very young children I gradually rose in their estimation, and at last it being nearly dark we parted the best of friends. I have been placed in circumstances somewhat similar on various occasions since, but I have hitherto managed to come safely out of the scrape. Sometimes amongst all this chaff there are grains of Wheat, and not the least striking is the beautiful Carabus cœlestis which was exhibited by Mr. Stevens at the Entomological Society's meeting in April last, and which I observe duly reported in the columns of the *Gardeners' Chronicle* which has just reached me. *R. F.*

Societies.

LINNEAN, *Nov.* 7.—The President in the chair. T. F. Robinson, Esq., was elected a Fellow. Various donations of books were announced; also an extensive collection of Australian plants, formed by Sir George and Lady Grey, presented by the Wellington Athenæum of New Zealand; and a monstrous specimen of the common Mushroom, bearing a second pileus in an inverted position on the top of the normal one—this specimen had grown out of a brick wall in the nursery of Mr. W. Taylor, of Park Village West, Regent's Park, by whom it was presented. Mr. S. Stevens exhibited a cone of Araucaria Cooki from New Caledonia, and also the caudex; with specimens of the male and female fructification of the curious Fern-like cycadaceous plant, Stangeria paradoxa, from Natal. Dr. Alexander exhibited specimens, from Mr. Wilson, of the fibre of the following plants, prepared in the Botanic Garden of Bath, Jamaica, namely, Bromelia Karatas and Pinguin, Tillandsia serrata, Yucca aloifolia and gloriosa, Musa coccinea, paradisiaca, and violacea, and a species of Sida. The samples were accompanied by letters dated Aug. 8 and Sept. 25, 1854, and addressed to Dr. Alexander, of which the following are abstracts:—"Textile plants now engross all the talk. This description of plant grows here spontaneously everywhere; and by good, or even very indifferent cultivation, might be made to yield large profits. My estimate of an acre of Plantain fibre is this—say an acre will contain 435 plants, at 10 feet apart; the second year each stool would throw up 3 suckers at least, each of which would produce about ½ lb. of fibre, = 1087 lbs. per acre. The fruit would sell for from 3*d.* to 6*d.* per bunch, thus realising at the lowest 13*l.* 10*s.* 11*d.* This is a very low estimate of the Plantain's capabilities." "I have already prepared fibre from 20 different species, and perhaps might discover 20 others. Those you mentioned, such as the Urtica tribe, produce excellent fibre, but not in quantity sufficient for profitable cultivation among a lazy people. I was agreeably surprised lately by finding so large a quantity of fibre in a species of Sida (S. mollis); it is most admirably adapted for cultivation in any soil or situation. There is also another plant, a species of Triumfetta, a nuisance on every wayside, which produces splendid fibre. I shall be glad if you will show the accompanying samples to the Linnean Society, as it may be the means of attracting attention to a new and profitable article of cultivation in this unfortunate island. We require something to renovate us." The samples consisted of tough fibre of considerable fineness. Papers on the embryo of Nelumbium, and a note on Cephaloteæ and Belvisiaceæ, both by B. Clarke, Esq., F.L.S., were read. They were illustrated by good magnified drawings.

Notices of Books.

Elliot's Fruit Book; or the American Fruit-Growers' Guide in Orchard and Garden. By F. R. Elliott. New York: C. M. Saxton, 152, Fulton Street. 8vo., pp. 504.

THIS is a compendium of the history, modes of propagation, culture, &c., of fruit trees and shrubs, with descriptions of nearly all the varieties of fruits which are cultivated in America; together with notes of their adaptation to localities and soils, and also a complete list of fruits there thought worthy of cultivation.

The work is intended more especially for the western states, and there it is likely to prove useful; for it would appear that many varieties of fruits that are esteemed first-rate in Europe, and even in the eastern states of America, are considered inferior in the western states; where, on the contrary, some varieties are grown and accounted excellent, which in England are known to be comparatively worthless. It is therefore evident that throughout the vast extent of America, local treatises on fruit trees are necessary in order to point out those sorts of fruits that prove best suited for the respective localities. "It is for the West, then, more especially, that our work is destined," says the author, in his introductory remarks. Nevertheless, some extracts may prove interesting to our readers. We are told that, before the West was, *i. e.*, settled by white men, the impression prevailed, among other errors connected with fruit culture, that "he who plants Pears, plants for his heirs;" and we well recollect being told when a boy, on planting out a young Pear tree, that possibly our children might eat of it, but we, never. Such prophecy, however, failed in our case, as nearly all others, for we have eaten often of it. And now, whether we attribute it to the locomotive age, to the active minds of our eastern brethren, or the spontaneous growth of the west—aided by her industrious denizens—we hardly wait for the season to come round ere we eat of the fruit; our own experience having been to receive the trees and plant them in March, and eat of the fruit in November following. Let this be attributed to what it may, such is now the impress, that no one buys a city lot, intending to keep it over one year, but he plants trees upon it, expecting and reaping the fruit thereof."

According to information obtained by the author from Dr. J. A. Kennicott, it appears that "the first permanent settlements in Illinois were made by the French about 1682, in and about Kaskaskia and Cahokia; and it is said that the first generation of trees there planted had done good service, and gone the way of all living long before the advent of the present race who people 'Lower Egypt.' The Rev. John M. Peck (whom I quote from memory), affirmed that he ate most luscious fruits, some 20 or 30 years ago, the product of the second generation of these old French trees, even then almost of forest size. From this you will perceive, that Illinois is one of the oldest fruit-growing states; and it is very certain that our seedling trees generally yield better fruit than the mass of chance varieties in the east; though, good sooth, I have been unable to trace any of our celebrated varieties in cultivation, to those glorious old trees so graphically described by the Rev. Mr. Peck; and yet, I am by no means certain that some of our most valuable local varieties did not originate in that classic fruit land of Southern Illinois.

"Many of our varieties of the first trees transplanted in western Illinois, and southern Wisconsin, were disseminated by tree pedlars from the region of the Wabash, in Indiana and central eastern Illinois; and I am only aware that some of the sorts came from Ohio, and others from Kentucky, Virginia, Tennessee, and North Carolina, and a few doubtless from the eastern states; though what proportion, or what varieties of those brought us by these tree pedlars I am unable to determine. Very few were sold under Eastern names, however; and now and then a variety is doubtless of native origin."

Chapter 2d of the work contains such instructions, as are usually given for propagation by budding, grafting, &c. The instructions for transplanting trees seem to be much wanted in that part of the world; for the author remarks that "Notwithstanding our people are, as a nation, 'planters of trees,' yet how few, comparatively, ever succeed in carrying the existence of trees planted, beyond the first season; or if a second year, only with a puny sickly habit, anything but satisfactory. The first thing, in the removal of trees, should be care not to destroy the roots in digging. Small trees are less liable to injury from such cause than large ones; but too often have we seen them wrenched out of the ground by the strong arm of man, apparently not to injury of roots, but really they were cracked through every portion, and all the pores [vessels] broken and injured, often as much or more to injury of the tree, than if one-half the roots had been cut off." "With nearly all trees and locations fall is the best time to plant," especially it is stated as regards Cherries. The principles given for pruning are very good, being a translation of those laid down by M. Dubreuil, of Rouen, whose ground-plan of a fruit room, and remarks on keeping fruit, we also recognise.

"Orcharding, as relating to the Apple, has become well understood, and no one who has land in any way suited now hesitates to plant. We have no certain data, but think we do not overstate when we say, that, besides large quantities imported from eastern states, there are propagated and planted annually over 6,000,000 trees in the States of Ohio, Michigan, Indiana, Illinois, and Wisconsin. The western country is already producing by millions of bushels, and her 'orchards,' so to speak, are not yet planted. Such is the value placed on fruit, such the rapid increase of people in cities that no one should be at all deterred from continued planting; for, we have not only the wants of an increased population of our own land to supply, but that of foreign countries. Although the Newtown Pippin, as sent from the Pell orchard, on the Hudson River, has done much towards establishing our reputation abroad, we anticipate an advance in good favour, when the same variety grown on our Southern Ohio, Kentucky, Indiana, and Illinois soils, shall be shown; for certainly their Apples are, like all our western growths, when compared with those of the east, far superior in size.

"The puberty or fruit bearing age of the Apple tree varies according to variety, climate, and cultivation. In the rich deep soils, and under the clear sun of our western states, most varieties come into bearing at about eight years from the bud; or about four or five years from planting out. We speak here only of the cultivated varieties. Wild seedlings would probably require from 12 to 15 years."

The varieties of each kind of fruit are divided into three classes—1st, those worthy of general cultivation; 2d, new and untested, or adapted to certain localities, or amateur gardeners; 3d, those unworthy of cultivation. This is a good arrangement as regards utility; for many excellent first-rate sorts, as regards flavour, and highly esteemed on that account by private growers, would only deserve a second or third-rate character in a pecuniary point of view, which is the principal one in growing for the market. In the third class the author includes those which, in his opinion, ought to be entirely avoided by the Western planter.

In the first class of Apples, many are unknown to us; a considerable number have been tried in this country, some of which have been found good, others not worth growing. Those that have proved good in our climate are the Reinette du Canada, Cornish Aromatic, Dutch Mignonne, Gravenstein, Early Harvest, Pomme Grise, Red Astrachan, Rhode Island Greening, and Boston Russet. Of these, we believe there are only two of American origin, namely, the Early Harvest and the Rhode Island Greening.

On the other hand, we find classed as unworthy of cultivation some of our most esteemed English varieties; for example, the Beauty of Kent, Bedfordshire Foundling, Blenheim Pippin, Cornish Gilliflower, Dumelow's Seedling, Golden Reinette, Golden Harvey, Golden Pippin, Hawthornden, Scarlet Nonpareil, Old Nonpareil, Summer Golden Pippin, &c. These comprise a number of our very best Apples, and that they should all prove so inferior in America is surprising. One would suppose that they had not been fairly tried, or that the true sorts had not been obtained by the growers in the western states. This is not improbable. Judging from the figure and description of the Herefordshire Pearmain, p. 85, it is very doubtful whether they have got that sort correct. The shoots are described as slender; but in the true sort, grown in even moderately rich soil, they are not so.

Several new sorts of Cherries and Plums are described; and as American varieties of these kinds of fruits succeed better in England than their Apples do, we shall refer to the work before us at an early opportunity for some notice of them.‖

Garden Memoranda.

MR. SALTER'S, VERSAILLES NURSERY, HAMMERSMITH.—Those who are interested about new Chrysanthemums cannot do better than pay a visit to this nursery at the present time, while Mr. Salter's fine collection is in bloom. It contains all the novelties of importance both of last year and this, and will be found well worth inspection. The following are a few of the best of such as were in blossom on Monday last. Large flowered kinds: Auguste Mie, reddish salmon; L'Ingot d'Or, yellow; Albin, dark claret; Trilby, blush; Chevalier Dumage, golden yellow, large and showy; Cassy, red and orange; Triomphe du Nord, reddish chestnut; Bossuet, rose shaded with violet; Rolla, rosy purple, tipped and mottled with silvery markings; Conspicuum, shaded rose; Madame Lebois, delicate peach; Phare de Messine, dark chestnut; Hermine, blush tipped with rose, and one of the most beautiful of this year's flowers; Le Prophète, yellowish buff; Prince Jerome, yellow and brown; Duc de Rohan, light crimson; and Eclipse, straw-coloured. Pompones: Riquiqui, deep plum colour; Pluie d'Or, dwarf yellow; Hélène, rosy purple; Doctor Duval, reddish chestnut; La Vogue, yellow with a brown centre; Madame Rousselon, delicate peach; Hector, dark orange buff; Comte Vigier, pale buff; Mdlle. Elkington, fine white; Rose pompone, quilled pale lilac; Reine des Anemones, fine white; Consuolo, yellow; Berrol, sulphur, suffused with rose; John Salter, dark reddish orange; Brilliant, reddish scarlet; Bayardiere, buff, suffused with silvery markings; Rosita blush lilac, Precoce, deep rose; and Mon. Bijou, pale fawn, shaded with lilac; Hybrids, *i. e.* crosses between the Pompones and large-flowered kinds: Marabout, fringed white; Cedo Nulli, white, with brown centre, a pretty kind; Marceau, lilac-tipped white; Bernard de Rennes, dark fawn; Golden Drop, yellow Anemone-flowered sort; La Radieuse, rose, with white centre; Madame Passy, rose, shaded with lilac; Aurore Boreale, yellowish buff; Berthile, lilac bordered white. These in general have larger flowers than the Pompones.

Among other plants, Manula oppositifolia was still covered with multitudes of starry white flowers, which last long in perfection. This was stated to make a good bedding plant. Chrysanthemum frutescens luteum and album are also reported to form dense masses of blossom in the flower-garden in summer, and if lifted and potted before the frost injures them they make good winter flowering greenhouse plants. We also remarked several handsome Veronicas in the way of Andersoni in bloom. When well grown these make pretty objects at this season of the year.

THE PAMPAS GRASS.—We understand that in the garden of Miss Gurney, of Northrepps Cottage, Cromer, there is now a noble specimen of the Pampas Grass, which has grown there without any protection. The plant was given to this lady three years ago by Sir W. Hooker. There were five flower spikes 12 feet high The foliage also has a most striking appearance, and the plant covers altogether a very large space of ground.

FLORICULTURE.

CINERARIAS.—The following are the particulars of the mode in which I cultivate my Cinerarias. In raising seedlings I make my first sowing not later than the middle of March, in a mixture of loam and leaf mould, with a little white sand, in seed pans well drained. I then place the pans in a pit or frame, with a slight bottom-heat, giving plenty of air in warm days. As soon as the plants appear above the soil, I keep them shaded from bright sun, and when large enough to handle, I pot them singly into 3-inch pots, and place them again in their former situation, keeping the lights closed for a day or two till the plants get established in their pots. I then remove them to a cold pit, keeping them shaded and giving them plenty of air. As early in May as the weather permits, I place them in the open air under a north wall, and as soon as the plants are hardened to the open air and the pots filled with roots, I repot them into 5-inch pots, in which they remain till the pots are filled with roots, and the plants have thrown up their flower stems about 2 inches, when I repot them into 6-inch pots, and cut the flower stem out close to the surface, which causes the plant to throw out from 10 to 15 side shoots. Some of these I thin out according to the strength of the plant. I keep them shifted into larger pots as the former become filled with roots, and early in September I give them their last shift, and place them in a cold pit and keep them shaded. By the first week in October they begin to flower. I have plants treated on this plan measuring from 3 to 4 feet in diameter, (!) with beautiful dark green foliage, and leaves from 8 to 10 inches across, and they remain in full beauty from September to May. The soil which I use is turfy loam from a rich old pasture, two parts leaf-mould, and one part sheep dung, one year old, with a little white sand, all well mixed but not sifted. I use the turf in as large lumps as I can conveniently place round the ball. I also use plenty of crocks, and place a little moss over them to keep the drainage clear, for nothing is more injurious to Cinerarias than stagnant water at their roots. I water with clear liquid manure about every third time during the summer. In preserving old plants, I cut the flower stems off as soon as they have done flowering, and place them in a growing heat. They soon throw up plenty of suckers, which I take off and pot in the same manner as the seedlings, and I find that they make equally good plants. I should add that I make my second sowing about the middle of April. *W.*

AURICULA INSECTS.—I am much troubled by the attacks of an insect upon my Auriculas, the roots of which it eats through near the surface of the soil, and the mischief is only first discovered by observing the plant to fall on one side, when it will be found, perhaps, to have only one fibre of root left. In the year 1850 I lost many plants in pots in this way, and on removing the earth I found from five to nine fine fat maggots in each pot, very like those found in hazel nuts. Some of these, together with a quantity of the detached roots, I placed in a garden pot covered with a plate of glass, and in May or June of the following year they changed to beetles, two of which I send for your inspection, together with some larvæ just discovered, which appear to me to be the same kind, although these have not attacked the roots very near the surface, but were found deeper in the pots, some near the bottom, but most of the roots are eaten through, leaving about half an inch attached to the plant. If you will examine them, and can give me any information which may enable me to guard against their depredations, you will oblige *A Constant Reader.*

[The insects complained of are the perfect beetles and larvæ of the common weevil, Otiorhynchus sulcatus. The most advisable plan, perhaps, for arresting the ravages of the larvæ is to repot the plants, employing earth which has been carefully sifted, as well as sifting that removed from the pots, so as to collect the larvæ, which must be destroyed. The roots of the Auriculas must also be carefully shaken. The perfect insects, from their dark colour and nocturnal habits, are very difficult to be captured.]

WINTERING THE CARNATION.—No one, I should imagine, who has at all studied the nature of this plant will doubt its perfect hardiness. Carnation-frames do not require guarding so much from frost as from excessive wet. My own frames are constantly thrown open when the atmosphere is clear and dry, though the frost may be severe. I prefer narrow frames of considerable inclination, hinged to a hanging stile at the back, to the ordinary Cucumber-frame; for when the lights are propped in front 2 or 3 inches, there is still sufficient slope to throw off the rain. Such frames, after being placed in an aspect as near north as possible, are filled as close to the top as will allow the lights to be closed if necessary without crushing the plants, with finely sifted cinders, which are watered with a rosed watering-pot, and rendered somewhat firm by gently beating with the back of a spade. They are then holed with a hollow tapering tube of tin or copper, which is, in fact, the old-fashioned Tulip-planter, and the pots are plunged to within about half an inch of their rims. By this means a cavity is left below the bottom of the pots which ensures perfect drainage. The surface-soil can be kept moderately dry, as the roots receive sufficient moisture through the sides of the pots from the surrounding bed of ashes, rendering watering unnecessary from the time they are finally arranged, about the end of October, until the first genial shower from the southward, in the latter end of January or beginning of February, occurs, when it may be permitted to fall on them for an hour or two together. Plants so wintered will be found to resist the cutting east winds of March, and, of late years, of April also, better than those which have been rendered tender and delicate by injudicious confinement, and which are excited to premature growth by winter and early spring sunshine. *J. W. N.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—The prevalence of cold damp foggy weather will necessitate a rather free use of fire-heat in houses occupied by a miscellaneous collection of plants in flower. Use this, however, as sparingly as can be done with a proper regard to maintaining a comfortable temperature and preventing injury from damp. Most plants will do very well if the temperature is maintained at about 45°, and very little fire-heat will be sufficient to affect this. Let the plants be looked over and watered early in the morning, so that a little air may be given for an hour or two in the forenoon, in order to get the house dry before night, when a rather low temperature will do no harm. Roses for early forcing should by this time be pruned and placed under shelter, where they will be at least protected from heavy rains, for a few degrees of frost will not injure them. Let them be freely exposed to air on every favourable opportunity. Where common shrubs are used for forcing, these should be taken up and potted, if not already done, placing them in a cold pit, or some sheltered situation for a few weeks after potting. COLD PITS.—Those who have adopted the coddling system with their plants will now be experiencing its bad effects in the susceptibility of the plants to damp, &c. Air should be given here whenever the temperature is a few degrees above freezing, throwing off the sashes altogether on mild dry days, and raising them slightly on the sheltered side when cold winds prevail. The watering-pot will hardly be necessary here until the sun becomes more powerful, but if any of the plants should appear to be suffering from dryness let a little water be given on the morning of a fine day, and avoid wetting the foliage, &c., more than cannot be helped. Be prepared for sharp frost in the way of having sufficient covering materials at hand and the walls of the pits well thatched or otherwise rendered impervious to frost.

FORCING DEPARTMENT.

VINERIES.—Where ripe Grapes are wanted early in spring, forcing must be commenced at once. Attend to former directions, and endeavour to get the root action a little in advance of the top; also secure plenty of moisture in the atmosphere, either by means of a bed of fermenting materials inside the house, or in some other more convenient manner, for there will be no moving Vines at the present season without a thoroughly moist atmosphere, particularly those that have not been started so early formerly. If the roots are outside the house the border must be well protected from the weather by means of wooden shutters or some other contrivance, and a little warmth must also be communicated to the soil. This is best done by having the border chambered, and hot water pipes under, which is doubtless the most economical arrangement in the end; but, in the absence of this, fermenting materials must be used. Let these be covered with something to throw off wet, and keep the fermentation as steady as possible. Do not exceed 50° at night by fire heat, raising it about 10° during the day, and with sun-heat an increase of 20° may be allowed. FIGS.—Keep trees that have ripened their wood cool and airy, but do not expose them to frost, particularly where the future crop is visible. Get the trees thoroughly cleaned and painted, and the house put in readiness for forcing by the time when it may be wanted.

FLOWER GARDEN AND SHRUBBERIES.

Finish planting the beds with their winter and spring occupants as speedily as convenient in order to allow the things any remaining chance of making a few active roots before severe weather sets in. Also take advantage of dry days for clearing and trimming up shrubberies, American beds, &c., for the winter. But if it is intended to remove any of the shrubs, or to plant others, get this or any other projected alterations done first, in order to avoid having to tread upon and disfigure the ground after putting it in order for the winter. Let newly transplanted things receive a mulching of rotten leaves to protect their surface roots from the bad effects of drying frosty winds, and the mulching will also serve to enrich the ground and enable the plants to start away more freely next spring.

HARDY FRUIT AND KITCHEN GARDEN.

Any planting of young trees, or removing of others which may have been unavoidably delayed, should be proceeded with at once, for all such work should be finished in the course of this month at the latest. See to thoroughly securing recently-planted trees, whether large or small, against the wind; for if left to be rocked about, the roots are sure to be greatly injured, and many of the active fibres broken off as soon as they are formed. Pruning and nailing should now be expeditiously proceeded with every fine day, if at the expense of delaying some of the other work which can be done with less discomfort in any state of the weather; for it is most important to get this done when the hands can work at it with some measure of comfort. Nailing is a cold enough job for even a fine winter's day; but to turn men out to it in cold, wet weather, and expect them to do a fair day's work, indicates a total want of good management.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the week ending Nov. 23, 1854, as observed at the Horticultural Gardens.

[Nov.	Moon's Age.	Barometer.		Temperature.					Wind.	Rain.
				Of the Air.			Of the Earth

The highest temperature during the above period occurred on the 28th, 1828—therm. 60 deg.; and the lowest on the 29th, 1846—therm. 16 deg.

Notices to Correspondents.

ASPARAGUS: *E F.* Plant it about the beginning or middle of March. Any respectable nurseryman can furnish you with plants. We never give prices, which is the business of advertisers.‡

BOOKS: *A Lady.* Neill's "Fruit, Flower, and Kitchen Garden."‡

ARALIA JAPONICA: *An Old S.* Loudon's "Encyclopædia of Plants" necessarily wants every novelty. The plant in question is a hardy undershrub, with magnificent deciduous foliage, and thrives in a damp American bed. Its flowers are white and unimportant.

DOUBLE ESPALIERS: *Sub.* From what has been observed of these, single espaliers are preferable You have after all only two sides fully exposed to light, in double espaliers; the other two shade each other, and the foliage on these will consequently be imperfect. You can, however, try whether one tree with good foliage on both sides is not better for fruit than two trees with half their foliage comparatively bad. The two espaliers forming the double one should be about a foot apart; and then the sides of the trees that face each will do little good.

FRUIT TREES: *Enquirer.* Of the different kinds of fruits which you wish to plant against your south aspect wall 90 feet in length, you may try with probability of success, even in your part of the country, the Noblesse Peach, Glou Morceau, and Knight's Monarch Pears, Greengage Plum and Ribston Pippin Apple, which should be on the Paradise stock, as the space is rather limited. ‖

GAS TAR: *Z Z.* If you wish to kill your trees you will use this material; not otherwise. Walls ditto. No doubt you will kill the insects also, if that will be any satisfaction.

HORTICULTURAL SOCIETY: *A Well-wisher.* The point you argue has been often discussed. We will have your letter laid before the Council, which is the best way of giving practical effect to your suggestions.

IMPORTED CAMELLIAS: *S A.* Wash them very clean, roots and all. Prune neatly the broken roots, leaving the fibres untouched. Pot them in peat and loam, one of the first to two of the last, and place them in your greenhouse, taking care that the pots are thoroughly drained, and kept damp, not wet.

MANURE: *A A.* No manure is better than that made from the runnings of the stable soaked up by leaves, peat, breeze, charcoal dust, or any similar material.

NAMES OF FRUITS: *J B H.* The name of the small Pear, if it has ever had one, is unknown. The fruit is, perhaps, the produce of a Pear stock that has been allowed to grow instead of the graft. The fruit is not ripe, so that its flavour cannot now be ascertained.—*W P., Elsenburn.* 1, 8, 21, Winter Nelis; 2, Napoleon; 5, Glou Morceau; 7, Passe Colmar; 15, 22, Chaumontel; 18, Old Colmar, so is 13 probably; 19, St. Germain; 2, Sturmer Pippin; 4, Carlisle Codlin; 5, Wyken Pippin; 6, Downton; 8, Alfriston; 9, Herefordshire Pearmain; 10, Northern Greening.—*Shalford.* 1, Frangipane; 2, Bezi de Montigny: 3, Doyenné Blanc; 4, Probably Napoléon; 5, Glou Morceau.—*J F.* 1, Golden Reinette; 2 or 3, Red Astrachan, these numbers were found detached; 4, Bezi de la Motte.‖

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* 1237, Alliaria officinalis; 21, Arabis albida; 77, Æthionema Buxbaumii; 676, Cochlearia officinalis; 43, Coringia austriaca; 138B, Conr. perfoliata; 138A, Conr. orientalis; 69, Alyssum micropetalum; (B), A. Aucheri; (A), A. hirsutum; (1), A. umbellatum; 1213, A. sarranicum of Besser; 939, Cakile maritima; 62, Erophila spathulata; 1262, Iberis taurica; 93. Hesperis laciniata; there is also H. runcinata without a number; 623, Erysimum lanceolatum; 62, Erophila spathulata; 724, Dentaria quinquefolia; 639, Cardamine pratensis; Alyssum A, Alyssum hirsutum; Al. I, Alyssum umbellatum; 1238, Draba glabri-siliqua; 19, Dr. Aizoon; 73, Barbarea arcuata.—*Phyllis.* We fear your books are very much out of date. Peristylus viridis is also called Habenaria viridis and Orchis viridis. Order your gardener to catch the mice with a common brick figure-of-four trap. Any countryman can make it, and it costs nothing.

ORCHID-HOUSE: *Dublin.* The dimensions given appear to be suitable except the width, which should not be more than 12 feet. By all means have two compartments, in order to have a house at pleasure hotter than the other, and for resting plants. You say nothing about ventilation, which is all important; efficient means of securing that must therefore be provided.‡

THE BULRUSH: *Geo Peeke.* The Bulrush is Typha; the common rush is not used at all; what is called a Rush and used in chair-making is the round-stemmed Scirpus lacustris.

TOWN SEWAGE: *Doubtful.* Our friend Mr. Mechi's opinion is entitled to the utmost respect; but it is an opinion and no more. We do not agree with him. The metropolitan case is quite peculiar, and surrounded by impediments which we believe to be insuperable. If, however, Mr. Mechi, or anybody else, can *prove* that we are wrong, no one will be better pleased than we should be. But until the thing is done we must adhere to our belief in its practical impossibility. Its theoretical possibility we shall not dispute.

WATER PLANTS: *T J H.* Valisneria spiralis is the most suitable plant for your small basin which contains gold fish.‡

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made.

SUPERPHOSPHATE COMPOST COMPANY.—427, Strand, London.

The Directors having received numerous applications for Winter Wheat Manure, have the pleasure to notify to their Friends and the Agriculturists generally, that they have 1000 tons expressly prepared for drilling with Winter Wheat, and now ready for delivery at 7*l.* per ton net cash, that is, payment in one month. Carriage free to any Railway Station or Wharf in London. Further particulars may be obtained of the Agents.

W. W. WATSON, Secretary.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.

WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 3*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6*l.* per ton, free to Railway.

They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.

Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.

Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.

BURGESS AND KEY,

103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.

103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.

103, Newgate Street, London.

SAMUELSON'S PATENT PRIZE FORKING MACHINE (Silver Medal from the Royal Agricultural Society of England, Prize from the Yorkshire Agricultural Society, Prize from the Cleveland Agricultural Society, and Prize from the Worcestershire Agricultural Society) is now proved by experience to be an invaluable implement for deep tillage, and equally effective as an extractor of Couch Grass and other Weeds, in testimony of which, numerous reports from farmers using it in every part of the kingdom may be had on application. Various imitations have failed, through the absence of its essential feature—the Patent Fork. The amount of horse power is less in proportion to the surface deeply pulverised than that required in the ordinary shallow ploughing. The application of steam power to tillage is still a problem to be solved, and it is not necessary to defer deep cultivation until its solution be accomplished.

SAMUELSON'S IMPROVED GARDNERS' TURNIP CUTTER (Prize for the ninth time, at the Royal Agricultural Society's Meeting, Lincoln, 1854). The improvement is a rasping plate for loosening and voiding dirt from the roots, whilst being cut, whereby the scouring tendency of root feeding is diminished.

B. SAMUELSON (Successor to late Mr. Gardner), Britannia Works, Banbury.

PRIZE MEDAL—1851.

AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 12th, 13th, 14th, and 15th of December next.

The PRIVATE VIEW and ANNUAL DINNER on TUESDAY, December 12.

PRIZE CATTLE SHOW of the SMITHFIELD CLUB.—The Annual Exhibition of Prize Cattle, Seeds, Roots, Implements, &c., will open to the public on Tuesday Morning, and closes on Friday Evening, 5th, 6th, 7th, and 8th of December, Bazaar, King Street, Baker Street. Open from daylight till nine in the evening. Admittance, One Shilling.

The Agricultural Gazette.

SATURDAY, NOVEMBER 25, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, Nov. 30—Agricultural Imp. Society of Ireland.

THE dryness of the summer in the eastern counties of England will be easily apprehended from the following facts of rain-fall at Boston. The total fall during the months of April, May, June, July, August, and September, in 1826 (the year of the well-known dry summer) was 8.7 inches: the amount which has fallen during the corresponding months of the present year has been only 7.3 inches; being less by 1.4 inches. But these counties, together with all that have suffered from an unprecedented scarcity of water, contain within their boundaries wide tracts of low ground and river valley, which in addition to the ills of drought are looking forward with painful apprehension to their accustomed winter floodings. The season is already here in which torrents begin to whiten upon the declivities of mountain and moorland, and the rapid streams which they fill are foaming through their rock-built bridges with a power betokening their capacity for demolition. In the deep valleys of the lake districts of North and South Wales, and among the precipitous moorlands in northern, central, and western England; along the banks of the Wye and Severn, the Avon, and the Trent, the Thames, the Ouse, the Nene, and the rivers north of the Humber—in short, wherever a stream plunges over its pebbly bed, or winds with spreading bosom through broad meadows and clustering towns—what anxiety will reign in the wet season for the safety of property, of flocks, crops, hayricks, bridges, embankments, mills, houses; even for the preservation of human life from the suddenly swelling waters, and from the sickness which follows their assuaging.

The scenes of past catastrophe are those which must look for forthcoming disaster; and the partial efforts and preparations made in these various localities will be generally unable to avert the evil; for without a measure of improvement providing efficient channels for the larger streams, so as to relieve the bordering lands of winter floods, no local remedies can be of much avail. We believe that only works of great magnitude can effectually relieve us from so many periodical inundations: but we also perceive a vast array of difficulties delaying or opposing operations of this character. Whatever may be the public feeling as to the proper parties upon whom the labour devolves, or as to the inability of landowners and other classes to bear the burden, we consider a general unwillingness and disaffection towards the work as being the fundamental obstacle. And, moreover, attributing this common apathy or antipathy for comprehensive river improvements to popular misunderstanding or want of knowledge of the subject, we are anxious to diffuse as much light as we can both by facts, wherever they are procurable, and by reasonings founded upon them.

To show that we enter upon our purpose with no violent prejudice against naturally-watered meadows, wherever and however they may be found, and with no rash condemnation of all mills holding back a rivulet to actuate their machinery, we will own that we know of various low meadow lands in the new red sandstone valleys which are a hundred times too contracted in extent to pay the cost of an opened channel to keep off their floods; which could not yield enough increase of hay to defray the expense of removing some small flour-mills now stopping their stream; and which, if completely deprived of the present Grass-producing winter floodings, would become of little value, because the soil is a light spongy peat, thinly covering a weak running sand; of poor promise if brought under the plough, and only to be tilled by a ruinous outlay of labour and pipe-tiles in cutting off the sand-rock springs that keep it "quick."

But to those objectors who say, "Confine TRUNK DRAINAGE to fens and swampy vales, but don't excavate your scientific rivers, with their longitudinal and transverse sections, their fixed slope of bank, &c. &c., among our undulating uplands and precipitous hills;" to such we reply, no!—we except no character of surface or elevation from the application of our principles; and wherever an estuary, a river, a brook, or a torrent may flow, there we would have a competent inspection and adequate provision for works of conservancy or improvement. Indeed, even in some of the most steep and rugged mountain districts, apparently the most unfavourable to all human interference with running waters, there frequently exist the very simplest opportunities for preventing overflow and disaster. Impetuously as the mountain streams come down, they sweep over a bed of rock that stoutly resists their power of attrition, and their declivity is so great that, often, the mere removal of a few large stones from a channel will relieve an entire valley from deluge. Works of the kind are rarely attempted, owing to the comparative unimportance of agricultural drainage in a tract fruitful only in stone and metals. Mining enterprise, however, sometimes effects considerable alterations in this way, as in the case of Llyn Llydaw, a lake more than a mile in length, and nearly half a mile in breadth, at the foot of Snowdon, which, by a deep cut made a year or two ago, was permanently lowered 15 feet, and this merely for the convenience of forming a roadway embankment across one end, leading to a copper-mine. *I. A. C.*

WILTSHIRE CHEESE-MAKING.

(Concluded from page 714.*)*

IN addition to repeated inspections of the dairy at Bentham, near Cricklade, we were gratified by seeing the whole process of manufacture at Calcutt, where everything that a careful, active, and intelligent superintendence can do is done in order to attain uniform excellence of quality.

Like the Gloucester, the North Wilts cheese is not a full milk cheese. The cream is taken from the evening milk before it is mixed with the new milk of the morning. Of course, the whole of the cream is not thrown to the surface in such a short time. In the month of June the average quantity of milk butter made from the 60 cows at Calcutt was about 100 lb. per week. Cheese is made once a-day. In summer the rennet is added to the milk at a temperature of from 80 to 86 degrees, according to the heat of the weather; after harvest, when the weather is colder, the temperature is raised to 90 degrees. In ordinary weather, a small quantity of skimmed milk is heated to bring the whole to the requisite temperature; but in sultry weather a little new milk is heated instead, as the skimmed milk which has already been kept 12 hours is more susceptible of change by turning over. Many people in Wilts like to have the milk at higher temperatures than we have stated when they add the rennet; but Mr. Sadler's dairy manager objects to any greater heat on account of warm coagulation having a tendency to make the cheese heave, and because she thinks that the richer the land is the lower the temperature should be. Mr. Sadler's pastures (Bentham) are very rich.

It is thought that an approximation to acidity in the milk is requisite for making the finest quality of cheese. To produce this condition in cold spring weather, a little sour whey is put into the milk along with the rennet. The rennet is prepared in spring for the whole season. A uniform quality, as regards strength of rennet, is thus obtained. On the average, about a dozen vells suffice for coagulating the milk of 20 cows. In this, as in all other good dairies that we visited in England, the vells are never used until they are a year old. As much arnatto is used as suffices to give the cheese a ruddish-brown colour. The arnatto is procured in bottles in a liquid state, and is applied by measure in order to ensure uniformity of colour. After the rennet and arnatto are added, an hour is allowed for coagulation. If the curd "come" in less time, it will be tough and hard. When the coagulation is sufficient the curd is carefully broken with a circular wooden skimming dish, which is put to the bottom and raised very gently upwards. The breaking is not quite so minute as in the Vale of Berkeley. The curd is allowed to settle a few minutes, and is then again carefully broken. If it be thought rather cold at that stage of the process, a little heated whey is poured over it and well stirred to raise the temperature to about 80 degrees. The part of the process which requires the closest superintendence and the greatest care is now over. The curd is again allowed to settle for a short time, after which it is cut across and heaped to one side of the tub that the whey may be drawn off. The whey is lifted in wooden bowls and poured through a hair sieve into the leads. The curd is repeatedly scored with a knife and again heaped to one side to allow the whey to drain off, and to facilitate this further the tub is raised a little at one side. The curd is afterwards cut into thin slices, well heaped up, and a cheese vat, bottom downwards, and with a 28 lb. weight inside, is placed upon it to press out the whey. This part of the process is analogous to the use of the "dreeper" in Ayrshire. In this state the curd is sliced and turned three times, and the vat, with the weight, is each time placed upon it. With that nice attention to cleanliness which is observable in every good dairy, a cloth is spread over the curd before the vat is placed

upon it. After these turnings, the curd is cut into thin slices and thrown on one side of the tub, where it lies about 10 minutes. It is thought desirable that the curd at this stage should have acquired a slight degree of acidity. An individual with an acute sense of smell will detect this acidity upon the blade of a knife that has been drawn through the curd, although the curd itself may not give the slightest indication of the change which has commenced. When the curd is ripe, a little salt—about 1½ lb. to the cwt.—is thrown over it, and it is broken by the machine. The cheese vats are placed under the machine, and are filled one above the other as the curd falls down. A cloth is put over each vat when the breaking is over, the curd is reversed in the cloth, put back into the vat, covered up, and placed in the press for about three quarters of an hour. After this, the cheese is taken out, and a cloth wrung out of warm water is put on it. It is again changed at two and at six o'clock, after which dry cloths are put on it. Care is taken that the cheese fills the vat properly. To accomplish this, the vats, at making up, are filled rather full, and the edges of the cheese are pared in the afternoon. Next morning the cheese is rubbed on both sides with salt, and the same cloth is put on again. On the third morning it is treated in a similar manner. The cheese is put into the vat without a cloth on the fourth morning, and a little salt is rubbed over it to keep it from adhering to the wood. After the fourth morning, it is reversed in the vat, without a cloth, each morning until the process is complete about the sixth or seventh morning. There are about 40 cheeses to change every morning.

The quantity of whey butter made in the Calcutt dairy during the five weeks preceding our visit averaged 26 lb. per week. In the Wilts, as in the Gloucester dairies, there are no artificial means resorted to in order to raise the temperature of the rooms for maturing the cheese. The rooms are kept in a cool and airy state. The necessity for ripening by any artificially raised temperature, must depend in some measure upon the mode in which the cheese has been manufactured.

We were very much pleased with Mr. Sadler's dairy utensils. There is no extravagance displayed in his establishment; but at the same time no expense is spared to have the most suitable utensils that can be procured. The presses are powerful levers, requiring little weight upon them. The leads are capacious, and are connected with the whey tanks in the piggeries by means of pipes. The vats, as in Gloucester, are turned out of solid Elm; and the large brass tubs are beautifully burnished. When carefully kept, a substantial brass tub may last a lifetime; and even when worn out, the material is of considerable value. Mr. Sadler's tubs at Bentham and Calcutt, were made at Marlborough, and cost 13*l.* and 15*l.* respectively. They have a clean as well as an elegant appearance.

Mr. Sadler's dairy manager objects strongly to cheese tubs of wood, because however carefully they may be scrubbed, they cannot be completely freed from portions of the milk or whey that have been absorbed by them, and which will afterwards emit products injurious to milk. We all know that milk is peculiarly susceptible of injury from a tainted atmosphere.

ANBURY AND FINGER AND TOES.

In all discussions on those disturbances in the tissues and external forms to which the roots of certain plants are subject, called indiscriminately anbury and finger and toes, much confusion arises from regarding as identical two disorders which, in all their indications, appear to be separate and distinct. This indiscrimination may have originally arisen from its having been observed that where the former existed the latter also appeared; but in the gouty and deformed appearance of the subsequent and subsidiary roots there might have been clearly discerned a diseased origin, distinct from that subdivision of tap-root, the effect of some external disturbance of form, unattended with the several signs of disease which invariably are displayed in anbury.

The very term anbury is derived from a disease to which horses are subject, which appears in the form of a wart or tumour on their legs or flanks; in roots its first appearance is that of a small knob, evidently occasioned by the puncture and deposition of its larva by some insect, for it contains the germ of insect life. As this germ becomes indued with life it causes such a perversion of the juices of the plant as to occasion distortion and corruption which is shown in the deformity and putridity of the bulb, and interruption in the regular flow of sap, as is seen in the flaccidity of the leaf. In this precise form, Turnips and the Brassica tribe seem only affected; the Carrot, though its root sometimes corrupts and becomes the prey of insects, yet, neither in this diseased state does it show these excrescences, nor does it send out subsidiary roots, the whole of its lower part rots away, its growth is stopped, and its leaves assume a russet colour; neither does the Parsnip appear liable to the same form of attack. In finger and toes there exist none of these signs of disease, the roots and bulbs retain their natural flavour and consistence, the leaves their pristine verdure; it is not confined to Turnips or the Brassica tribe—in fact, it seems generally not so much developed in them as in Carrots and Parsnips. It, indeed, seems to affect most those plants in which man has induced a supernatural grossness of root, and to indicate a disposition to return to the original wild form, as Professor Buckman has correctly observed with respect to Carrots and Parsnips.

But why should the wild root be predisposed to this malformation, this division of its roots? From this enquiry we may deduce the cause of this disposition in the cultivated root to return to its original form. The wild root, the occupant of uncultivated land, finds at a very few inches below the surface, an indurated, crude, unfertilised soil, and, in the early part of the year, possibly, one supersaturated with water, into which the roots of tap-rooted plants cannot enter, or, in entering, find no food, and where there is excess of water become decomposed; they then break into and spread out these subsidiary roots into the richer surface mould, taking on a form approaching to the fibrous; but as the undersoil parts with its moisture, these roots, obeying the great rule of their nature in seeking and following water, strike into the undersoil, and thus their ramifications retain their quality of tap-roots. Thus the farmers in Mr. Pearson's neighbourhood may be perfectly right in ascribing the forking of their Carrots and Parsnips to the use of long fresh dung. But, as he justly remarks, "What has this to do with finger and toes, as we understand the term?—with us it is a disease resembling the club in cabbages." A sort of a gardener I had some years ago complained he could never grow in my long-worked and old-fashioned garden a crop of Carrots that were not forked; I directed him to put the manure at the bottom of deep drills—he did so, and was so delighted with his crop that he travelled the whole adjacent country with samples to his brother gardeners.

With Mr. Pearson's so-called finger and toes, *i. e.*, his clubs, I do not believe the seed has anything to do, but with the disposition to return to a natural state and to early starting it has everything in the world, else our labours to improve the natural plant by culture must have been unavailing, and we know they have not been.

Mr. Deane's finger and toes are plainly anbury, and his dressing of chalk evidently was destructive of the anbury insect, as it was of the wire-worm; and in this, by long standing accounts, the efficacy of lime with some adjunct or other in the prevention of anbury is certain. In this Mr. Paine, of Farnham, concurs; for though he speaks of finger and toes, he certainly means anbury; but I think, notwithstanding his paper has all the support of a leading article, that he draws an inference on insufficient grounds, that the disease is due "to the condition of the soil, arising, probably, from its deficiency in certain inorganic particles." Mr. George W. Johnson suggests the application of hydro-sulphuret of lime as a preventive of both anbury and the attacks of the Turnip fly — here evidently intimating the destruction of insect life, not an alteration of the condition of the soil.

There may be something in Mr. B. Saunders' view on the cause of finger and toes (not anbury), and the deterioration of seed, in allowing the central umbels and spikes to seed; I think I heard a similar observation by a gardener very many years ago.

By referring to page 442 of last year's *Gazette*, it will be seen that I have there reported the fact of the whole of a thousand of Savoys having suffered most severely from anbury; while a Rape plant, which had accidentally been planted among them, escaped the disease; and while Turnips and Borecole, which were sown and planted all round them, were, without exception, undiseased. How can we account for all these having escaped disease, when it so totally prevailed in the Savoys, on the hypothesis of a defective inorganic structure of the soil?

I will conclude these observations by an extract, rather too long a one perhaps, but most pertinent to the subject, from Wilson's "Rural Cyclopædia:"—"Anbury does not arise from any imperfection or peculiarity in the seeds of Turnips. If two crops grow, in adjoining fields, from the same seed, the one may be much diseased and the other altogether healthy; and even when anbury attacks any one field, it very frequently makes but partial devastations, or appears only in small and isolated patches. Nor does anbury arise from any unfavourableness in the time of sowing, or from unpropitiousness of weather during the growth of the crop; for, if it did, it might be expected to make somewhat uniform and nearly simultaneous attacks in all districts of similar soils and character, and similarly affected by the supposed unsuitableness of meteorological circumstances to sowing and early growth; yet it is found to be both partial and capricious in its attacks upon some districts, occasionally very violent in a few, and either exceedingly slight or altogether unknown in many. Neither is anbury occasioned by any peculiarity in the composition or chemical action of the soil; for it occurs, in the same district, on soils of very widely different and almost contrasted character, and, in the same field, appears at uncertain intervals, or in one year totally disappears and in another breaks out and spreads with virulence. Anbury, when once known in any district, is most likely to appear in fields which have been frequently cropped with Turnips or which have quite recently produced either Turnips or Cabbages, yet it arises on such fields, only from the presence of the insect which feeds upon it, and not from any "tiring" or excrementitious poisoning of the soil by Turnip cropping, for it often does not devastate more than mere patches of an old Turnip field, and occasionally breaks out in fields which have not been previously cropped with Turnips during many years, or within the memory of man. *J. M. Goodiff.*

Home Correspondence.

Waste in Corn.—Permit a few remarks on the probable quantity of corn which predatory birds consume annually. We have several inquiring correspondents as to this particular, who, with us, consider it a subject of very great importance. A royal mandate, it is said, still exists in our statute book for their destruction, which is not repealed; if so, it ought to be put in force and made practicable. Many old people can remember taking the benefit of this Act, by demanding and receiving from the churchwardens of their parish so much a dozen for sparrows, larks, and linnets, or their eggs; also for various descriptions of vermin, &c. Some idea may be formed of the consumption of large birds, such as partridges, pheasants, ringdoves, rooks, pigeons, &c., from the old adage that "one sack of corn in a year will starve a pair of pigeons to death;" which holds strictly true, for let a pair of pigeons have constant access to four bushels of Peas, and allowed no other food, it will be found that all will be consumed before the year is expired; yet many gentlemen and farmers foster them by hundreds on a farm, regardless of the loss sustained by themselves and their neighbours, and finally by their country at large. It may also be observed that in all countries, with but few exceptions, pigeons abound to a more or less extent, so that the waste of corn by them alone in a universal point of view is beyond conception to unthinking minds. Partridges and pheasants, too, are great gormandisers; and, after all their extravagant cost for food, of what benefit are they, except to gentlemen sportsmen, who ought to maintain their game themselves instead of their tenants? A calculation may be made of what the myriads of small birds which infest this country consume, by ascertaining what a single pet bird eats, and by noticing what larger flocks devour on most farms and gardens in every neighbourhood. One half the crops of corn and seeds sometimes falls to the share of these depredators, and always too great a portion to be endured, though all means yet known may be taken to prevent it. It is not too much to say, though a startling fact, "that more corn is consumed by destructive birds and vermin, in most parishes where it is grown, than by the inhabitants themselves!" though what they eat is merely trivial to what they spoil in attaining that object. Excuses are often urged for the destruction of predatory birds, and especially rooks, intimating that they are designed by Nature to keep within due bounds insects, slugs, grubs, wireworms, &c. Granted that this may be a reasonable expostulation; but it is as unreasonable, in our opinion, to argue that we ought to foster them when they become a pest, so as to cause want of corn in a country, as it would be to contend that we ought to preserve wild beasts, rats, mice, and all other kinds of vermin, to devour what, it is said, we cannot grow half enough of to feed our population. It is more reasonable to suppose that Providence has wisely destined only harmless migratory birds, and not those of a predatory nature, such as swallows, martins, &c., for the express purpose of keeping down to a limited extent insects, &c., in the summer months, and others in the winter. Who ever heard or knew of cottagers and allottees, or gentlemen's gardeners, having the worse crops because rooks had not been permitted to enter their grounds? and who would not frighten them off on their first appearance? Who also do not try to scare small birds off their crops, for instance, the "old" sparrows, as they are sarcastically called, which (though not known to some persons) more commonly visit grounds near a neighbourhood than in lonely situations, where hawks and other birds of prey dare frequent with impunity, which would start them off in a jiffy. Hence we seed-growers have recourse, when we can, to growing their favourite dainties near a wood, where they (the seeds) are much safer than near the homestead; at the sight of a hawk they fly for their lives—not so at the presence of man, except he is provided with powder and shot. Gentlemen sportsmen had better study the interests of their tenants and country more, by fostering instead of annihilating such birds as hawks, magpies, jays, owls, and other birds of prey, which are known to gobble up whole broods of nestlings at a meal. Imagine one hawk, where such a solitary creature is to be found, to pounce on only a single bird in a day—recollect it is to get rid of 365 in a year! The cuckoo also is no doubt destined by the Allwise Creator to migrate from one country to another in due season, to destroy the eggs, in order to obviate an excess of predatory birds. Gamekeepers are also very fond of shooting cats; which ought not to be tolerated, although it belongs to their nature to ramble the fields a little, and now and then take a paltry partridge or rabbit, they are also, no doubt, created for the purpose of destroying mice, rats, birds, and other vermin, to a certain extent. In short, it is an insult to the Divine Being to destroy all those innocent creatures, and nail them on a barn by hundreds as examples of depredation, and as if they were a formidable class of his creation. It is much to be deplored that, in localities where woods and forests have been of late demolished, hawks and other birds of prey are nearly extinct; hence the cause, in a great measure, that so many more destructive birds are now known to exist than in years past. Suffice that we have said enough in this article to convince inconsiderate persons of the necessity of exterminating (to some extent at least) predatory birds, in order to avoid waste in corn. We reserve for a future paragraph our remarks on the still more aggravated waste of corn occasioned by the abominable practice of drinking to excess strong ale and ardent spirits. We hesitate not to affirm that sufficient corn is actually grown in our own country to supply its wants, and some to share for exporting occasionally, were it not for waste and extravagance by

thick seeding, encouraging predatory birds and destructive vermin, and indulging in strong drinks which are unnecessary for the real sustenance of human nature *Hardy & Sons, Seed-growers and Salesmen, Maldon, Essex.*

Notes from East York.—The past seed time has been unusually fine, and in many instances considered rather too much so, where the hard consistency of the land rendered it almost impossible to proceed with the ploughing preparatory to its being sown with seeds; the late rains, however, having obviated this delay, the sowing of autumn Wheat in this riding may be said to be fast drawing to a close, with the exception of some Turnip soils. Again the weather has been most propitious as regards the taking up and storing of roots, respecting which I would observe that Potatoes generally were a nice healthy crop, not having more than one or two per cwt. of diseased tubers; whilst Carrots were a very inferior crop, almost a failure in most cases that came under our notice. Mangold Wurzel pretty good, considering the season; though some runners might be diseased in every place where the root was grown, yet in our case, independent of this, upwards of 30 tons per imperial acre have been stored. The Turnip crops, I regret to say, are likely to prove far short of an average supply, more especially the Swede portion, which are seriously mildewed; and in the event of a severe winter setting in, which is by no means improbable, as we have already experienced some keen frosty nights and occasional snow showers, it will doubtless affect the value of Linseed cake and other feeding stuffs materially, and cause them to range at enormous high prices; thanks, however, to the valuable information contained in the papers which you lately published by your correspondent "Y," which we have taken a lesson from, by substituting Rape for Linseed cakes, and having carefully tested the quantity and quality of milk and butter produced by a given number of cows, we, after a fortnight's trial, come to the conclusion that there is no deficiency whatever; on the contrary, the quantity of milk has been rather increased by the use of Rape cake, and our feeding beasts are doing as well as might be expected; but the hogs that are on Turnips will not touch it. *P. Deane.*

Tests of Timber.—Having lately received some specimens of timber (hitherto unknown in this country) which seem to me, from their size, hardness, and freedom from shakes and flaws, to be well adapted for shipbuilding purposes and every other use to which Oak is suited, I wish to inquire through the medium of the *Agricultural Gazette* if there is any mode of testing their resistance to rot (wet and dry), marine worms, and all the other influences which destroy timber; and shall be glad—if such methods of testing timber are practised either at the Government or private dock-yards—if they are communicated through the medium of the *Agricultural Gazette;* or if there is any secret involved in them, that it may be stated on what terms such tests will be applied, and how long it will take to determine whether the timber subjected to these tests is or is not fit for the intended purposes. *J. G., Clitheroe.*

Agricultural Statistics.—You reported on the 11th ultimo a very interesting paper by Mr. Burnett, of Black Hedley; but I beg to demur to one of his suggestions, viz., to make a return of the stock and corn taken to market, instead of stating the probable gross yield of corn and quantity of stock on the farm at the time of making the return. As corn is frequently kept over the next harvest, a correct estimate of the annual yield could not be thus arrived at, and as to a large quantity being consumed on each farm, that might be an additional item, but should not be deducted from the estimated bulk of produce harvested. Again, as to stock, the market sales offer a very inadequate criterion of the quantity existing, as sheep, particularly, are often bought as lamb-hogs, and sold again as stores, so with young beasts; and many farmers do a bit of jobbing, so as to prevent this kind of statistics being of any value. The quantity of all kinds of stock on a given day enumerated as the census would be the simplest mode, and perhaps the least expensive. One other limit I would place in the kind of information given, viz., "the expenses incurred in producing" grain or other agricultural commodity; such inquiries would be useless for national purposes, they would be irritating and offensively intrusive. While advocating agricultural statistics, I would not on any account bring a hateful prying incubus on farmers' backs that would be difficult to shake off, and might be turned to the account of taxation projects or other arbitrary schemes of a nature partial and unjust; but simple information about the quantity of corn and meat produced and in stock is necessary to guard against wild speculation and unfounded fears, and may be obtained at little cost and without resistance, if the farmers will bring before their several representatives, the matter carefully considered as this paper of Mr. Burnett's. *J. W., Peterborough.*

Societies.

Royal Agricultural Improvement Society of Ireland, *Nov.* 7.—The Earl of Clancarty in the chair. C. W. Hamilton, Esq., read a paper *On High Farming in Scotland and the application of Liquid Manure*, from which the following are extracts:—"I shall now try to describe the most remarkable features in several of the high farms which I visited—such as Myremill, Cunning Park, Dunduff, Harvey's (at Glasgow), Lord Kinnaird's, Burnturk, &c.; in all these places the cattle are kept entirely in the house, and provision is made for saving, increasing, and distributing, by pressure through pipes, large quantities of liquid manure. In the three first, litter is not used to any great extent; in the last two, the box system is adopted, with great profusion of straw as litter. Mr. Kennedy's, of Myremill, near Maybole, contains about 650 Scotch acres—800 statute—with pipes laid over 300, at a cost of 2*l.* per acre. There are 70 acres of Italian Rye-Grass. The homestead and steam-engine are at the top of a hill; the water is pumped up from a river flowing at a considerable distance through the valley, and again discharged, loaded with manure and chemical compounds, containing ammonia, such as gas-tar water, &c.,* through iron pipes, which convey it, under great steam pressure, to hydrants or iron pillars, placed one in the centre of 6 acres or thereabouts, and fitted with valves or turncocks, where the liquid is discharged, at will, through very long tubes of gutta-percha, which are dragged about to every part of the 6 acres, and enable the labourer who holds the nozzle at the far end of the tube in his hand, to direct the shower to any part of the field he likes. This operation follows, during the summer, each day's cutting of the Italian Rye-grass, and it is thus that such immense crops are produced. Mr. Kennedy gets from four to five cuttings; he weighed portions this year to enable him to calculate the quantity cut on the very best part of the 70 acres, and states the cuttings to have been at the rate of—

	Tons.
First cutting	16
Second do.	25
Third do.	18 and expected from the
Fourth do., about	15
	74

He fed this year, since May 1, entirely in the house—
250 bullocks of 8 to 10 cwt., with 3 lbs. cake per diem, added to the soil.
460 wether hoggets, with 1½ lb. cake.
25 cart horses, from 1st May to 1st September.
100 to 150 pigs.

"The bullocks get from 112 lbs. to 150 lbs. of soil, the sheep from 10 lbs. to 12 lbs.; pigs and horses uncertain. Now, if we try these quantities we shall have the consumption on six months.

	Tons cwt.
250 bullocks getting average 131 lbs. per diem	1400 0
460 sheep at 11 lbs....	411 0
125 pigs, at 4 st. each	385 10
25 horses, at 4 st. each, from May to Sept. ...	77 10
	2274 0

Or somewhere about 32 tons per Scotch acre, or 25 tons to the imperial acre; and evidently a crop of 74 tons per acre would have required a double consumption by each animal, for the soil is all consumed and no hay made. The winter feeding of the cattle in the stalls is—two feeds of cut Turnips, about 80 lbs.; one feed of compound, consisting of ¼ lb. molasses, 2 lbs. Rape-cake, 1 lb. oil-cake, and a little Bean-meal with chaffed straw, making about 15 or 16 lbs. in all, and given at mid-day; uncut straw at other times. Mr. Kennedy's house-feeding of sheep seems to be eminently successful; the pens for 10 sheep are 12 feet by 6 feet, and the spars 2½ inches wide, and ⅞ inch interval; the space beneath for the dung to fall into is shallow, and without any current of air, and is flushed with water frequently to carry the manure into the tanks. The house is perfectly well ventilated; but those sheep flourish most which are farthest from the opening, and in the most equable temperature. Let us now turn to Mr. Telfer's, of Cunning Park, close to the town of Ayr; it is to this farm that I think we shall probably be indebted for the most accurate and reliable information. Mr. Telfer seems anxious to weigh, measure, and record accurately, and to have truth as his object. Cunning Park contains only 40 Scotch acres, of which 20 are under pipes, and 11 under Italian Rye-grass; it is a flat level surface, and consists of poor sandy soil, worth very little in its natural state; but the tiller of rich heavy loams must not imagine that, therefore, Mr. Telfer is working at a disadvantage. On the contrary, a porous soil seems to be the first condition for ensuring success, and every gardener who aims at the production of fibrous roots and luxuriant foliage in his forcing houses seeks for pure sand and the lightest of vegetable matters, as the medium for supplying the roots with water. The system of distribution is the same on all the farms visited, and one hydrant to about 6 acres. Mr. Telfer's is strictly a dairy establishment; and from being within a few minutes' walk of the flourishing town of Ayr, must, under any circumstances, be very profitable. No description can give an idea of the perfect order and cleanliness that pervades the whole establishment. The cowhouse contains 48 cows in a double row, two to each stall; the floor is entirely of white flags, kept as scrupulously clean as the kitchen of an English house; the drain behind the cattle is fitted with an iron perforated plate which lets the liquid pass off at once into the tank, while a shovel, made to fit exactly into the rectangular portion above the iron-plate, carries away all the solid manure, which is also conveyed to the tank. There is no litter used, but the forepart of the stalls is covered with thick cocoa-nut mats, which cost 10s. each, supplying two cows; and as some which had been down for three years seemed little the worse for wear, the expense of this substitute for litter is very trifling. The side walls are skirted with large slates as more easily cleaned, and there are many windows, both in the sides and roof, which open to give air, and have also blinds of cocoa-nut fibre, so ingeniously arranged, that pulling a slight cord enables the cowherd to darken the house whenever flies become troublesome. There is an air-channel underneath the floor, by which fresh air is introduced, as it is usually in churches. The food is brought in by the centre passage, in a large box, with three wheels which run over the flags with the greatest ease. There is no provision for supplying water to the troughs, and I believe that the expenditure, upon contrivances to give water to cattle by pipes, as at Mr. Littledale's, near Birkenhead, and Mr. Lawson's, at Burnturk, is not, in any way, to be recommended; for the small quantity that cattle living on green food drink can be easily brought in in buckets. The steam-engine, with its connected appliances for chaffing, steaming food, pumping water from the river, and again forcing the liquid manure through the pipes, is placed at one end of the byre, and the tank, which is open,° and surrounded by a high wall, is at the other; the weighing machine, very conveniently placed at one side, so that every cart must pass over it. The dairy is connected with the building, and has all the beauty of perfect fitness in every part, everything that is necessary for cleanliness and the regulation of temperature, and nothing that is not useful. Mr. Telfer gets the highest price for his fresh butter from a Jermyn Street dealer who supplies the nobility in that part of London, and this sufficiently shows its quality. Now, let us try to calculate what the produce of Italian Rye-grass may have been. The stock kept on the farm is 48 cows and two horses, which we may consider as equivalent to 50 head; his statement to me was that the cows get 4 stones of soil per diem, and 30 lbs. Cabbage per diem in summer, with one feed of compound, 4 lbs. to 8 lbs.—say, average 6 lbs.—of chaffed hay; 1 lb. to 3 lbs.—say, 2 lbs.—of oil-cake; the oil-cake all made into flour, and steamed with the chaff. In winter, grated Mangolds, fresh and not fermented, are substituted for the soil; the winter supply of hay is bought, and as the little hay that was made from the Italian Rye-grass was chiefly consumed before October, I think it safe, in the absence of more correct measurement, to include the summer hay in the produce of the 11 acres, at one stone and a half per diem to each; total consumption, five stones and a half, would be only 33 tons per acre. If 74 tons had been realised per acre, each animal must have consumed, at least, 14 stones per diem, independent of oilcake, on the supposition that the supply lasted six months, which it scarcely does. At Mr. Ralston's, of Dunduff, near Carrick, the dwelling-house and homestead are on a hill, and water is supplied from a still higher level. The tank is an open one, and surrounded by a wall, and cost about 30*l.*; and 50 acres are watered by the force of gravitation, which, as they are at a very much lower level, distributes the liquid manure from the hydrants with great power. The drawback is the expense of carrying the soil home, which is probably about five times that of Mr. Telfer's. Mr. Ralston has this year kept six Ayrshire dry cows, of about 5 to 6 cwt., to the acre, all the summer. Now, if each animal consumed six stones daily,† and the supply lasted six months, the acreable quantity would be about 40 tons. The next farm that I visited was one of Lord Kinnaird's, at Kindstown, in the Carse of Gowrie—the arrangements are calculated to effect the greatest possible consumption of straw, of which the Carse lands give an abundance. The houses are very large and ventilated freely by openwork slating; they are divided into boxes, 15 feet by 7, or 15 by 14, containing two or four beasts. The cattle are littered with straw in abundance, and the manure not removed until the end of the season. The racks, feeding troughs, and gates, are raised according as the manure heap rises. The divisions are three bars, which are also hung higher, like leaping bars, according as the manure heap rises, and are all removable for the purpose of carrying away the manure at the end of the season. Doubtless, an animal will thrive in a box, but there must be good ventilation, and a profuse quantity of straw used to keep the byre clean and sweet; and the question arises whether even the profuse quantity of Carse straw might not be better applied as food. The point here that attracted my attention most was that although there is a steam-engine, the liquid manure is driven through the pipes by a two-horse gear. There is but one hydrant to about 30 or 40 acres, and an immense length of 2-inch gutta-percha tubing. Italian Rye-grass does not suit the Carse lands, and the liquid is applied to Turnips, Clover, and pasture. The next farm was Mr. Lawson's, at Burnturk, in Fifeshire, about 7 miles south of Cupar. The system here is in some respects similar to that of Lord Kinnaird. The same abundant use of straw for bedding. There are both boxes and stalls—boxes for two, 14 feet 6 inches (including 2 feet troughs) by 10 feet; passage in front of two rows, 5 feet 5 inches. The troughs are fixed and the racks also fixed on the partition walls, and the manure cleared out every two months, which enables the animal still to use both trough and hay-rack. The stalls for two are 6 feet 9 inches wide, 9 feet long, including trough 1 foot 4 inches; channel, with iron grating, 1 foot 4 inches; back passage, 4 feet 4 inches.

* Gas-tar water, 20 proof, is mixed in the proportion of 1 to 400 parts water, thus fixing the ammonia in pure water instead of by an acid, and producing it at one-third of what it would cost in sulphate of ammonia. Mr. Kennedy attaches great value to leaving the liquid manure three months fermenting in the tank before it is used, and this is a very important feature in these systems.

° In these open tanks there was no visible disengagement of gas, and no smell of ammonia; there had been some accumulation of vegetable matter, which Mr. Telfer used sulphuric acid to reduce.

† 20 lbs. meadow hay = 120 lbs. Turnips; and, according to Mr. Telfer's calculation of 3.5,
6 stones soil=10 stones Turnips, or
=8 stones Turnips and 27 lbs. of Wheat straw.
—Johnston, p. 1029.

—32 head in each house. The feeding for each large bullock, in winter, was formerly 150, now reduced to 100 lbs. Turnips (and the reduction is found to favour health), 10 lbs. cut straw, 6 lbs. oatmeal, Bean-meal, or oil-cake, damped with water; no cooked food. In summer, Italian Rye-grass *ad libitum* twice a day, with 4 lbs. oil-cake. There are only 11 acres of Italian Rye-grass, and only one hydrant to supply the liquid. What struck me most as defective was the waste of room in these extensive and well-finished buildings, which accommodate only 60 head, and the expense which has been incurred in an elaborate system of pipes for supplying and with-drawing water for the animals to drink. The air-flues under the passages are very good, and have dampers to shut off the cold air in winter. The liquid manure tank is arched over, and the liquid might have been distributed by gravitation, but owing to the faulty construction of the delivery-pipes, can only be propelled by steam-power; and as the engine is a seven-horse-power, and requires one ton of coal per diem to work it, it is not as frequently used as the growth of the Grass would require.* The fourth cutting of Rye-grass seemed to me very poor indeed; but the bailiff told me that he thought they had got 60 tons per acre this season. This, however, was not from measurement. The last instance that I shall refer to, as showing the application of liquid manure, is that of Loughend meadows, near Edinburgh. They lie on one side of a valley, formed between Arthur's Seat and the high ground between it and Granton. The main sewer from Edinburgh discharges through an open course along the valley; this has been caught up at the level of half the declivity of these meadows, and conducted so as, for many years, to water about 20 acres of the lower parts, which are principally clothed with Couch and Poa trivialis. Of late years a contrivance has been made to water the upper part. The filthy stream is conducted under a small water-wheel, which elevates a large portion to the upper level, whence the liquid is distributed, both by means of the common irrigating channels, and also by a hydrant and hose, over the upper portion of the declivity sown with Italian Rye-grass, and divided by furrows into half acres, which are let to the cow-keepers of Edinburgh.† In the other instances which I have mentioned, the Rye-grass is treated as a biennial. The second year's sod broken up in November and sown down in the beginning of March. Here they have begun a system of renewing the Rye-grass by hoeing after the last cutting, and sowing fresh seed in the intervals between the tufts. The produce is estimated by the manager at 50 tons per Scotch acre. There is a good contrivance for carrying about the hose on a very large light windlass fixed upon a cart. I shall now briefly recapitulate what I think there is reason to consider as proved and what is not. I think it proved that by the constant application of liquid manure, at least from 25 to 30 tons of green Italian Rye-grass may be raised from the statute acre, equivalent to from about 7 to 9 tons of hay. Now, assuming 8¾ tons of Rye-grass = 2½ tons of hay to be a good crop under ordinary circumstances, we have a gain of 6¼ tons of hay, at the outside, to the production of which Mr. Telfer has expended

1 ton guano—say	£11
8 cwt. of the share per acre and oilcake consumed, at 10s.	4
	£15

And if hay is valued at 4*l.* per ton, he has made a profit of 11*l.*, a very considerable sum, but not involving the question of 50 instead of five sheep. I have no doubt that Mr. Telfer and Mr. Kennedy have weighed and measured fairly what they undertook; but suspect that the small sample taken was the best. It is, however, to enlightened and spirited improvers—such as they are—that we look to corrections of my figures, and, at the same time, truth brought out in the mode which I have humbly suggested. I think it proved that cattle may be kept continually in the house, summer and winter, without suffering in health or in the production of milk and meat, and that straw as litter can be wholly dispensed with. This latter appears to me to be a matter of the greatest importance. The common farmer will ask you how he is to make the manure heap without straw. His only notion is putting as much straw as possible, to be trod under foot, and rotted in the fold; but if we turn to Liebig or Johnston, they tell us that the whole of what passes through the animal returns to the earth. The residue of proteine compound that is retained in the animal is scarcely worth recording. According to the Logan experiments, the increase in quantity as respects our winter house-feeding was 6 stones, allowing for larger animals 8 st. of flesh and fat—say 7½ st. of flesh = 33.7 lbs. dry beef, containing 6.4 lbs. of nitrogen and ashes = 90.6 green Rye-grass, or 25 lbs. of oil-cake. What is valuable in the rest, returns into the manure-heap, and thus is made to do a double duty, ministering to life in the animal, while it becomes more available to the plant as manure. If this view be correct, what a waste of food there is under the box and fold-yard systems. Now, as to what is not proved. I find no experiment from which we may conclude that there is an advantage in this house-feeding as to the manure supplied. I have little doubt that there is a great gain, but can find out no instance where the comparison has been made between the results of cattle-feeding on the Grass, and distributing their manure in a fresh and caustic state, and cattle fed on cut Grass, and their manure carefully fermented and applied to the soil just in the condition and at the time when it is wanted. We greatly want experiments to prove that the liquid-manure system is self-sustaining. It is not proved that the best mode of distribution has been attained, or that great economy might not result from the adoption of more iron pipes and hydrants, and less gutta-percha. It is not proved that dark closed-up tanks have any advantage over open ones."

Lord Talbot asked, if Mr. Kennedy used iron pipes. Mr. Hamilton said, he used two-inch iron pipes, which would cost, at present, 19*d.* to 20*d.* a yard. Mr. Ball had been led to believe that the cost of establishing a liquid-manure system would be three or four times the sum stated by Mr. Hamilton—viz., 2*l.* per acre. Mr. Hamilton said, that Mr. Kennedy expended 300*l.* on his tank; but 2-inch pipes cost only 2*l.* per Scotch acre. Mr. Andrews said—Lord Erne might erect very expensive tanks, pipes, and engines, and all the means necessary for the distribution of liquid manure; but where was he to procure it? He consulted Dr. Hodges, of the Chemical Society of Belfast, and him (Mr. Andrews), and they informed his lordship, that from the best consideration which they were able to give to the subject, they considered it to be a very doubtful thing to expend so much money in preparations of the kind before he knew where he could obtain the supply. The result justified that observation. It was not long since a letter was read from Lord Erne, at a meeting in Belfast, inquiring how he was to obtain a supply of liquid manure to pass through those pipes which he had arranged for the purpose. The question was, whether dissolved bones or guano could be made available. He (Mr. Andrews) did not know how the point was settled; but every man appeared to think that, situated as Lord Erne was, it would have been more prudent that he should have compounded the whole of his manure, liquid and solid, and have applied it in a manner that would not only have been advantageous to himself, but he would, at the same time, have been setting an example to his tenantry, and those around, to act in a similar manner. He believed that if a pit be formed, and the whole compressed in a proper way, so as to prevent unnecessary fermentation, with the addition of some dry matter—peat mould, if it could be procured, or, if not, the ordinary application of straw—the whole manure would be absorbed; and if the pit be made water-tight, which was a matter of no great difficulty, it would be in no way a difficult task to apply the manure without the expensive means of pipes and steam-engines. He was the more strengthened in that opinion by the fact, that liquid manure alone, or solid manure alone, was not sufficient; but when both were united they were a proper manure, containing the phosphoric and ammoniacal elements; and if they were compressed into the smallest possible compass, without undue fermentation, everything desirable was obtained. The Irish farmer could not adopt the system of pipes and steam-engines, but he could adopt the plan which he (Mr. Andrews) suggested; and in doing that he did all that was necessary. But when such projects as that of pipes were laid before the farmer, he was led to think that all was nonsense and humbug, and would not listen to the things afterwards which might be of advantage to him. Liquid manure was a very good thing; and if he (Mr. Andrews) could be furnished with such a stream as issued from Edinburgh or Marylebone, he might then get up pipes and steam-engines; but first let him catch the hare, and then he would contrive to cook it. (Laughter.) He had no necessity for anything of the kind until a supply could first be insured. —Dr. Kirkpatrick, in reply to a question from the Chairman, said: I regret that, owing to the advanced period of the season at which the erection of the steam-engine and machinery at the Glasnevin farm was completed, the experiments tried on the application of liquid manure and their results are by no means so satisfactory as I could desire. I, however, confidently look forward to being able to lay before the public interesting and reliable information on this very important subject, as arrangements are being made that will enable us to carry out a series of experiments which will be conducted with as much accuracy as possible, and the results recorded carefully and truthfully. I think the statement which I am now about to submit to your lordships and the meeting will show that the application of liquid manure has been, under the peculiar circumstances of the case, highly successful. You will perceive from this return that on that portion of the field where the liquid was applied, that there is a gross produce of about 38 tons of Italian Rye-grass per statute acre, whilst on the remaining part of the field, which was not irrigated, the produce has been remarkably small—barely four tons per statute acre. It is almost unnecessary for me to remark that the past season was very favourable for the production of Grass, but in addition to this circumstance, I may state that the field on which the experiments were made, is not in a perfectly fertile state, which I attribute chiefly to its having been, some eight or ten years ago, imperfectly drained, and a large portion of the subsoil brought to the surface by trenching. When the Commissioners of National Education, with the view of rendering the course of instruction in practical agriculture as extensive and complete as possible, decided upon having a small steam-engine in addition to the ordinary farm machinery, it was considered advisable to annex the usual apparatus for distributing, by means of steam-power, the large quantity of liquid manure, not merely from the urine of the live stock, but also from the flushings of the privies, contents of the night vessels in the dormitories, and water and soap from the lavatories, and which could not be absorbed by the manure heap, and to cart it over the farm would have been an arduous, if not an impracticable undertaking. Iron pipes, with the usual hydrants, have been laid throughout about 50 statute acres, and it is intended to test the real value of the liquid manure irrigation on this small portion of the farm, and which, if proved to produce satisfactory and remunerative results, as it promises to do, can be extended.

PRODUCE PER STATUTE ACRE OF ITALIAN RYE-GRASS, GROWN WITH AND WITHOUT LIQUID MANURE.

Cutting.	Produce of part to which liquid manure was regularly applied.				Produce of part of same field to which no liquid was applied.

Mr. Ball said that so far as his own views went, he thought the practical observations made by Mr. Andrews were the proper view of the system, not looking lightly on the case as it had been brought under their notice by Mr. Hamilton, for he believed it would be advantageous to use liquid manure where a very large amount of it could be obtained, that there the system of engines and pipes would be advantageous. But they should hold fast by the system which Mr. Andrews had propounded for the guidance of the farmers of this country, and not frighten them by advising a system in their case necessarily beyond their means; but rather induce them, if possible, to use to the best advantage the manure which came in their way; if this be done, a great amount of good would be achieved. Mr. Ball then proposed that the remarks of Mr. Andrews be considered as generally applicable to the circumstances of the country; and also to express a strong feeling, which the meeting entertained, of the valuable suggestions made by Mr. Hamilton in the paper which brought the subject under their consideration.

Lord Talbot seconded this proposition, remarking that the very best thanks of the meeting were due to Mr. Hamilton for the able paper which he had read.

MANCHESTER.—At a late meeting of the Corporation and Town Council, the town-clerk read the following letter from Mr. Samuel Brooks, which was received with the most hearty applause:—

"Manchester, 8th Nov., 1854.

"To the Worshipful the Mayor, Aldermen, and Councillors of the City of Manchester.

"Gentlemen,—I am desirous of calling your attention to a subject which has long been spoken of both in public and in private, but which has not yet been fairly grappled with. I allude to the ultimate disposition of night-soil and sewage, the fertilising properties of which, to the extent of at least 100,000*l.* yearly, are now not only lost to us, but also pollute our streams. Our rivers should be maintained pure, and manure in all its varied forms should be preserved for its true and legitimate use, viz., food for vegetable existence. The mode of dealing with so vast a bulk will require a considerable outlay; but if, as I believe, it can be shown to be remunerative, capital will naturally be attracted to the enterprise. Your co-operation will be necessary to the success of any plan; and that you may obtain the best plan, I shall be glad to place at your disposal the sum of 1000*l.*, to be expended in preliminary inquiries, premiums for plans, and experiments as to the value of the night-soil. In inviting your aid for this purpose it should be understood distinctly that you should not be committed to any merely speculative expenditure of public money, but solely to the exercise of such powers as are vested in you for the public good, as may be required by the circumstances, and which it is impossible for any individual or association, without Parliamentary sanction, to bring into active and useful employment. If you will accept the trust, I beg respectfully to suggest that the committee of inquiry appointed by yourselves should secure the services of Mr. Fairbairn and Mr. Bateman for the engineering department, and Mr. Crace Calvert and Dr. Angus Smith for the chemical department. — I am, yours respectfully,

SAM. BROOKS."

Mr. Alderman Pilling said that when any gentleman would put down 1000*l.* for the promotion of a public object, in which he was not specially interested, his conduct must be at once admitted to be most liberal and encouraging. But he would suggest that it would be better that they should first consider whether they should accept the money with the responsibilities, or whether a committee should not inquire and report upon the subject. If they accepted the money upon the conditions stated, they would be bound to observe those conditions and to enter upon the investigation; but nothing would be lost by waiting a few days, or until the council next met, so that the committee might inquire and report more particularly upon the conditions to be attached to the gift of the 1000*l.* He should be very sorry indeed if it could be imagined that he wished to throw any obstacles in the way; his feeling was quite the reverse. He should be proud to be connected with those who could succeed in such an undertaking; and while he was satisfied that the completion of such a thing would be a great credit and an advantage to the city, he was sure that before anything was done, all the talent that could be found would be brought together.—The town-clerk said he had prepared a resolution which quite met Mr. Alderman Pilling's views. It was—"That the thanks of this council be tendered to Mr. Samuel Brooks for his communication, and for the liberal proposal therein made, to place at the disposal of the council, for public purposes, the sum of 1000*l.* That the letter be referred to the committee for general purposes, with instructions to consider and report thereon."

Mr. Alderman Pilling moved the resolution with the greatest pleasure—Mr. Joseph Adshead seconded it. There were conditions annexed to the offer that would require the greatest consideration; for Mr. Brooks's letter nominated the engineers and chemists for the examination of the soils, &c. He thought it would have been as well if Mr. Brooks had omitted those stipulations, leaving it to the council to obtain the very best professional advice they possibly could. No one would question the high position of Mr. Fairbairn, and the very circumstance of the corporation employing Mr. Bateman to construct their water works, seemed to sanction the view taken by Mr. Brooks as to him. But he (Mr. Adshead) must venture to think that, high as those gentlemen were as authorities, Mr. Brooks's letter did appear to limit the committee that might be appointed, in obtaining other advice and counsel. Professor Calvert was a good authority; but there might be gentlemen who understood the particular chemical combinations of night-soils, &c., better than even that gentleman did. If 1000*l.* was to be presented for a preliminary inquiry, let the question be an entirely open one, so that a committee might obtain the very best advice possible.—Mr. Alderman Neild said there was a saying that "A gift was a precious thing in the eyes of him that hath it; for whichever way he turneth it he turneth it to profit." But Mr. Adshead did not seem able to turn this munificent gift to profit, by any means. Could any man name higher authorities than those named by Mr. Brooks. He did not suppose that Mr. Brooks cared much upon the point; but he suggested certain names which he (Mr. Alderman Neild) considered very excellent. He must say, as a farmer—and perhaps there were not many gentlemen in the council chamber who would come within that category—that it was a most valuable donation. He knew that the amount of absurd nonsense that had been talked on this subject of sewage, &c., manure, almost passed belief; and he unfeignedly rejoiced at the prospect of the matter being put prominently before the public in something like a practical shape. He scarcely conceived it possible, so far as the interests of this community were concerned, that the council could discuss a more important question. Mr. Brooks expressly offered his most munificent donation, in order that the thing might be experimentally tested, without the expenditure of public money; and thus they were enabled to get over a very considerable difficulty. He hoped that beneficial results would come out of the offer; if they did not, it was certainly not the fault of Mr. Brooks.

* This is nearly double the usual allowance of 12 to 13 lbs. per hour per horse power, which would give about 9 cwt. for working 12 hours. I merely give the manager's statements to me, and much depends upon the construction of the steam-engine; but in either case we must see that nothing but the absence of water-power, and the extent of the duty to be done, can justify the application of steam as a driving power. I am inclined to think that all the secondary uses made of the boiler of a steam-engine are injudicious, as a small separate boiler—such as Stanley's—does minor work at a very trifling expenditure of fuel.

† In July last the price of hay was quoted at 11*d.* to 13*d.* per stone of 24 lbs. At this price, soil should have been worth about 25*s.* per ton, allowing for the expense of hay-making; in Dublin, same date, hay was 4*l.* 1s., and soil about 25*s.*, so that the cow-keepers who pay 40*l.* for their acre of meadow, would, at 50 tons, get a gross produce 62*l.* 10*s.*; probably much more than the difference paid between the value of standing meadows and soil or hay

Miscellaneous.

Guano, Nitrate of Soda, and Common Salt on Wheat.—I take the opportunity while writing to you of sending the result of some experiments made by me this season at Baldoon, on the application of manure to Wheat, and in continuation of similar ones made last year. In the centre of a 50-acre field one acre was left without manure, all the rest of the field receiving 2 cwt. of Peruvian guano per acre in autumn, at the time the seed was sown. The produce of the acre undressed has been tested against that of the adjoining acre, which received Peruvian guano, and this is the result :—

One acre, with guano, 32 bushels, 63 lbs. weight per bushel, at 6*s.* 6*d.* per 60 lbs.	£10	18	4
One acre, without manure, 25½ bushels, 60 lbs. weight per bushel, at 6*s.* 6*d.* per 60 lbs....	8	5	9
	£2	12	7
Cost of 2 cwt. of guano in 1853	1	0	0
Profit per acre, beside one-fourth more straw ...	£1	12	7

The inferiority in the quality of the unmanured Wheat, as shown by the weight per bushel, is worthy of notice, as well as the fact that the unmanured Wheat was a week later in ripening than the other. The second experiment was made to test the value of nitrate of soda and common salt as a top dressing to Wheat in spring, and the result in this case has been extremely profitable. The Wheat was sown in December after a heavy crop of Swedes, all drawn off ; and the whole field was top-dressed in April with 1 cwt. of nitrate of soda and 1 cwt. of salt per acre, given in two applications at a fortnight's interval, one acre near the centre of the field having been left undressed. This and the adjoining acre have been threshed, and yielded as follows :—

One acre, with nitrate and salt, 42 bushels, worth 6*s.* 6*d.*	£13	13	0
One acre, without manure, 30 bushels, worth 6*s.* 6*d.* ...	9	15	0
	£3	18	0
Cost of manure, 1 cwt. nitrate, 18*s.*, 1 cwt. of salt 2*s.* ...	1	0	0
Profit per acre...	£2	18	0

These two experiments supply little that is new, as they only corroborate hundreds of others made in various parts of the country in previous years. But they are useful in impressing upon the British grower the power he might possess of increasing the produce of his Wheat crops. It is not merely a question of profit to the farmer. Here are two substances, the application of which in certain known quantities to the soil give an increase which may be stated, on the average, at one quarter of Wheat per acre, or an addition of nearly one-fourth to its natural produce. An addition of one quarter per acre all over the country would be equivalent to the food of one-fourth of our population. It would make all the difference between plenty and scarcity, between the cheap loaf and the dear loaf, between steady prosperity and a drain of gold, with all its commercial disturbances. And yet the arrangements for the supply of articles known to possess such qualities, instead of being a prime object of care to the British Government, are intrusted to the charge of some uninfluential consul at the antipodes. *James Caird*, 9, *Little Ryder Street, St. James's ; in the Times.*

The Horse Power Machine.—The next machine in sequence of farm operations would be the threshing machine, of which several were exhibited, but as all these require power to put them operation, it will be best to describe the horse powers made use of first. Of these there are two, based upon very different mechanical principles : the one known as the "sweep, or lever-horse power," similar to that commonly used in this country ; and the other, peculiar to North America, is called,—the "rotary," or "railroad horse power," in which motion is given to an endless chain directly, by the weight and muscular power of the animal pressing on it. Of the former, there were several exhibited, two of which, however, presented points which appear to be worthy of notice, as tending to lessen the great loss sustained in "bringing up the speed" in the ordinary "horse power." These two were somewhat similar in construction, the difference between them being that the one (Taplin's) communicated its power by means of a cogged wheel of large diameter working directly into another or driving-wheel of smaller diameter, while the other (Palmer's) substituted a band for the large wheel, and thus drove the smaller wheel, over which it passed. The "railroad," or endless-chain power, is used far and wide throughout the Union, and for all purposes where power is needed. It may be seen daily in operation, driving threshing machines, circular saws, cotton-gins, elevators at the granaries and stores, ferry-boats, pile-driving, grinding, churning, &c., for all of which purposes it is well adapted, owing to the direct and immediate manner in which it communicates motion, and to its general compactness, cheapness, and facility of being moved about. These are made by almost every agricultural machine maker in the States, and as they vary but slightly in details of construction, and many have high local reputations, I have selected Emery's for description, the first premium having been adjudged to it by the New York State Agricultural Society, at the trial of implements held at Geneva in the autumn of 1852. *Professor Wilson's Report on the New York Exhibition*, p. 106. [Following this are drawings of the endless chain horse power in question, which we regret we cannot give ; the above notice will be understood better in connection with that on the same subject by Mr. Thomas, given in another column.]

Calendar of Operations.

NOVEMBER.

"November aye full is of misty days,
Or clouded skies, and storms, and miry ways."

BORDER OF THE FENS, *Nov.* 20.—Much welcome rain fell last week—welcome to those who dwell in towns as well as country, for there is a positive scarcity of water; everywhere complaints abound of wells being dry, so that sweet spring water is with many indeed a luxury. In some towns water cannot be procured to work maltings and breweries, streams do not contain enough for the millers, and all kinds of shifts and contrivances have barely sufficed for a supply of this most necessary element for horses and horned stock ; in some cases, the want of water has delayed the sheltering of cattle in the yards, when their drink has to be carted a long distance. As we approach the dark days of Christmas, it becomes daily more apparent that the food for stock will this year be an expensive affair. Hay, 5*l.* a ton and upwards; Linseed cake, 13*l.* 10*s.*; grinding Barley, 34*s.* to 36*s.* per quarter; Oats, 30*s.* to 32*s.*; Pulse, 44*s.* to 46*s.*; Turnips and Mangolds scarcely anywhere an average yield; and no "rough Grass" in the pastures for the hardy "Scots." It is true that straw is plentiful, of excellent quality, deserves to be taken great care of, and will be a real treasure if we should have a prolonged or severe winter. Rape-cake at 6*l.* a ton, and a full crop of Carrots, will help to keep young horses and cows in condition; but the pigs will miss diseased Potatoes, and new schemes should be devised to economise all feeding materials, since we must manufacture sufficient manure, and keep the stock thriving. The "Wheat seeding" progresses favourably, rain being as beneficial to that process as it is to many other accounts. We say plough dry, and sow wet; but much of the seed has gone in dry and laid dry until the last few days. If the October sown can be got in with a moist bed, there is a better chance of the plant becoming strong enough to survive the casualties of winter; but it will be admitted that this year November sown may be expected to succeed as well as that put in earlier. Now, as the only impediment to having the land ploughed soon enough this autumn has been the excessive hardness of the soil, we may presume that there are several instances where the land was ploughed early and yet seeded late, it may not be an inappropriate question to ask whether five or six weeks intermediate is too long a time to elapse, or whether a field sown directly after being ploughed gives better promise of a full crop than one that has lain a considerable time undisturbed? The old Red Lammas Wheat has always in this neighbourhood, a large circle of patrons ; next we find a partiality for the "siah" or "sire." The "giant" is a coarse-growing sort, but productive. The Rivet is sold to millers with difficulty, and therefore will not be much used this year. "Bristol Red" yields remarkably well, but is not a favourite Wheat to grind. "White chaff" has many admirers. White Wheat is not sown much ; samples of Taunton Dean are most frequent. Talavera is seldom seen. The purchase of seed Wheat being nearly over, we may expect less eagerness to try, and as the prices have gone far beyond any one's expectations, the probability is that to some extent they may recede until winter sets fairly in. Last Saturday good 18-stone Wheat was currently sold here at 74*s.* per quarter. Labourers are fully employed; ordinary men at 13*s.* per week. *J. W., Peterborough.*

SOUTH DEVON, *Nov.* 20.—The weather during the last month having been exceedingly favourable for tillage purposes, a large breadth of Wheat land has already been sown in good condition, especially in the heavy lands, and the work still goes on briskly. We may also add that the young plant looks generally healthy and vigorous. The Turnips in the land intended for Wheat are being consumed by sheep, and the Mangold crop lifted from the ground and stored in canes, either against a dry hedge bank or wall; they are then covered with straw and thatched over with a little reed. Some store them similar to Potatoes, and cover them over with earth, but on the whole the former plan will be found the quickest, straw being generally abundant at this season of the year. The Mangold crop is not a good one, in short all green crops are very partial, none up to the mark, and in many places a decided failure. We are now busy breaking Apples for cider; this is also a very partial and deficient crop, but we have a large supply of foreign fruit which has been the means of keeping down the price to between 30*s.* and 32*s.* 6*d.* per hogshead. The cost of converting the fruit into cider is calculated to be about 4*s.* per hogshead; this includes fetching the Apples and drawing the cider to the cellar, when of course it passes into the hands of the cellarman to be dealt with as required. Our last year's corn crops appear to give satisfaction, so far as the yield is concerned, and are realising good prices. Wheat may be quoted at from 76*s.* to 80*s.*; Barley from 32*s.* to 35*s.*; and Oats from 28*s.* to 30*s.* per quarter. Meat still continues high, both beef and mutton fetching from 6½*d.* to 7*d.* per lb.

Notices to Correspondents.

BONES FOR GRASS LAND : *South Court.* We would recommend 3 cwt. per acre of the superphosphate rather than a large dressing of bones unprepared, except by crushing. Bone-dust is a very efficient manure. You can apply it in the state of superphosphate early in spring. It is cheaper and more efficient to use the superphosphate.

BONES ON GRASS : *G B.* What do you mean by "prepared" bones? If you mean the superphosphate of lime, apply in spring or early in February. If you mean merely reduced by crushing, or fermentation, or grinding, apply broadcast.

CHESHIRE BONING : *Theta.* The remark as to the wastefulness of the process referred especially to the large quantities, half reduced, which are applied at once. Three or four quarters of bone-dust will yield annually so much soluble matter. Better purchase and apply annually that quantity of soluble superphosphate yourself than invest a large sum in a great quantity of material from which rain-rater can dissolve the necessary supply per annum. The wastefulness is in the investment of a large sum of money at once, even though it is not to be repeated for 20 years.

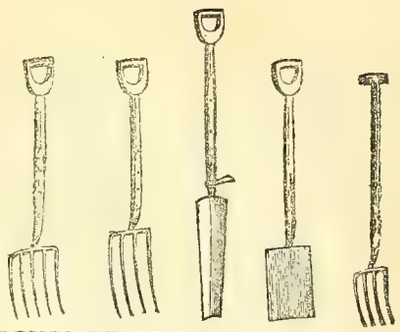
GRASS LAND : *A B.* If you cannot get 3 cwt. of guano per acre to mix with a cart-load of loam, and spread by shovel out of the cart per acre, then you can spread, in early spring, 3 cwt. of superphosphate of lime, and afterwards 20 bushels of soot mixed with 3 cwt. of salt.

LIME : *J W R.* It can no doubt be burned with peat. Perhaps some correspondent will state his experience. In a compost of peat and lime there is no harm in an excess of the former, and peat mould from under that ling is probably as good as that from under long-growing ling. We do not know the relative value of leaves as manure, but should not prefer those of the resinous Pine tribe; Oak, Alder, Hazel, &c., would be better. The quantity of lime applied per acre may be increased, according to the coarseness of the herbage on which it is to be applied.

THE "PROPERTIES OF QUICK LIME:" *A Farmer.* They are the subject of a volume rather than of a paragraph. It will neutralise mischievous acid substances in the soil—it will displace, and so fit for use, portions of the soil now fixed and useless—it will so act upon vegetable matters in the soil as to make them capable of contributing to the growth of new vegetable structures—and it is itself directly to some extent the food of plants.

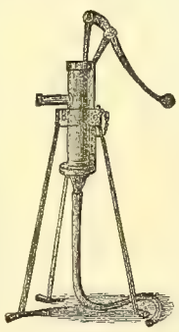
ERRATUM. In the table of weeds and their produce, published in the leading article last week, Centaurea jacobea should have been C. scabiosa; and the produce of Chrysanthemum leucanthemum is 13,500 seeds per plant. Below this table, for—"In my own immediate neighbourhood," read "in our own," &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.



The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ *s.* *d.*
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1 12 0
2½ „	long 3 „ 3 „	gutta percha,	1 15 9
3 „	ditto 3 „ 6 „	or cast iron	2 12 0
3½ „	ditto 3 „ 6 „	flanged pipe,	2 18 0
4 „	ditto 3 „ 6 „	as required.	3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2½ in. long	ditto ditto ditto		2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

THE LINCOLN SHOW.

FIRST PRIZE.

ROOT PULPING MACHINE.—Invented and Patented by FREDERICK PHILLIPS, of the Hall Farm, near Brandon, Suffolk. The object of these Machines is to introduce a more profitable Mode of Feeding Fattening Animals, by giving them Roots and dry food mixed together, instead of the old system of feeding them at one meal with cold sloppy roots, and at another with compact farinaceous or oleaginous food. Their peculiar advantage is that they so effectually pulp or mince down Turnips or other Roots that animals cannot pick them out from any dry meal or chaff they may be mixed with. Animals by this mode improve faster, and at less expense, than by the old system of feeding. It is also an economical method of keeping lean stock, whether the Flock, the Herd, or Horses, as they may be made to eat with a relish Straw, Chaff, or indifferent Hay Chaff, by mixing a portion of minced Roots with them. These Machines have been greatly simplified, improved, and reduced in price, by the Patentee, since they were exhibited at the Lincoln Show. They will be Exhibited at the coming Cattle Show of the Smithfield Club—Stand 236.

THE PATENT SPRING SHAFT CART AND SAFETY CAR.—This vehicle is admirably adapted for the use of country gentlemen, farmers, emigrants, and sportsmen, for whose purposes it will be found superior to any yet introduced, being simple in structure, easy of draught, roomy, light, and safe.
As a family car or chaise cart to convey persons, luggage, &c., or as a sporting or dog cart, its advantages consist in the great number and weight it will carry, its safety in a hilly country, its ease of draught, and the facility it affords, to ladies especially, for getting in and out.
As a Tradesman's, Colonial, Emigrant's, or Farmer's Cart, it is well adapted for the carriage of Implements, Stock (such as calves or lambs), and goods of all kinds.
The peculiarity of the Spring enables it to be applied, without expense, to any ordinary Farm-cart. Specimens of each description may be seen at the Maker's, T. B. AYSHFORD, 56, Drury Lane, London; and will be exhibited at the Smithfield Club Agricultural Show in Baker Street, by Mr. WILLIAM PIERCE, Agricultural Engineer, 73, Mark Lane, City, from whom all information and full particulars may be obtained.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

6 in. by 4 in. to 6 in. by 5½ in. ...	13*s.* 3*d.*	per 100 feet.
7 by 5 to 8 by 6	13 6	
8¼ by 6¼ to 10 by 8	14 0	
10½ by 8½ to 14½ by 10½ ...	16 0	
17 by 10 to 18 by 12	18 0	

A great variety of sizes. Particulars had on application.

ORCHARD HOUSE SQUARES on Mr. RIVERS's plan, to whom I have sold some thousands of feet.

Large Sheets for cutting up, in cases, at 2½*d.* and 3*d.* per foot.

HARTLEY'S IMPROVED ROUGH PLATE GLASS, Sheet, and Rough Plate, Tiles, Milk Pans, Bee and Propagating Glasses, Wasp Traps, Cucumber Tubes, Preserve Jars, with and without covers; Fern Glasses.

Plate, Sheet, Crown, and Ornamental Window Glass. Crystal Glass Shades for ornaments.

Greenhouses, erected in either wood or iron. Garden Lights and Frames.

87, Bishopsgate Street Without, London—same side as Eastern Counties Railway.

BOYDELL'S PATENT HAND-GLASSES.

Size 15 by 12 by 18½ inches high.

With 16 oz. Glass	9*s.* 0*d.* each.
„ 21 oz. „	10 0 „
„ 26 oz. „	11 0 „

N.B.—The advantages of these Hand-Glasses are—

1st. *Saving in Packing and Carriage*, being so contrived as to be readily taken to pieces and packed in a small compass.

2d. *Glazing without Putty or Glazier*—the Glass being fixed in grooves in the iron frame.

3d. *Facility for Ventilation*—the two top panes being made to slide up and down at pleasure.

4th. *Durability and Solidity of the Frames*—which are made of wrought iron.

JAMES PHILLIPS & Co., Agents for above, 116, Bishopsgate Street Without, London.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, 296, Oxford Street, London.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

ALFRED KENT'S PATENT WEATHER-PROOF GLAZING WITHOUT PUTTY.—For Horticultural Buildings in Wood or Metal.

HORTICULTURAL BUILDING WORKS, CHICHESTER.

Illustrated Books describing inventions, containing prices and particulars relating to the different designs, sent on receipt of four postage stamps. Nurserymen and others appointed agents on application.

Horticultural Buildings upon this plan having been erected in many different parts of the country, and having stood the trial of all weathers, and more especially the severest of all, viz., frost, A. KENT, with full confidence, strengthened by the many flattering testimonials he has received, can safely guarantee the proper working of his Patent System of Glazing. Estimates and Plans sent, including Heating by Hot Water.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1*l.*—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch „ strong „ ...	9 „	6¼ „
2-inch „ extra strong „ ...	12 „	9 „
1⅝-inch „ light „ ...	8 „	6 „
1⅝-inch „ strong „ ...	10 „	8 „
1⅝-inch „ extra strong „ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work. Asphalte Roofing Felt, &c.

FOR IRON CONSERVATORY STEAM PIPES, FENCES, ETC.

WILSHERE'S BLACK VARNISH is the best article that can be used, giving a rich black gloss. Goes twice as far as paint; 4*s.* per gallon.

2, Talbot Court, Gracechurch Street, London. Agent, St. David Street, Edinburgh.

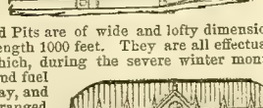
HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

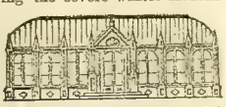
HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentlemen can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

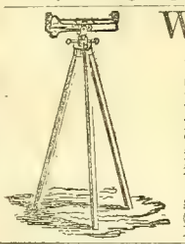


Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.



Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.



WEIR'S DRAINING LEVEL
PRICE 30*s.*

These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 66 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

'FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

VISITORS TO THE SMITHFIELD CATTLE SHOW are invited to inspect BREIDENBACH'S PERFUMERY WAREHOUSE, 157 B, New Bond Street, where will be found a choice collection of elegant Presents, Christmas, and New Year's Gifts. The GUINEA CASE of PERFUMERY contains every requisite for a lady's or gentleman's toilet, including two bottles of choice perfume for the handkerchief, a glass jar of prepared cream for the hair, a sachet of ground dried flowers, a bottle of smelling salts, or Vinaigrette, a china pot of lip-salve, a jar of rose cold cream, a box of Odonto tooth powder, and a bottle of rose-scented Eau de Cologne. Also a neat case fitted in the same way, 10*s.* 6*d.* each. Real Eau de Cologne, 10*s.* case of six bottles, or 2*s.* singly.

157 B, New Bond Street, London.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

FORD'S EUREKA COLOURED SHIRTING is now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.

FORD'S COLOURED EUREKA SHIRTS, Six for 27*s.*

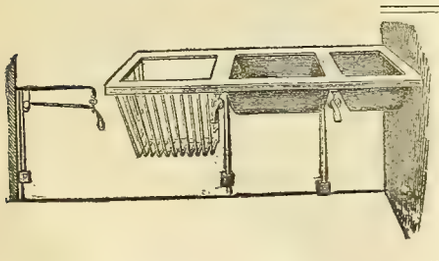
FORD'S WHITE EUREKAS, best quality, Six for 40*s.*; second quality, Six for 31*s.*; if washed ready for use, 2*s.* extra.

CAUTION.—Ford's Eureka Shirts are stamped, "38, POULTRY, LONDON," without which none are genuine.

*** Catalogues with particulars post free.

RICHARD FORD, 38, Poultry, London.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.



COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, as one Fixture, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest.

COTTAM'S ENAMELLED MANGERS

are constructed in the best possible manner; both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.

IMPROVED PUMPS,

OF THE BEST WORKMANSHIP AND WARRANTED.

The VALVES and SUCKERS of these Pumps are constructed upon an entirely new and SIMPLE principle; they are not likely to get out of order; should they do so, can easily be repaired, as the Pump is so contrived that the valves can readily be got at.

An Improved CAST IRON TRAP, strongly recommended by the Sanitary Commissioners, and suitable for Sugar Bakers, Slaughter Houses, &c. &c. It is so formed that the Trap-plate will pass any matter the top grating will let through, and therefore is not liable to stoppages; and well adapted to Stables and Stable-yards, for saving the best part of Liquid Manure.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

DERBY BURIAL BOARD.

TENDERS FOR TREES AND PLANTING.

WANTED, by the Derby Burial Board, TENDERS for PROVIDING and PLANTING TREES in the NEW CEMETERY adjoining the Nottingham Road, Derby. The plan and specification may be seen at the Clerk's Office, 14, Full Street, Derby, after Thursday, the 30th inst. Sealed Tenders addressed to "The Chairman of the Derby Burial Board," marked "Tender for Planting, &c.," must be delivered at the Clerk's Office, not later than 12 o'clock at noon, on Thursday, December 14. JOHN WALKER,
November 21. Clerk to the Board.

TO BE SOLD, a few short-legged PARTRIDGE-COLOURED COCHINS, from Mr. Punchard's Stock, at 12s. the pair; also some COCKERELLS, from a "Sturgeon" Hen by a Buff "Andrews" Cock, at 9s. each; the above are good birds, six months old. Also two pairs of SILVER-SPANGLED HAMBURGHS, from Prize Stock, at 10s.—Address R. O., 7, Raeburn Place, Edinburgh.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, Dec. 1, at 12 o'clock, a first-class collection of DUTCH BULBS, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Anemones, Crocus, Snowdrops, Tulips, &c.; also a selected assortment of Standard and Dwarf Roses, Ornamental Trees, and American Plants well set with bloom buds, &c. On view the morning of Sale.—Catalogues had at the Mart; and of the Auctioners, American Nursery, Leytonstone, Essex.

CHOICE COLLECTION OF DUTCH BULBS, STANDARD ROSES, ETC., ETC.

MR. ALEXANDER will Sell by Auction, at the Mart, near the Bank of England, on THURSDAY, November 30th, at 12 o'clock, a choice collection of DUTCH BULBS, comprising Hyacinths, Crocus, Narcissus, Anemones, Ranunculus, Tulips, &c.; also choice Standard, Dwarf, and Climbing Roses, Azaleas, Camellias, and other plants.—May be viewed on the morning of sale, and Catalogues had.

RANELAGH.

TO GENTLEMEN PLANTING, NURSERYMEN, AND OTHERS.

MR. GEO. HAINES has been instructed to sell by Auction, on the grounds (to be cleared for building purposes), near Chelsea Hospital, on TUESDAY, November 28, at 12 o'clock, large Elm, Poplar, and other Timber Trees; Cedar of Lebanon, young Lime Fruit, and other Trees; Shrubs, Evergreens, Roses, Iron Hurdles, Wood Fencing, Brick Walls, Forcing Pits, Burrs, and Effects. May be viewed. Catalogues to be had on the premises; of Mr. Tuck, Nurseryman, Sloane Street; and at Mr. HAINES' Offices, Grosvenor Street West, Eaton Square, and 12, High Street, Kensington.

COLESHILL, BERKS.

MESSRS. FIDEL AND DYKE are honoured with instructions to announce that the annual SALE of STOCK of the Right Honourable the Earl of Radnor is fixed for MONDAY, the 4th December, 1854, (the day before Farringdon Great Market). The Sale will include 34 FAT HEREFORD SHORT-HORNED and DEVON COWS, HEIFERS, and STEERS; 250 SUPERIOR FAT SOUTH-DOWN SHEEP, and 8 FAT PIGS; also 4 FIRST-CLASS HEREFORD and SHORT-HORNED BULLS; 2 VALUABLE CART-HORSES, and about 40 sacks of POTATOES.—Sale to commence punctually at Two o'clock. Catalogues (with Pedigrees of the Bulls) may be had of the Auctioneers, Farringdon, Berks. Coleshill is about four miles from the Shrivenham Station, on the Great Western Railway.

IT IS THE PECULIAR CHARACTERISTIC OF PARR'S LIFE PILLS that they purify the system mildly and imperceptibly, so that there is no reaction or tendency to constipation afterwards, as is the case with the purgatives administered by many apothecaries. There are instances of persons with diseased livers and tender lungs who have passed years of misery, pain, and apprehension, but who, after taking PARR'S LIFE PILLS, have actually been made whole, the liver having resumed its proper functions. For Bilious Disorders, Liver Complaints, Indigestion, Costiveness, Sick Headache, Depression of Spirits, Pains in the Back, Gravel, and Lumbago, PARR'S LIFE PILLS will be found a safe and admirable remedy. Invalids should make an immediate trial of this excellent, long-tried, and successful medicine.

Sold by E. Edwards, 67, St. Paul's Churchyard; Barclay and Sons, Farringdon Street; Sutton and Co., Bow Churchyard; Hannay and Co., 63, and Sanger, 150, Oxford Street, London; and by all respectable chemists and medicine vendors in town or country.—In boxes, price 1s. 1½d., 2s. 9d., and in family packets 11s. each.

*** Be sure to ask for PARR'S LIFE PILLS.

HOLLOWAY'S PILLS INFALLIBLE FOR THE CURE OF FEMALE COMPLAINTS.—Mr. G. E. Taylor, of South Cave, informs Professor HOLLOWAY, in a letter dated Sept. 26, 1854, that—"Mrs. Sarah Cave, of Ellakes, was afflicted for a long time with swellings in the stomach (which occurred at the turn of life), giving strong indications of dropsy, —in fact she had been frequently told that dropsy was her complaint. She was ultimately thrown on a bed of sickness, when she commenced using HOLLOWAY'S Pills; after taking a few doses, she was completely cured, and now enjoys excellent health,—better than ever she felt before."—Sold by all Vendors of Medicine; and at Professor HOLLOWAY'S Establishment, 244, Strand, London, and 80, Maiden Lane, New York.

BLAIR'S GOUT AND RHEUMATIC PILLS Price 1s. 1½d. and 2s. 9d. per box.—Mr. William Courtney, of Barton Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and give a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1s. 1½d. per box.—Observe that "THOMAS PROUT" is on the Government stamp.

JOHN MORREN, GENERAL COMMISSION AGENT, Ock Street, Abingdon, is open for Commissions for the sale of Agricultural Implements, Manures, Seeds, &c., and for the purchase of Corn, &c.

AGRICULTURAL TUITION.—Sons of Gentlemen received as Agricultural Pupils into the family of a Clergyman occupying a Farm, cultivated under the Improved System, 25 miles from London.—Address Rev. C. C., Office of this Paper.

NOTICE.

OVER-COATS, CAPES, &c.—One of the largest stocks in London of every description, first-class garments, at lowest charges; also of Youth's ditto, all made thoroughly impervious to rain, without extra charge, or made to order at a day's notice.—W. BERD 1E, 96, New Bond Street, and 69, Cornhill (only).

TO LOVERS OF FISH.—100 Genuine Yarmouth Bloaters for 6s., package included, forwarded to all parts on receipt of Penny Postage Stamps, or Post Office Order, for the amount preferred.
Address, THOMAS LETTIS, Jun., Fish Curer, Great Yarmouth.

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge.
ESTABLISHED A.D. 1700.

TEN THOUSAND STOVES.

THE TENTH THOUSAND OF THE PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, AND CO., 46, King William Street, London Bridge; and may be obtained of most Ironmongers.

The IMPROVED PATENT VENTILATING STOVE, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded post free.

THE MOST APPROVED STOVES.—The demand for the CHUNK and VESTA STOVES (separately patented), still continuing unabated, and numbers having been sold last season (in all upwards of 14,000) through the patronage of families who have had experience of their pre-eminently useful qualities, WILLIAM S. BURTON has renewed confidence in recommending them for their cleanliness, economy, and safety. During the last 13 years they have been found sources of great comfort in the bedroom of the invalid, affording an uniform temperature throughout the day and night, with one supply of fuel, without attention. Particulars sent postage free. Chunk, 30s. to 50s.; Vesta, from 35s.; Stoves for Warehouses, &c., from 10s. each. Joyce's Patent Fuel, 4s. 6d. per sealed bag.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

39, OXFORD STREET (corner of Newman Street); Nos. 1, & 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads, 18s.; Portable Folding Bedsteads from 12s. 6d.; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21s.; and Cots from 21s. each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2l. 19s. to 13l. 13s.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

	Fiddle Pattern.	Thread or Brunswick Pattern.	King's Pattern.
Tea Spoons, per dozen ...	18s.	26s.	32s.
Dessert Forks ,, ...	30s.	40s.	46s.

Table Spoons and Forks, full size, per doz.	12s.	28s.	30s.
Dessert ditto and ditto	10s.	21s.	25s.
Tea ditto	5s.	11s.	12s.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from all the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are now ON SHOW in one of his TEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz. from 12s. 6d. (two lights) to 16l.

LAMPS OF ALL SORTS AND PATTERNS.—The largest, as well as the choicest, assortment in existence of FRENCH and ENGLISH MODERATEUR, PALMER'S, CAMPHINE, ARGAND, SOLAR, and other LAMPS, with all the latest improvements, and of the newest and most *recherché* patterns, in ormolu, Bohemian, and plain glass, or papier-mâché, is at WILLIAM S. BURTON'S, and they are arranged in one large room, so that patterns, sizes, and sorts can be instantly selected.

Real French Colza Oil, 4s. 9d. per gallon.
Palmer's Candles, 9d., 9½d., and 10d. per lb.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, MOUSTACHES, &c.?—ALICE MELVILLE'S PALMAPILLA in all cases strengthens weak hair, prevents its falling off, checks greyness, produces a thick and luxuriant growth, dispels scurf and dandriff, and makes it clean, soft, curly, and brilliant in appearance. For baldness from any cause it is certain and effective; and for the production of Whiskers, Moustaches, Eyebrows, &c., in three or four weeks, it can be fully depended upon. Price 2s., sent post free (anywhere) on receipt of 24 penny postage stamps, by Miss MELVILLE, 25, Argyle Square, King's Cross, London. —"My whiskers are growing very thick." R. Mede, Esq.—"It restored my hair, which I had lost in patches." W. Sturt.—"It has quite checked the greyness." Miss Ellis.—"My Moustache is greatly improved." Capt. Ross.

ROYAL PANOPTICAN OF SCIENCE AND ART, LEICESTER SQUARE.—Lectures for the ensuing week:—Dr. Noad, on Electricity, with Demonstrations on the Gigantic Electrical Machine in the Rotunda, Monday evening, 8.15. WANTED TO PURCHASE, the GARDENERS' CHRONICLE, No. 36, Sept. 3, 1853.—Apply to JOSEPH CLAYTON & SON, Advertising Agents, 265, Strand, or 223, Piccadilly, London.

BOOSEY'S FOREIGN MUSICAL LIBRARY.—The most extensive Collection of all Classes of Foreign and English Music is to be found at this Library, which resembles rather a Public Institution than a Private Establishment. A Subscriber of Two Guineas has the command of above 100,000 Works, from which he may select two guineas' worth for perusal at one time.—BOOSEY & SONS, 28, Holles Street, London.

AGRICULTURE.—Every Farmer should read the AGRICULTURAL MAGAZINE, it being the only monthly periodical devoted to his interest. It is published at 1s., and can be had by order of any Bookseller, or by sending 12 Stamps to the Publisher, 6, Chenies Street, Bedford Square, London.

A SUPPLEMENT, GRATIS, WITH THE WEEKLY DISPATCH, EVERY WEEK UNTIL FURTHER NOTICE.—The unexampled interest which attaches to every incident connected with the operations of the Allied Armies in the East has determined the Proprietors of the WEEKLY DISPATCH to devote a greater space to the intelligence from the seat of war than the ordinary limits of this, the largest newspaper published, could possibly afford; and, with the view of giving the amplest details, they have resolved upon the issue of a SERIES OF SUPPLEMENTS, GRATIS, which will include every particular of interest connected with the Siege and decision of the contest at Sebastopol, and will be continued whenever demanded by the progress of the Campaign.

By the publication of these Supplements the portion of the Paper usually devoted to incidents of domestic and political importance will be reserved intact, and the engrossing subject of the War will receive the fullest and most varied illustration.

A SUPPLEMENT WILL BE PUBLISHED ON SUNDAY NEXT (GRATIS), and on every succeeding week until further Notice.—Orders may be given to all Newsvendors in town and country; and to the Publisher, at the *Dispatch* Office, 139, Fleet Street, London.

Third Edition, considerably enlarged, price 5s. 6d.

THE BRITISH POMOLOGICAL SOCIETY meets at the rooms, 20, Bedford Street, Covent Garden, London, on the first MONDAY of every month, to receive communications respecting Fruits and Fruit Trees, for the Election of Members, and for General Business.

All communications and packages containing specimens of Fruits, to be addressed to ROBERT HOGG, Secretary.

SMITHFIELD CLUB.—BAKER STREET BAZAAR. STAND 278.
SUTTON AND SONS, READING.

SMITHFIELD CLUB SHOW.

WILLIAM SKIRVING, of Liverpool, begs to acquaint his friends and the public that he will attend, as usual, the ensuing Smithfield Show, on the 5th, 6th, 7th, and 8th of December, to exhibit Roots of his IMPROVED SWEDE TURNIP, and to take orders for the Seed of it, and all other kinds of Agricultural Seeds.—December 2.

SEED GROWERS' SOCIETY.—The Members of the above Society are now prepared to send LISTS of AGRICULTURAL, GARDEN, and FLOWER SEEDS to those who are desirous of having them genuine and direct from the Growers.—Applications addressed to the Secretary, JOHN MOSS, Jun., Faring, Kelvedon, Essex, will meet with prompt attention.

CHRYSANTHEMUMS.

J. AND J. FRASER have now in bloom a very fine collection of the above, comprising the best of Pompone and large flowering varieties. Fine strong plants in bloom, from 9*s*. to 12*s*. per dozen. Several new varieties of the present season, 1*s*. 6*d*. each.—Lea Bridge Road, Essex. Dec. 2.

CHRYSANTHEMUMS.

HUGH LOW AND CO. have to offer extra fine well-shaped blooming Chrysanthemums, both Pompone and large flowering, at 9*s*. per dozen. The plants are large, well-grown, and unusually well furnished with flower buds.
Clapton Nursery, London.

NEW CHRYSANTHEMUMS.

JOHN SALTER'S collection, containing all the established favourites, and upwards of 60 new varieties of this season, is now in bloom, and may be seen every day except Sunday.—Versailles Nursery, William Street, near Hammersmith Turnpike.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s*. per lb., smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

HOLLYHOCK SEED.

R. PARKER has now ready for sending out Seed of this year's saving from the finest named varieties in cultivation, in packets at 1*s*. and 2*s*. 6*d*. each. A remittance or reference to accompany all orders from unknown correspondents.—Paradise Nursery, Hornsey Road, London.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

NONPAREIL PEAS.

WILLIAM FAIRBEARD begs to inform the trade that he is now ready to execute any orders he may be favoured with. This Pea W. F. is confident will become a general favourite both for Garden and Field culture. Price can be had on application.—Mount Pleasant Nursery, Queen Street, Sittingbourne, Kent.

FAIRHEAD'S "EARLY CONQUEROR PEA." To be had wholesale and retail of CLARKE and Co., Seedsmen, 86, Borough, London.

SUTTON'S EARLY CHAMPION PEA, WAITE'S DANIEL O'ROURKE, SANGSTER'S No. 1, FAIRBEARD'S NONPAREIL, *and all other new sorts of Seeds, may be obtained genuine, by retail, at the Grower's retail prices, from*
SUTTON & SONS, Seed Growers, Reading, Berks.

OMER PACHA PEA.

W. NICOL, GARDENER, Roslyn House, Hampstead, begs to announce that he has put his incomparable Pea "OMER PACHA" into the hands of Mr. SOMMERVILLE, Landscape Gardener, Nurseryman, &c., Garden Road, St. John's Wood, London, for Sale in sealed quarts at 10*s*. 6*d*.; and pints, 7*s*. 6*d*. The above Pea is not only the earliest, but the most prolific and best-flavoured hardy variety in cultivation. As the Stock is small, W. NICOL would recommend immediate application to Mr. Sommerville, as above.

HYACINTHS, TULIPS, ETC.

WILLIAM E. RENDLE AND Co., SEED MERCHANTS, Plymouth, *have still on hand a fine assortment of all the best Hyacinths, Tulips, Anemones, Ranunculus, Gladiolus, Sparaxis, Lilium, Crocus, Iris, Jonquille, Snowdrops, Amaryllis, and other kinds of Bulbous Roots.*

The present is an excellent time for planting them either in pots or in the ground; but the sooner the better. All orders will be properly attended to.

RENDLE'S *Catalogue of Bulbous Roots can be had in exchange for two penny stamps, on application to*
WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

LILIUM LANCIFOLIUM.

HENRY GROOM, Clapham Rise, near London, by appointment, FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that this is the best time to have Bulbs of the different varieties of this most BEAUTIFUL LILY. They are well adapted for the Flower Garden, American Borders, and Drives in Parks, being quite hardy. His Catalogue may be had on application.

NEW PERPETUAL STRAWBERRY.
"DELICES D'AUTOMNE."

A. VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer the new and Perpetual Strawberry "DELICES D'AUTOMNE." The fruit is large, delicious, and very abundant; it is certainly the best perpetual Strawberry of all. A correct drawing will appear shortly in Verschaffelt's "L'Illustration Horticole." Price, per plant, 2*s*. 6*d*.; six plants, 10*s*. 6*d*.

IMPORTANT TO POTATO GROWERS.

HAY, SANGSTER, AND CO., are now ready to send out their celebrated Stock of SEED POTATOES from prepared cuttings, now completely free from disease, of the following sorts, viz.:—

Early Ebrington Kidneys, per bushel	12*s*.	Early American, per bushel,	8*s*.
Early Oxford "	10*s*.	York Regents "	6*s*.
		Scotch Cups "	6*s*.

Package and delivery in London, 9*d*. per bushel, and 2*s*. per sack.
Newington Butts, London.

TRUE SEED POTATOES.

JOHN BELL, POTATO SALESMAN, Covent Garden Market, and Great Northern Railway, King's Cross, London, offers the following:—

	Per bushel.—*s*. *d*.		Per bushel.—*s*. *d*.
Ashleaf Kidneys	7 0	Early Regents	4 6
Lapstone	6 0	Hens, Nest	6 0
Early Cockney	9 0	Portyfolds	5 0
" Shaws	4	Orkney Reds	5 0
Scotch Cups	4*s*. 6*d*.		

Terms cash. The usual allowance to the trade.

FLUKE KIDNEY POTATOES.

FLUKE KIDNEYS, per bushel of 56 lbs. ... ... 7*s*.
IRISH APPLES, most prolific variety, and withstands the disease as well as the Fluke, per bushel of 56 lbs. ... 5*s*.
All orders to be accompanied by a remittance. Sacks 2*s*. each. Delivered to Worcester Station.
HUMPHREY CHAMBERLAIN, Kempsey, Worcester.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.
To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

SEED POTATOES.

JACKSONS' IMPROVED EARLY ASH-LEAF, 9*s*. per bushel. The celebrated Short-top ditto, 7*s*. 6*d*.; British Queens, 7*s*. 6*d*.; Early Frame and Ash-leaf Seedlings, 8*s*.; Early Yorks, 6*s*.; and York Regents from prepared cuttings, 6*s*., free to London. No charge for sacks.—JOS. WILSON, Seedsman, Ipswich.

WILD, of Ipswich, has the most magnificent CUCUMBER (Ipswich Standard) and PRIMULAS in Europe. Seeds, in sealed packets, 2*s*. 6*d*. free by post. Testimonials from the most eminent judges, with other particulars, per circular on application.

THE PAMPAS GRASS, GYNERIUM ARGENTEUM.

LUCOMBE, PINCE, & CO. have a fine healthy stock of this highly ornamental plant, well established in pots, and fit to send out immediately.

Specimens of it are now and have long been flowering in their nursery, and it is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See woodcut and description of it in *Gardeners' Chronicle* of the 4th inst.

Sizes, prices, and all particulars may be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.

READING ONION.—The true Reading Onion is so highly esteemed that MESSRS. SUTTON have annual demands for large quantities of Seed from all parts of the kingdom. The Seed is particularly fine this season, but the quantity not being more than sufficient for MESSRS. SUTTON'S retail Trade, they have none to offer wholesale. Specimens of the true Reading Onion may be seen at their STAND 278, Baker Street, Bazaar, during the Cattle Show. Price of Seed, 7*s*. per pound.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s*. per doz.; HOWARD'S PRINCE ALBERT, 12*s*. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford Dec. 2.

STRAWBERRIES FOR FORCING.

TO BE SOLD, about 4000 pots of fine strong plants, in 32 pots, of the following sorts of STRAWBERRIES:—Cuthill's Black Prince, Keens' Seedling British Queen, and Kitley's Goliah, delivered in London carriage free at 3*d*. per 100. A reduction made on large quantities. Post-office orders payable at Barnet.—W. LUCKETT, Rabbly Cottage, Shenley, Herts.

TO BE SOLD, at very reduced prices, 10,000 very strong 2, 3, and 4-year old GOOSEBERRIES and CURRANTS, of the best sorts.—For further particulars, apply to LAKE & DYER, Nurserymen, Bridgewater.

TO BE SOLD, VINES for fruiting, in pots:—Fourteen MUSCAT OF ALEXANDRIA; Three BLACK BARBAROSSA; Three BLACK HAMBURGH, grown in 12-inch pots, price 7*s*. 6*d*. each.—Apply to J. BURNELL, Builder, Aldenham, near Watford, Herts.

PEACH TREES AND VINES.

TO BE SOLD, a few PEACH and NECTARINE TREES, of best sorts, two years trained, without cutting back, have been grown on a wall under glass, and well set with fruit buds. Price 5*s*. each. Also 50 MUSCAT of ALEXANDRIA VINES, struck from eyes this year, 3 feet high, with fine roots, and warranted true. Price 1*s*. 3*d*. each. Post-office orders payable at Barnet.—W. LUCKETT, Rabbly Cottage, Shenley, Herts.

MANGOLD WURZEL SEED.

TO BE SOLD, LONG RED and YELLOW GLOBE, this year's seed, from superior stock.—Apply to R. S. HEWS, Kelvedon, Essex.

TO BE SOLD CHEAP, two handsome WEEPING ASH TREES, about 15 feet high, and 11 feet diameter.—Apply to CARTER & ELLIS, Hornsey Road, Holloway, London.

TO MARKET GARDENERS.

TO BE SOLD, a quantity of two-years-old HAZEL AND BEURRÉ DE CAPIAUMONT PEARS, GISBORNE PLUMS, WELLINGTON AND KING PIPPIN APPLES. Also a quantity of larger FRUIT TREES suitable for private family gardens.—Apply to Mr. H. WHITING, Bath Road, Hounslow.

TO BE SOLD, Eighty PINES, fruiting and succession.—Apply to Mr. GEORGE WALKER, Humberstone Nurseries, Leicester.

FRUIT TREES.—A Supplement to the Descriptive CATALOGUE OF FRUITS, published October, 1853, is now ready. It contains some useful information respecting New Fruits, &c. &c., free per post, on application to
THOS. RIVERS, Nurseries, Sawbridgeworth.

FRUIT TREES, FOREST TREES, EVERGREEN SHRUBS, &c. Catalogues of the above may be had on application to WILLIAM PRATT, Wakefield.
☞ A quantity of fine Transplanted White Thorns.

WANTED, PEACH TREES.—A few well-trained healthy Peach Trees for walls, consisting of Bellegarde and Royal George; also a few GREEN GAGE TREES for walls; a few dozen well-rooted WALNUT TREES; and a few MORELLO CHERRY TREES. All of them will require to be delivered at a Station on the South-Western Railway.—Address, stating price (which must be moderate), E., Office of this Paper.

SEED WHEAT.—Samples and Prices of RED HYBRID, NURSERY, and other kinds of Wheat from the CHALK, sent on application to Mr. H. RAYNBIRD, Basingstoke.
The Red Hybrid and Nursery are well suited for late sowing after Turnips.

LARGE FIRS AND FOREST TREES.

MESSRS. WILLMOTT AND CHAUNDY, of Lewisham, have to dispose of, at low prices, in consequence of the ground (12 acres) having to be cleared for building on, a quantity of large FOREST TREES and FIRS of various kinds; they will come up with good roots.
They have also an extensive stock of large well-grown Evergreens of various sizes, that will come up with good balls.

SPECIMEN IRISH YEWS.

THOMAS JACKSON, AND SON having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

8 to 9 feet high, and 8 feet in circumference			63*s*. 0*d*.	each.
8 "	and 4 to 5 feet	"	21 0	"
7 to 8 "	and 4 feet	"	15 0	"
6 to 7 "	and 3 to 4 feet	"	10 6	"
6 "	and 3 feet	"	7 6	"

Handsome smaller specimens at proportionately lower prices.
Kingston, Surrey.

FINE TRAINED FRUIT TREES IN A BEARING STATE.

LUCOMBE, PINCE, AND CO., have this season for Sale a remarkably healthy stock of fine trained FRUIT TREES of all the best sorts, to which they respectfully beg to call immediate attention. Prices and particulars to be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.
ESTABLISHED 1720.

DWARF PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

EDWARD PARKE FRANCIS offers a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application. Strong Trees, showing Fruit Buds, 2*s*. 6*d*. to 3*s*. 6*d*. each.
Rose Nurseries, Hertford.

PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

J. AND J. FRASER have to offer a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application.
In offering these Pears, grafted on the Quince stock, we would wish particularly to call attention to their many excellent qualities. They are very compact in growth, and most prolific in bearing, fruiting profusely while the trees are small; thus forming a great acquisition for a small garden. Planted by the side of walks, in addition to their utility, they add much to the neatness and beauty of a kitchen garden. Indeed too much can scarcely be said in favour of these miniature Pear trees; as a proof of their merit the demand for them is yearly increasing.
Strong Trees, showing Fruit Buds, 2*s*. 6*d*. to 3*s*. 6*d*. each.
Lea Bridge Road, Essex, December 2.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. Packets of seed, consisting of 20 varieties, selected from the best show flowers, 5*s.*; 12 varieties, 2*s* 6*d.*; and from good double sorts, 1*s.*

Very superior Quilled German Asters, 12 distinct varieties, separate 2*s.*, mixed 1*s.* per packet. Also Choice French Asters, 12 varieties, separate, 3*s.*, mixed, 1*s.* 6*d.* Fine Quilled African Marigolds, lemon and orange, 6*d.* per packet.

New Double Crimson ROCKET, excellent bedding plant for spring flowering, 6*s.* per dozen, or 2*l.* per 100. Double French White, 4*s.* per dozen, or 30*s.* per 100.

Saffron Walden Nursery, Dec. 2.

NEW CRIMSON DAHLIA "INCOMPARABLE."

MR. E. ABLITT begs most respectfully to announce to the Dahlia Trade that he purposes disposing of the above named splendid Seedling Dahlia in ground roots. Colour rich ruby crimson, fine shape, with great depth of well arranged petals and good centre; it has been shown at most of the exhibitions in the neighbourhood, and greatly admired. Mr. Glenny also speaks of it in very high terms as one of the best in the crimson class.

☞ See Glenny's Almanack for this year, and Lloyd's Weekly Newspaper for October 29th, initials E. A., and Nov. 11th.

Terms, Five Guineas each root.

Onehouse, Stowmarket, Suffolk.

TO THE AGRICULTURISTS OF ENGLAND.

HARRADINE'S "NE PLUS ULTRA" WHEAT.—A single ear of this wonderful Wheat, which was purchased five years ago of a soldier on tramp, who brought it from some distant country, was sown in 1849; the produce of this was again sown in 1850, and also in 1851, when it yielded at the rate of 19 coombs, 1 bushel, and 1 peck per acre. This induced me to continue its cultivation. A sheaf and a quantity of corn will be shown on Messrs. Garratts' Stand in the Agricultural Department of the Crystal Palace, by which its quality and general character may be seen.

The following Gentlemen kindly lent me portions of their land last season, to test the producing quality of the Wheat, and up to this year not one kernel has been sold for seed. The quantity sown on all the varieties of soil has in no instance exceeded 4 pecks per acre. On land of Mr. Wasdale, in the parish of Woodhurst, this Wheat was sown after Tartarian Oats, Clover, Seeds, Peas, and Tares (some being sown in February, and equally productive). On land in the occupation of Mr. Gadsby, in the parish of Godmanchester, 1 acre, the yield of which has been 30 per cent. over his own Wheat, grown in the same field, and has been tested by several Agriculturists in the neighbourhood. On land in my own possession, in Needingworth and other places (both Fen and Highland), it has been sown after Wheat, Clover, Barley, Beans, Oats, and Fallow, and in every instance has been most productive.

I am prepared to part with a limited quantity, which can be had on application to me, at 25*s.* a bushel. All orders to be accompanied by a remittance.

JOHN THANG HARRADINE, Needingworth, St. Ives, Huntingdonshire.

GRAPE VINES FROM EYES.

R. GLENDINNING has a large Stock of the undermentioned Vines, extra strong in pots, with well ripened wood, 5 ft. and upwards in the canes. Some of the kinds are new, and which have been proved and found of first-rate quality:

Black Hamburgh	Black Frontignan
The Pope's Hamburgh	Cabul
Wilmot's Hamburgh	Gronnir du Cantal
Mill Hill Hamburgh	Welbeck Tripoli
Victoria Hamburgh	Grove End Sweet Water
Muscat of Alexandria	Pitmaston White Cluster
Barnes's Muscat	Chasselas Musque
Reeves's Muscadine	Black Barbarossa
Raisin de Calabre	Muscat non de jura
White Frontignan	Chasselas de Fontainbleau
Grizzly Frontignan	Royal Muscadine
	Large White Sweet Water

Chiswick Nursery, London.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

SUPERIOR EARLY BROCCOLI.

MITCHINSON'S PENZANCE OR EARLY WHITE CORNISH BROCCOLI.—*Celebrated and invaluable for its earliness, coming into use early in February, a full-sized handsome head of excellent quality, but a shy seeder*, 1*s.* 6*d. per packet, or* 12*s. per ounce.* New Seed can be had in sealed packets of the following Agents in London:—NASH, MINIER, and Co., Strand; DAWE, COTTRELL, and BENHAM, Moorgate Street; HURST and MCMULLEN, Leadenhall Street; or from MITCHINSON'S Seed Establishment, Truro, Cornwall.—December 2.

From numerous unsolicited Testimonials we select the following:—

To Messrs. Mitchinson and Co., Seed Merchants, Truro, Cornwall

"Sirs,—I have enclosed 18 postage stamps for a packet of your Penzance Broccoli Seed, the same kind as you sent me last year. I hope I am not too late, for I am anxious to procure it, if possible, for I can bear testimony to its value as a new, early, and a superior Broccoli, for I have been cutting upwards of 30 heads every week from the beginning of February.

"Dorking, Surrey, April 6, 1854. "W. UNDERWOOD."

To Messrs. Mitchinson and Son, Seedsmen, Truro, Cornwall.

"Sirs,—I enclose you 1*s.* 6*d.* worth of stamps, and hope you will send me a small packet of the Early Broccoli you advertised last year. I have beat all my neighbours this year with your Broccoli, which has been very fine and true, and stood the winter well. "GEORGE PENDER."

"Sandgate, Kent, April 10, 1854."

To Mr. Mitchinson, Seedsman, Truro.

(Enclosed with Specimen).

"Sir,—I beg to forward you this Broccoli, one of the sort after your own name. I have had a splendid crop of them this season, many of which measured three feet in circumference, and quality excellent. Cut the first on the 11th of February. If seed is scarce, be kind enough to save two packets.—T. BICE, Gardener, Gran pound, Cornwall. April 7, 1854."

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to recommend to the attention of Gentlemen and others engaged in Planting, the following plants from his general Stock, they are in fine healthy condition. The American Plants annually exhibited at the Royal Botanic Gardens, Regent's Park, are supplied from this establishment.

RHODODENDRONS.—The following is a selection of the most admired scarlet, rose, and high-coloured varieties in cultivation; are perfectly hardy, and bloom for the most part during the month of June.

Blandyanum, fine rosy crimson	5*s.* to 7*s.* 6*d.* each.
Lady Eleanor Cathcart, vermilion rose and dark crimson spots	21*s.* 0*d.* "
Lady Wenlock, bright crimson	21*s.* 0*d.* "
Atrosanguineum, dark scarlet...	10*s.* 6*d.* "
Alaric, dark purplish crimson	7*s.* 6*d.* "
Omer Pasha, dark crimson, new	10*s.* 6*d.* "
Juba, crimson, intensely marked	10*s.* 6*d.* "
Lefevreanum, crimson, tinged with purple	10*s.* 6*d.* "
Attila, dark crimson	7*s.* 6*d.* "
The Grand Arab, fine glowing crimson	7*s.* 6*d.* "
Brayanum, crimson	10*s.* 6*d.* "
Nobleanum bicolor, crimson, white eye	7*s.* 6*d.* "
Vandyke, light crimson...	10*s.* 6*d.* "
Blatteum, dark purplish red	7*s.* 6*d.* "
Rubens, light rose	10*s.* 6*d.* "
The Duke of Norfolk, clear rose, fine	10*s.* 6*d.* "
Celebrandum, dark crimson purple	10*s.* 6*d.* "
Rembrandt, fine crimson	10*s.* 6*d.* "
Congestum roseum, fine rose, well marked	21*s.* 0*d.* "
Roseum novum, clear rose	10*s.* 6*d.* "
Leopardi, rosy purple, and very much marked ...	5*s.* 0*d.* "
Floribundum coccineum, fine	10*s.* 6*d.* "
Erectum, good crimson	7*s.* 6*d.* "
Towardianum, large rose, fine...	10*s.* 6*d.* "

For planting extensively, no kinds of Rhododendrons are better calculated for a display than the varieties of the noble Catawbiense; they are all perfectly hardy, producing fine trusses of blooms of various hues—scarlet, rose, purple, white, and spotted white. The list below contains the leading kinds:—

Catawbiense, good bushy plants, 50*s.* to 63*s.* per 100.
" larger, 1½ to 2 feet, 12*s.* to 18*s.* per doz.
" seedlings, fine bushy plants, 12*s.*, 18*s.* to 24*s.* per doz.

Catawbiense bicolor	Gloriosum
" splendens	Sherwoodianum
Album elegans	Bouquet de Flore
" grandiflorum	Melanthauma
Cæleste	Pictum
Cyaneum	Roseum elegans
Candidum	Victoria
Delicatissimum	Maculatum nigrum
Egregium	" purpureum
Everestianum	Macranthum
Finibriatum	Nivaticum
Mirandum	Perspicuum
Lindsayanum	

Good strong well established bushy plants, 30*s.* to 42*s.* per doz. Larger plants can be supplied at a corresponding advance of price.

STANDARD RHODODENDRONS.—Of these, without doubt, we possess the largest stock of really good kinds. Nothing can be more imposing when in bloom than a handsome standard. We have them 3 feet to 5 feet stems, and handsome symmetrical heads. The price of such would range from 42*s.* to 105*s.* each.

Rhododendron ponticum, good plants, 10*s.* 6*d.* per 100; larger, 1 to 1½ to 2 feet, 12*s.* 6*d.*, 15*s.* to 25*s.* per 100. This is especially worthy the attention of planters; it will thrive in any soil, and in the most severe weather; is never injured by hares or rabbits. Unquestionably it is by far the best shrub for under cover.

KALMIA LATIFOLIA, good bushy plants, 60*s.* per 100; larger, 12*s.*, 18*s.* to 24*s.* per dozen.

HARDY HEATHS, in 20 fine, named, varieties, many of them well suited to form edgings for larger clumps, 35*s.* to 42*s.* per 100.

HARDY AZALEAS.—A good assortment, if left to our selection, suitable for extensive planting, 1 to 1½ and 2 feet, 37*s.* per 100. The very best selected Ghent and other varieties, 18*s.* to 30*s.* per dozen. These produce flowers of all colours—scarlet, rich orange, yellow, rose, and white.

STANDARD ROSES, of the most approved Perpetual and Bourbon varieties, 3 to 4½ feet stems, 18*s.* per dozen.

PINUS Douglasi, handsome seedling plants, 3 to 4 and 6 feet.
" insignis; we strongly recommend our stock of this justly admired Fir, all of which are from seed, 2 to 3, 4, & 5 ft.
" cembra, 3 to 4 and 5 feet.—Pinus excelsa, 3 to 6 feet.
" macrocarpa, 2 to 3 feet.
" Lambertiana, very handsome, 3 to 4 feet.
Araucaria imbricata, splendid formed specimens, 2 to 4 feet.
Cedrus deodara, of all heights, from 1 to 8 feet. We have a large quantity about 4 to 6 feet.
" Africana, 3 to 4 feet.
" Lebanon, handsome grown specimens, 3 to 6 feet.
Cryptomeria japonica, 3 to 12 ft.—Libocedrus chiliensis, 2 to 3 ft.
Fitzroya Patagonica, 2 feet.
Cupressus Goveniana, 3 to 4 feet.
" Lambertiana, 3 to 4 and 5 to 6 feet.
Irish Junipers, 4 to 5 feet.—Irish Yews, 4 to 8 feet.

The above-named Coniferous Plants have been frequently transplanted, are perfect specimens, and have never been grown in pots. Prices will be forwarded on application.

J. W. begs respectfully to solicit an inspection of his stock, from those who are engaged in planting. A Catalogue, containing full descriptions of his celebrated Collection of Rhododendrons, as exhibited by him at the Royal Botanic Gardens, Regent's Park, can be obtained by inclosing two Postage Stamps.

THE NEW CHINESE POTATO (DIOSCOREA JAPONICA).

MR. JOHN HENDERSON,

Formerly of the Firm of JOHN A. HENDERSON & Co., Pine Apple Place, London,

HAS the pleasure of informing the Public that he has just completed the Purchase from M. PAILLET, of Paris, of his entire Saleable STOCK of the above introduction from China, the nutritive properties of which are said so far to surpass the ordinary Potato that it is likely, not only to act as an auxiliary, but entirely to SUPERSEDE that valuable but uncertain esculent.

The most satisfactory results have followed from personal experiments, and proved that when cooked in the ordinary manner, from the large amount of FARINACEOUS properties it contains, it can NEVER become waxy, as is too generally the case with the Potato. Its FLAVOUR resembles in delicacy an early ASH-LEAVED KIDNEY; but, independent of the above excellent qualities, there is every probability of its taking a still more important position in the ECONOMY of this country, for, when dried and reduced to powder, it is equal to the best ARROW-ROOT; or mixed in the proportion of one-third with two-thirds of wheaten flour, it makes an extremely light and wholesome BREAD, as well as very superior PASTRY.

Messrs. VILMORIN & Co., speaking of it, observe:—"Of all the esculent roots proposed as substitutes for the diseased Potato, the DIOSCOREA JAPONICA is certainly the only important one. It is easily propagated. The tubers are large and long, the flesh very mealy and devoid of any peculiar or disagreeable flavour. The DIOSCOREA JAPONICA is, in our opinion, a PRECIOUS ACQUISITION."

M. PELÉ, Horticulturist, Paris, in his Supplementary Catalogue of this autumn says:—"A new alimentary root, introduced into France by M. MONTIGNY, French Consul in China. Serious experiments have shown that this tuber will be much more advantageous to cultivate than the Potato, both in regard to its QUALITY as well as PRODUCE."

M. PAILLET, to whom the Imperial Society of Agriculture and Commerce of France has awarded the sum of 3000 francs as encouragement for having brought it into cultivation, also notices that "this tuber attains at least 1 to 2 lbs. weight. In its growth it is less delicate than the Potato, which unfortunately has of late years much degenerated. It does not require particular care, and its abundant produce amply repays cultivation. Its taste is pleasant, and being a root which contains a large amount of FARINA, will be a great addition to the FOOD OF THE PEOPLE as soon as it becomes generally known. It is so HARDY that it has passed the winters of 1853-4 in the open ground, without having in the least suffered from frost. It is also found that the STEMS and LEAVES, which are very numerous, form an EXCELLENT FOOD FOR CATTLE."

Tubers, with description of the Chinese Mode of Culture, to be obtained of MR. JOHN HENDERSON, KINGSKERSWELL, SOUTH DEVON, at the following prices, for cash only:—

4 Tubers ... ... £0 10 0 | 10 do. ... ... £1 2 6 | 50 do. ... ... £5 5 0 | 100 do. £10 0 0

Post-office orders are requested to be made payable at Newton Abbot, South Devon. The usual discount allowed to the trade when not less than 50 are taken.—P.S. All orders unaccompanied by a remittance will be considered as not received.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION

FOR

PRESERVING POTATOES, WHEAT, AND OTHER SEEDS.

THIS highly VALUABLE PREPARATION preserves POTATOES, WHEAT, and all other GRAIN, from the RAVAGES OF DISEASE. The CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regent's Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON'S process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,

"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by all Seedsmen and Chemists, and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three, or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

TO THE SEED TRADE.

MESSRS. ARTHUR HENDERSON AND CO. are now prepared to supply SEEDS of the following recent introductions.

N.B.—Mr. W. H. DUNNETT, Seed Grower, Denham, Essex, will also execute all orders intrusted to him with the greatest care and attention.

WHITE TOPPED CLARY, a fine showy hardy annual, remaining a long time in flower—
1 oz. 5s. | 4 oz. . 15s. | 8 oz. ... 25s. | 16 oz. ... 40s.

LIMNANTHES SULPHUREA ODORATA; yellow ground, edged with white and rose-coloured stamens; a beautiful trailing hardy annual, very sweet scented, and throwing off its fragrance like the Mignonette, and continuing in flower for a considerable period:
1 oz., 10s. 0d. | 4 do., 35s. | 8 do., 60s. | 16 do., 100s.

DIANTHUS DUNNETTI SUPERBUS; very dwarf, dark Sweet William—
1 oz.. 20s. | 2 oz., 35s. | 4 oz., 63s. | 8 oz . 105s. | 16 oz.. 163s.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for GERANIUMS (show and fancy), FRENCH GERANIUMS, FUCHSIAS, VERBENAS, FAIRY ROSES, CHRYSANTHEMUMS, HELIOTROPES, CINERARIAS, CALCEOLARIAS, PRIMULAS, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

The stock of show Geraniums exceeds 50,000, and comprises upwards of 750 varieties, amongst which almost every known kind will be found. The newest sorts, such as Carlos, Virginia, Rosa (Foster's), Leah, Pictum, Marginatum, Empress, Neatness, &c., can be had at 3s. 6d. each, or 40s. per dozen. The older varieties from 9s. to 25s. per dozen.

The selection of FRENCH GERANIUMS consists of 40 distinct sorts (exclusive of those English Geraniums which some class with them), at 2s. 6d. each, or 25s. per dozen.

SEEDLING CINERARIAS (10,000), from seed of first-rate flowers, at 4s. per dozen, in 60-sized pots.

20,000 SEEDLING HERBACEOUS CALCEOLARIAS now on hand at 4s. per dozen in 60-sized pots. These flowers have been raised from the seed of the best of last year's stock, which received general praise.

An immense quantity of good fimbriated PRIMULAS at 4s. per dozen in 60-sized pots, and 6s. per dozen in 48's.

CHRYSANTHEMUMS (Lilliputian and large flowering) at 6s. and 9s. per dozen for plants which will flower this season. Large magnificent plants at 18s. and 15s. per dozen—all the best sorts.

The foregoing have been selected as examples only, it being impossible within the limits of an advertisement to afford particulars of a stock so extensive; Catalogues will, however, be forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, PROPRIETOR.

CHOICE GREENHOUSE PLANTS, &c.—We beg respectfully to offer the following, all of which are handsome well furnished plants, and such as cannot fail of giving satisfaction to those who may honour us with their commands.

EPACRIS, in 50 of the most choice varieties, fine bushy plants, 1½ to 2 feet in height, 12s. per dozen; smaller do., 9s.

ERICAS, fine bushy plants, in 48-sized pots, of all the best kinds in cultivation, 12s. per dozen; smaller do., 9s. (The above are well deserving the notice of the trade, prices of which may be had on application.)

CAMELLIAS, of the handsomest and most select varieties, well furnished with flower buds, 24s. and 30s. per dozen.

GREENHOUSE PLANTS, comprising an extensive collection of the choicest kinds, fine selections from which will be made at 12s. per dozen.

CINERARIAS, in 20 of the very best and newest kinds, for 25s. the set.

MIMULUS, in 6 new and splendid varieties, for 6s. the set.

TREE, or PERPETUAL FLOWERING CARNATIONS.—These new and beautiful introductions, so well adapted for affording a profusion of bloom throughout the winter months, 18s. per dozen.

CARNATIONS AND PICOTEES.

The finest varieties, by name, in strong healthy Plants ... ... 18s. and 24s. per doz. pairs.
Fine mixed border ditto ditto ... ... 9s. „
True old Clove Carnation ditto ditto ... 12s. „
PINKS, finest varieties by name ... 9s. to 12s. „
PHLOXES, finest new varieties ... ... 9s. per dozen.
PÆONIAS, in 20 choice kinds, for 1l.
ROCKETS, per doz.:—New double crimson, 12s.; double white, 3s.; double purple, 4s.
PRIMROSES, per doz.:—Double white, 4s.; crimson, 12s.; yellow, 5s.; purple, 4s.; lilac, 4s.
BELGIAN DAISIES, in 50 new varieties, 4s. per dozen.
HERBACEOUS PLANTS, in very choice variety, 30s. per 100, or 6s. per dozen.
LILY OF THE VALLEY, strong for forcing, 5s. per 100.
HYACINTHS, the finest for glasses or forcing, 9s. per dozen.
TULIPS, extra fine mixex, all from named flowers, 12s. per doz.

CHOICE FRUITS (WARRANTED TRUE TO NAME.)

APPLES, Standard, in best selection, good heads,			9s.	0d.	per doz.
„ Dwarf	ditto	ditto	6	0	„
„ Trained	ditto	ditto	30	0	„
PEARS, Standard	ditto	ditto	12	0	„
„ Dwarf	ditto	ditto	8	0	„
„ Trained	ditto	ditto	30	0	„
PLUMS, Dwarf	ditto	ditto	9	0	„
„ Trained	ditto	ditto	36	0	„
PEACHES, Df. trained, in fine strong plants,			36s. to 60	0	„
NECTARINES, Dwarf trained	ditto		36s. to 60	0	„
APRICOTS	ditto	ditto	36s. to 60	0	„
CHERRIES, Standard, in fine variety,	ditto	...	12	0	„
„ Dwarf	ditto	ditto ...	9	0	„
„ Trained	ditto	ditto	36s. to 42	0	„

FASTOLFF RASPBERRY (true), as originally sent out by YOUELL & Co., strong, well-rooted canes, 15s. per 100; Large White Raspberry, 24s. per 100; New Monthly Fruiting, 24s. per 100; Belle de Fontenay, 2s. per dozen.

GOOSEBERRIES, 25 of the finest varieties (good bushes), selected for size and flavour, 30s. per 100, or 4s. per dozen.

CURRANTS.—Improved large White Dutch, Black Naples, Raby Castle (red), and large Red Grape, 4s. per dozen; Knight's Sweet Red, 6s. per dozen. These are the most desirable kinds in cultivation, and are highly recommended.

ASPARAGUS, Giant, 2 years	per 100	2s.	6d.
„ „ 3 years	„	3	6
RHUBARB, Myatt's Victoria	per doz.	8	0
„ „ Linnæus	„	8	0
„ Mitchell's Royal Albert	„	8	0
„ Hawke's Champagne, new ...	each	2	0
SEAKALE, strong, 1 year	per doz.	5	0
„ „ for forcing	„	10	0

All orders of 2l. and upwards are delivered carriage free to London, Hull, and Newcastle-on-Tyne, as well as to any Railway Station within 150 miles of the Nursery. Communications by Steamer and Railway to all parts of England, Ireland, and Scotland, as well as the Continent. Post-office orders to be made payable to YOUELL & Co.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

TO PLANTERS OF CEDRUS DEODARA.

TO BE SOLD, about 200 handsomely furnished and perfect specimens (from seed) of the above, from 3 to 5 feet in height, all transplanted last season.—For particulars, address "Cedrus," Office of this Paper.

THE FOREST, THE PARK, THE SHRUBBERY, AND THE GARDEN.—*Noblemen and Gentlemen requiring Trees, Shrubs, or Fruit Trees during the present Autumn should obtain* RENDLE'S *New Autumnal Descriptive Catalogue, which can be had on application from*

WILLIAM E. RENDLE & Co., Nurserymen and Foresters, Plymouth. Established 1786. New Seeds, growth of 1854. Arrangements are now being made at this establishment for a large supply of genuine and good Seeds for the coming season.

NOW READY.

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready, and should be ordered forthwith, by which a full supply of every kind of Vegetable Seed required during the whole year will be secured (including the best sorts yet introduced), and at a very small cost, viz.:—*

No. 1 Collection	... £3 0 0	No. 3 Collection	... £1 5 0
No. 2 do.	... 2 0 0	No. 4 do.	... 0 15 0

The quantities in each collection being apportioned to the size of the garden, INSTRUCTIONS ON CULTIVATION will be enclosed with Nos. 1, 2, and 3. To secure the best sorts, orders should be given immediately, addressed

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 2, 1854.

MEETINGS FOR THE ENSUING WEEK.
TUESDAY, Dec. 5—Horticultural ..... 2 P.M.

A MISPRINT in the remarks we made last week upon the winter in the Crimea, induces us to add something to the evidence obtainable from the relations of PALLAS, whose personal experience outweighs all conjectural assertions.

The severe winter to which allusion was made by him seems to have been that of 1787, not of 1847, as was stated, owing to a slip of the pen; hard winters are also recorded by PALLAS in 1798-9, and in 1799-1800, but owing to the confused language of the English translation of his works it is not clear whether it may not have been 1799-1800, instead of 1787, when Kaffa bay and creeks in the N.E. of the Euxine were frozen over; even then, however, we are told that the mercury of the thermometer did not sink more than 18° below freezing in the bleak regions adjoining the Sea of Azoff. "Such inclement winters," he adds, "as well as copious falls of snow, are not very common; and the latter seldom remains on the ground throughout that season." This, be it observed, is mentioned of the Crimea generally, and does not seem to apply at all to the southern shore.

The dromedary, or camel, is a common beast of burthen. What says PALLAS of that? "*The mild winter of the Crimea* is very favourable to the habits and propagation of camels; and these quadrupeds are more numerous than is commonly supposed. In the year 1796 a thousand camels were bought up in Crim Tartary for the use of the army in Persia, and they were procured in a few weeks without any remarkable diminution of their numbers."

Speaking of sheep, the same authority reports that "in winter large flocks are driven into the mountains, on the Chersonesus, and other places along the sea coast *where the falls of snow are slight*, so that they find a scanty subsistence throughout the winter."

The winter of 1793-4 was considered a hard one, though not so severe as the two already mentioned, and even then the thermometer never fell below 8° Fahr., although ice drifted down from the Sea of Azoff, as it usually does, rendering the vernal months "cool." Of Bakshiserai, the Russian present head quarters, we are told that being sheltered from north winds, the weather is generally mild throughout the winter. Sebastopol, "in consequence of the shelter afforded by the mountains to the north and east, is milder in the winter than many other parts of the Crimea."

On the 4th of April, PALLAS found near the road between Balaclava and the village of Kamara Peaches and Almonds in flower in the gardens, and a variety of wild plants blossoming in the woods, among which was the southern *Clypeola*, unknown in a wild state where winters are severe.

Among the wild plants of the country the Terebinth (*Pistacia Terebinthus*), the Jujube (*Zizyphus Jujuba*), the Pomegranate, and the Christ's Thorn (*Paliurus aculeatus*), are mentioned by the writers on the Crimea—not to mention the Arbutus Andrachne. There is not a gardener in England of any experience who does not know that all these plants indicate a better climate than our own; the climate, in fact, of the northern shore of the Mediterranean. We also learn from PALLAS not only that wine is made from the vineyards of the Alma, but that the Vines are trained over trellis and up poles—a circumstance by itself proving that the climate is Italian rather than Russian. But "common things" like these are beneath the notice of some people, although they convey information of much more practical value than even thermometrical registers, which, we may add, entirely support the foregoing statements. As to feet and fingers coming off from cold where camels breed, and the vegetation is Italian, we suppose we shall hear no more of that.

At all events there is no gainsaying either the particular or general facts now shown to be connected with the climate of the south-western part of the Crimea. We have purposely taken the most familiar examples we could find in the excellent records left by PALLAS. Had we been so disposed we might have introduced his account of Alupka, a place more to the north-eastward, where Oranges require no greater protection in winter than is afforded by the slight shelter of a rude Tartar hut; but such an instance is no doubt local and exceptional. Upon the whole we cannot doubt that the winter climate of the scene of operations is in no degree worse, at the worst, than that of Hampshire and Sussex; but probably is more like that of Rome, and certainly bears no resemblance to the extravagant exaggerations of some of the correspondents of the daily press. And when we remember that the Duke of WELLINGTON led his troops across the Pyrenees in November, notwithstanding the resistance of such an army as the French and such a commander as SOULT, we cannot believe that mere winter weather in the south-west of the Crimea, even in the face of Prince MENSCHIKOFF, can have any danger for British soldiers and their brave allies.

OF the many distinguished men of science who have passed away from amongst us during the present year, there is none whose death is so widely and deeply mourned as that of PROFESSOR EDWARD FORBES. Endowed with real genius, possessing many and highly cultivated talents, no less conspicuous as an original thinker than as a hard and conscientious worker; accomplished in literature and art, equally graceful and ready with pencil or pen, in the lecture-room as in the closet, and with far rarer qualities than all these—the purest and most disinterested love of science, and the most generous appreciation of the labours of others—it is no wonder that he was beloved and admired beyond any natural historian of his day.

We must refer our readers to the *Athenæum* and *Literary Gazette* for details of his career as a geologist and zoologist, which commenced with a child's attempt to form a museum of nature on the shores of the Isle of Man, and terminated in the Professorship of Natural History in the University of Edinburgh, long the height of his ambition. Prof. FORBES was born in 1816, and from his earliest years devoted the whole powers of his mind to Natural History in its most comprehensive meaning. Fortunately he had at the commencement of his studies means at his disposal, but his inclinations were divided between science and art; he commenced with the fine arts and studied in London, but soon finding that progress in science was incompatible with the necessary devotion to the easel, he abandoned the latter; not, however, before he had obtained considerable proficiency in the practice and great knowledge of the theory of drawing and painting. In pursuance of a new plan he chose Edinburgh as a school, and medicine as the study which would best fit him to become a naturalist by profession. There he resumed his zoological pursuits with redoubled ardour, collecting on the land, the shore, and in the depths of the sea; there, too, he became attached to botany, attracted (as were hundreds of his day) by the zeal and enthusiasm of Dr. GRAHAM, then Professor of Botany at that university. At that time Edinburgh was conspicuous amongst the schools of Britain for the number of devotees to science amongst its alumni; and these EDWARD FORBES'S genius and accomplishments, his singularly amiable and lively disposition, and agreeable manners and love of science soon attracted to himself; so that he became the centre of a choice knot of young and ardent naturalists. Excursions into all parts of Scotland, Scandinavia, France, Germany, Italy, and Algeria, alternated with his college sessions, and to these he was impelled by the opportunities they afforded him of studying geographical distribution, morphology, and the habits of plants and animals. Some of his earliest contributions to botany were the fruits of these excursions, and appeared in various periodicals between the years 1836 and 1840.

In 1841 FORBES was appointed naturalist to the Syrian expedition for exploring the sites of ancient cities in that part of Asia Minor; there he employed himself during his dangerous excursions in the interior chiefly in the study of Testacea and plants,

also in sketching and sharing the hardship and excitement of antiquarian research; much of the time was also spent at sea on board H.M.S. Beacon, when he collected materials in marine zoology and botany for developing the laws that regulate the distribution of life in the depths of the ocean. During one of these excursions he was seized with an all but fatal fever, and contracted the seeds of the organic disease that 12 years later laid him in an early grave. He returned to England in 1842 with invaluable collections, and a portfolio of drawings of scenery, antiquities, plants, and animals, men and their manners, that for extent, variety, scientific value, and artistic skill, have never been rivalled by any naturalist. A sum of money was voted by the treasury for the publication of these, which Prof. Forbes intended appending to a treatise on the "Natural History" of Aristotle, a work for which he had collected ample materials, and which he alone was capable of executing. In the meantime he published, in conjunction with Lieut. Spratt, a narrative of his journeys, a classical work richly stored with episodes in natural history, and especially in observations on the botany of Asia Minor and the Ægean Sea.

On his return to England, Professor Forbes found himself elected to the chair of Botany in King's College, London, where he became a most valuable and efficient teacher; his lectures were greatly applauded, his devotion to his students was only equalled by their admiration of him, and his introductory address on taking the chair, which was printed at the request of the College, is not less conspicuous for its eloquence than for its originality and sterling merit. Soon after this he accepted the posts of Curator and Assistant Secretary to the Geological Society of London, to the duties of which he applied himself with a zeal and ability that gave him a high rank amongst European geologists, and led to his occupying the President's chair, ten years afterwards. From this Curatorship he was appointed Palæontologist to the then rapidly increasing Geological Survey of Great Britain, and latterly he became Professor of Zoology and Palæontology in the Government School of Mines. From this he was finally removed early in the present year to the Professorship of Natural History in Edinburgh, vacated by the death of his old master, Prof. Jameson. His departure from London was considered almost in the light of a national loss, and a reflection upon the Government whom he had served so devotedly and successfully. The assurance that Edinburgh possessed unrivalled advantages for fostering a school of natural science, and that Forbes was of all men the best qualified for forming it, reconciled his friends to the step he had taken in a public point of view, whilst in a private one they rejoiced that he had so early found an arena altogether suited to his talents, and a prospect of reaping the emoluments he so richly deserved. He had scarcely thrown out his masterly plans for the accomplishment of his great scheme, and he had not yet enjoyed the fruits of his labour, when he was seized with an inflammatory attack upon an organ that had become affected during the experience and hardship of his Syrian journeys, and which had been for many years extensively diseased, and this carried him off at the early age of 38.

We have reserved a few lines to devote more especially to Professor Forbes's career as a Botanist; and it is indeed wonderful how the author of so many and varied geological and zoological treatises should have found time to aim at original researches in any other department of science; and that doing so, the motto "nil tetigit quod non ornavit" should still apply with so much force to all he did. This was mainly due to the early age at which he acquired its rudiments; to the efficient practical training in systematic Botany and collecting that he received in Edinburgh; to his quick perception of affinities; to his philosophical views of morphology, distribution, structure, functions, and the mutual relations of all these; to his mind being richly stored with the literature of the science; to the wide experience obtained during his travels, and finally to that heaven-given power of generalization and abstraction that he so eminently possessed. Besides many smaller papers alluded to above, he published a most important one in the Records of the Geological Society upon the relations of the existing Fauna and Flora of Great Britain to certain geological changes, a most remarkable work, opening a wide field of speculative research into every branch of natural science, and embodying a mass of information on the natural history of the British Islands. Of more direct value to botanists are Prof. Forbes's contributions to Johnstone's physical atlas, to which he supplied the geological and palæontological maps of the British Isles, and another on the distribution of marine life over the globe.

It is difficult to sum up, at a few days' or even weeks' notice, the prominent and most useful labours of a man who has done so much by precept and by example, and who for his years has accomplished more than any other naturalist of his day. As a practical naturalist Professor Forbes will always be held in the highest esteem, for the efficient purpose to which he applied the dredge; for his remarkable powers of collecting with system and judgment in all departments of natural history; for his labours as Curator of the Geological Society's Museum, and in that of the Geological Survey: as an original and philosophical naturalist for his many essays on the distribution of life, in time and over space, "per mare per terras:" as a systematic writer, for his paper on Indian fossils in the "Geological Transactions," his many monographs and local faunas, his able work in conjunction with Mr. Hanley on the British Testacea, and his beautiful History of British Starfishes: as a travelling naturalist for his extensive European, North African, and Oriental journeys, and for his volumes of travels in Syria (by himself and Lieut. Spratt): as an artist for the accurate and beautiful sketches and views in his travels, for his illustrations of his book on Starfishes and other works; and, above all perhaps, for his sometimes humorous and sometimes sentimental, but always exquisitely graceful and artistic vignettes and tail-pieces to his own books, and those of some of his friends: as a public teacher, for his lectures at King's College, the Royal Institution, the Government School of Mines, Marlborough House, and at many other schools and institutions throughout the kingdom. And, finally, his memory will always be held in the most affectionate regard by all that knew him, for his sterling moral worth, integrity of purpose and strength of mind, utter absence of jealousy, incapability of detraction, his noble temper, untouched by flattery and good or ill-fortune, and by his generosity in words and in deeds. In the wide circle of our experience we can point to no more brilliant example of a naturalist's career, short as it was, nor to any devotee to science more universally and deservedly beloved. *J. D. H.*

New Plants.

104. Trichocentrum Pineli.

T. columnæ alis truncatis denticulatis, labelli oblongi emarginati callis 2 linearibus oblique truncatis parallelis glabris dentibusque totidem juxta basin hirsutis, calcare pedicello subæquali apice uncinato.

We have received a specimen of this little plant from Messrs. Veitch; and we have it in a wild state, with a coloured drawing, from our friend the Chevalier Pinel, who found it near Rio. It is much like *T. fuscum*; but the wings of the column, the callous lines on the lip, and the peculiar spur, readily distinguish it. In Brazil the sepals and petals are cinnamon brown, the lip white with crimson freckles near the base, and the leaves are spotted with red, as in *Oncidium Papilio*; the live specimen was paler in all respects.

105. Trichocentrum purpureum.

T. columnæ alis dolabriformibus denticulatis, labelli obovato-oblongi emarginati callis 2 linearibus obtusis adjecto minore utrinque juxta apicem dentibusque totidem juxta basin glabris, calcare ovarii longiore crasso obtuso sub-falcato.

This also was sent us the other day by Messrs. Veitch. It has the dull olive green sepals and petals of T. fuscum, but its lip is purple, and its thick curved spur is peculiar. Like all the others, it is a stemless fleshy-leaved epiphyte, with little radical one or two-flowered scapes. The native country is said to be Demerara. *Plectrophora iridifolia* of Focke is another species of the genus.

VEGETABLE PATHOLOGY.—No. XLVIII.

213. If it be granted that the first formation of useful or ornamental varieties of plants, and their preservation true to their distinctive characters, depend upon an abnormal debility, whether constitutional or induced by artificial means, though such conditions cannot be recognised as due to disease in the agricultural or horticultural definition of the term, a tendency to sport, that is, to give rise to multitudes of variations for the most part difficult of preservation, will readily be allowed to be symptomatic of constitutional weakness, while the inclination to revert to the original type is so far a symptom of returning strength. This tendency is in part original, in consequence of which varieties arise, but in far greater measure is due to the facility with which varieties are impregnated even in a state of nature with their kindred pollen and the increased susceptibility of their produce. It is to this cross-breeding that by far the greater part of the most valuable objects of cultivation is due. The produce of hybridisation between two cognate species is for the most part barren, while cross-breeding, which is not, strictly speaking, hybridisation, is often productive of increased fertility, though the resultant forms are for the most part extremely transient. There is in fact but little certainty in cross-breeding, while the results of muling are to a great extent normal.

214. All varieties and variations of plants are not, however, equally fleeting. There is a marked constitutional difference in this respect between different races, and as regards particular organs.

Mr. Knight informs us that the tendency to sport may be greatly checked by impregnation with the pollen of a pure male parent of permanent habits. The question as to the influence of the male and female parent respectively on the different organs is far from settled, the experiments of Knight and Herbert leading to precisely different results.

215. If the main objects of cultivation are really due to what, strictly speaking, must be considered as diseased conditions of the parents from which they spring, it is not surprising that those qualities which make them answer the purposes of man should be accompanied by others which impede his views. That there is under the present improvement both of the system of cultivation and of the varieties cultivated, in which every abnormal peculiarity, so long as it is useful, is increased to the greatest possible degree, a tendency to decay which did not exist some 20 years ago, will scarcely be denied by any one who is intimately acquainted with our farms and gardens. It is notorious, for instance, to take one example by way of illustration, that the cultivation of Cucumbers, which was once considered the most certain of success, is now precarious even in the hands of the best cultivators; while that of Melons, which always demands a more than ordinary degree of skill and care, is in many localities all but hopeless. It is impossible to assign the actual cause of this tendency to decay, though it may in some measure be surmounted by constant care and observation of the conditions under which alone health can be preserved, but that it does exist to a great extent, and that, from whatever cause it may have arisen, it has become constitutional to a very great extent, is almost certain. The tendency to decay in such cases is sometimes confined more especially to particular parts, and those generally the most succulent, but in the instances just mentioned, though it is not exhibited very often till the fruit is formed, it sometimes commences at a very early stage of growth, insomuch that the plant perishes even before the flowers are fully formed.

216. This tendency is usually accompanied by a difficulty of healing, which is peculiarly indicative of constitutional vice. In the vegetable, no less than the animal world, where health is present, there is a power of reparation which at least protects all subjacent parts from external injury. The young wood, for instance, in trees, where the death of the generative tissue is not immediately caused by exposure to drying air, throws out, when denuded, a cellular mass, which is soon resolved into wood and bark, and similar effects are produced in other parts. I have now before me Pears, whose surface was in a great measure eaten off by caterpillars in the early part of the summer, in which a new cuticle has been formed perfectly continuous with the old, though covered with the scurfy remains of the exposed external cells. Even in some cases of disease, arising from other than constitutional causes, as in the Potato scab, a new cuticle is formed beneath the old, doubtless preventing the complete destruction of the tuber. In the cases, however, under consideration, the tissues which lie immediately beneath the exposed cells have no strength to repair the damage, or at any rate to form a sufficient barrier to the penetration of noxious influences; and so an additional cause of decay exists which greatly aggravates the original evil. Even the necessary shortening of the branches, or the removal of superfluous leaves, in such cases too often induces decay, which is rapidly communicated to the main stem, of which a more or less speedy death is the consequence.

217. In such cases fungi are frequently produced in the decayed tissues, and when produced propagate the mischief far more speedily than would have been the case without their agency, but there is no tendency in diseased tissues to produce them, nor will they appear without previously existent germs.

218. Each plant has its own peculiar attributes, and can be maintained in health only under certain outward conditions, which may be more or less definitely circumscribed. The alteration of these conditions may be more or less destructive, but such destruction is not to be ascribed to constitutional weakness, inasmuch as under normal circumstances it answers the end for which it was created. Such peculiarities are but rarely, and only after many generations, altered by cultivation. In most instances what is called acclimatisation, is, we believe, impossible, except by the production of new races. Out of all the varieties of potatoes which have been produced, there is not one which can resist a few degrees of frost, a circumstance which makes it absolutely impossible that the plant should ever become wild in Europe. *M. J. B.*

ORIGIN OF THE PEAR TREE, ITS PROGRESS, AND SUCCESS.

(*Continued from p. 757*).

In the endeavours to obtain new and improved varieties of fruits by seed, the chemist, Van Mons, of Brussels, was the first in Belgium who was guided chiefly by the idea of raising seedlings from the pips of fruit of vigorous trees in the first instance, and continually resowing the seeds obtained from the last generation of seedlings, in order to obtain improved fruits, in form and taste. He is also the only one who has stated the principles by which he was guided in his researches. These were commenced at Brussels, about the end of the last century, in a nursery bearing the name of La Fidélité. Called at a later date to be Professor of Chemistry at the University of Louvain, he transferred, in 1819, his numerous seedlings to that place, not, however, without losing a great many; and he continued his essays till 1842, the time of his decease. After continuing his researches for 25 years, the first catalogue, indicating the new varieties obtained, was

printed at Louvain in 1823. Some of these varieties have been described by the author, and published in the following works :—

Annales des Sciences Naturelles : MM. Tobard et Weissenbruck, 1819-30. New [American] Orchardist, by Mr. Kenrick : Boston, 1833. American Gardeners' Magazine, T. G. Hovey : Boston, 1835. Systematisches Handbuch der Obstkunde, J. G. Dittrich : Jena, 1837. Album de Pomologie, par A. Bivort, and others : 4 vols. 4to, 1847—1851. La Pomonomie Belge, of the late Van Mons, appeared at Louvain in 1835 and 1836, in 2 vols. 8vo.

In 1845 the nurseries of Louvain were given over by the heirs of Van Mons to M. A. Bivort, and the collections transferred to the gardens of the village of Geest St. Remy, near Jodoigne. In consequence of the vigorous trees having been transplanted into a less favourable soil than that of Louvain, many of them again fruited in 1847 and 1848. The new and good varieties were named and sent out, at least a great number of them ; nevertheless they are still but little known, and not widely distributed. A better knowledge of them would therefore be advantageous to amateurs. M. Bivort, having retired from business in 1852, formed a society, a committee of which is charged to ascertain the good varieties which may be found among those that have not yet fruited, and of which, consequently, the merits have not been proved. Major Esperen, of Mechlin, commenced researches of the same kind somewhat later than Van Mons, and he also obtained results deserving notice.

M. Bouvier, of Jodoigne, one of Van Mons' pupils in pharmacy, also turned his attention to the raising of new varieties of Pears from seed. Like Van Mons and Esperen, Bouvier has left a number of very vigorous and hardy varieties of Pears, and of good quality ; but the two last have not left any account of their mode of proceeding. We may remark, that these three gentlemen had no other object than that of obtaining a good result ; and that they gratuitously distributed to amateurs and nurserymen grafts of their seedling trees, after these had borne fruit approved by themselves and their friends. Still it is certain that these essays, carried on for half a century, especially those of Van Mons, must have cost a considerable sum of money. In his nurseries at Brussels, Van Mons did not possess less than 80,000 seedlings. Persons capable of judging of the matter estimated, that at the time of his decease, which took place at Louvain in September, 1842, the nurseries must have cost a sum, including interest, of about 300,000 francs (12,000*l.*) There are few examples in the history of gardening of a like sacrifice of time, talent, and money having been made by a private individual in the disinterested pursuit of a useful object. It is with unfeigned pleasure that we state these facts, which are but little known abroad. At the same time, we take the opportunity of paying homage to the man to whom we are indebted for a greater number of fine varieties of Pears than have been handed down to us from all previous ages, and from all the nurserymen and pomologists of modern times. In his Catalogue of 1823, second and third series, several fruits are noticed by the author as being very remarkable, and to which names had been given. The following are some of these :—

94. Archiduc Jean d'Autriche ; form of Colmar Admirable.
1237. Bergamotte Pasteels ; form between Bergamotte and Doyenné.
1253. Beurré Driessen ; form of Beurré d'Hiver.
1165. Bezi Reinwardt ; form of Bezi de la Motte.
471. Bosc Desfontaines ; form of Calebasse Bosc.
893. Calebasse Bauchan ; form of Calebasse.
29. Capiaumont Lints ; form of a large Capiaumont.
134. Charlotte d'Anvers ; form of Doyenné—of little merit.
2469. Chevalier d'Onyn ; form between that of the Rousselet and Passe Colmar.
2143. Colmar Herzog ; form of Passe Colmar, a large fruit.
93. Colmar Gossart ; form of Colmar, excellent.
2466. Comte de Lacepède ; form of Calebasse Bosc.
2009. Duc de Bedford ; a delicious variety.
72. Duc de Saxe Weimar ; form of Grand Bretagne Fondante.
549. Du Petit Thouars ; form of Royale d'Hiver.
130. Grand Duc de Toscane ; form of the Bergamot Sans Pepins.
181. Louise Bonne Réal ; form of Louise Bonne.
248. Marie Louise Slightinger ; form of Marie Louise.
252. Marquise Stas ; form of Marquise.
2636. Mertens-fils ; form of Gros St. Germain.
36. Pentecôte Hervy ; form of Bergamotte de Pentecôte or Easter Beurré.
891. Prince d'Orange ; form and flavour of Passe Colmar.
1527. St. Germain Tacotat ; form of St. Germain.
695. Van Gobbelschroy ; form of d'Espagne, extra.
825. Van Hultem ; form between that of Doyenné Gris and Capiaumont.
2054. Vannes de St. Haye ; form of Superb Urbaniste.

Another series of varieties indicated by a designation of form only, need not be repeated here, although they are worthy of recommendation according to the opinion of the author. Alas ! with few exceptions, these varieties no longer exist in the collections of amateurs, nor in the nurseries, at least not in ours. Van Mons had numerous correspondents, in America especially, in Germany, England, and France ; and he frequently sent grafts of his new Pears with numbers only. The above indications may, therefore, prove useful to those who may have received grafts, but are not in possession of the catalogue of 1823. *J. de Jonghe.*

(To be continued.)

BABINGTONIA CAMPHOROSMÆ.

This, although not one of the most showy of our hard-wooded plants, has the good property of flowering in autumn, when hard-wooded specimens in bloom are scarce, and being of a free elegant habit of growth, and flowering profusely as it does for many weeks in succession, it is well worth a place in every collection. It is perhaps one of the easiest of greenhouse hard-wooded plants to propagate ; cuttings selected of the young wood in a half ripe state, and treated in the ordinary way, very soon emit roots. The cuttings should be potted singly in small pots as soon as they are moderately well rooted, using nice rich fibry peat in a small state with a large admixture of silver sand, and placing them till fairly established in their pots in a close rather moist pit. Beginners will, however, save time by procuring good strong young plants from the nursery. If obtained at once they should be placed in the warmest part of the greenhouse, and as near the glass as convenient. Water must be carefully administered to the soil during winter, giving just sufficient to preserve it in a healthy state, and the plants must be guarded against damp ; giving air on fine days, and avoiding wetting the foliage too much. If the plants are supposed to be at all pot-bound, examine the roots, and give a moderate-sized shift early in March, keeping rather close and moist after shifting and watering very carefully, until the roots get hold of the fresh soil.

During spring the plants should be placed in a pit or house where the night temperature may average from 40° to 45°, allowing it to rise 10° or 15° with sun-heat and a circulation of air, placing them near the glass, and affording them a nice moist atmosphere. Let the branches be nicely tied out, keeping the stronger shoots well down, and pinching out their points, in order to equalise the flow of the sap, and secure a compact close growth, but stopping should not be performed immediately before or after repotting. When growth fairly commences take every favourable opportunity of exposing the plants to air, avoiding cold drying currents, and moisten them overhead every fine afternoon, with a fine rosed syringe ; also give water more freely to the soil. Towards the middle of April remove the plants to a cold pit, which will be the best situation for them after fine weather sets in, and they will be found to grow much more freely here in summer than in a large or lofty house, where it is always difficult to maintain a moist state of the atmosphere. Should cold drying winds occur after removing the plants to a cold pit, or frame, give air very sparingly, raising the sash on the sheltered side, and use a thin shade to keep down the temperature, but give air freely on fine days, and secure a thoroughly moist atmosphere, by sprinkling the floor of the pit and the plants overhead early in the afternoon, shutting up for the evening, but giving a little air before retiring for the night. A thin shade should be used for a few hours on the forenoons of bright days, but beginners are apt to use this so as to induce thin weakly growth, and this should be avoided. As growth advances, attend to stopping any shoot which may be taking the lead of the others and keep them nicely tied out. If a second is wanted let this be given before the roots become pot-bound, and see to the ball being in a proper state as to moisture, as also the soil, for there is considerable risk in shifting pot-bound plants during the heat of summer, and still more if the ball or fresh soil is not in a properly moist state. Remove the plants to a light airy part of the greenhouse immediately damp cold weather occurs in autumn, and attend to them carefully with water, &c., in winter. If the shoots do not appear as if they would break strongly and make a close growth, cut them slightly back about the beginning of March, and place the plants in the warmest part of the house, keeping them near the glass, and draw the syringe lightly over them on the afternoons of fine days. As soon as they start into growth, examine the state of the roots, and if these are found to be in want of more pot room give a liberal shift and otherwise treat them during the summer as recommended for last season.

If the plants are intended for blooming the following season, however, they should not be stopped promiscuously till late in autumn, for this would probably cause them to bloom irregularly and sparingly, but they should rather be stopped all over about the middle of August so as to secure their breaking evenly, and having shoots of about equal strength before winter. And in this case they should occupy a cool airy part of the greenhouse until they can be removed to a cold frame or pit, or until after they have done flowering, for there will be nothing gained by exciting plants intended for flowering too early in spring. They should occupy a cool shady part of the greenhouse while in bloom, and after the beauty of the flowers is over cut the shoots back sufficiently to secure a bushy close growth ; also attend to shifting as may be necessary to afford sufficient space for the roots, and keep the specimens cool, affording them a moist atmosphere until they start into growth, and during the growing season. *Alpha.*

PROTECTION OF FORCING PITS AND PLANT FRAMES.

As many gardeners and amateurs will doubtless be obliged to find some substitute for their usual supply of Russia mats this year, a few remarks on the most economical mode of protecting these structures may not be without interest. The object for which protecting material of all kinds is used is vulgarly to keep out cold, philosophically to prevent the escape of heat, and hence that which with the least expenditure of money and time best secures the object in view must be the best to adopt. The market gardeners round London use principally long litter, and they prepare it through the summer by taking the longest straw from the dung as it is brought from the stables, and this where it is well shaken out and dried is formed into a stack contiguous to the frame ground, ready for its winter's use. This is simply thrown over the frames to the thickness of 4, 6, or 12 inches, according to the severity of the weather, and answers very well. But it is untidy for a gentleman's garden, and moreover makes the glass very dirty, depriving the plants of much light, and rendering a great loss of labour necessary in washing the frames ; and also much breakage. It is, however, very surprising how little attention some of the best market growers seem to pay to the importance of light ; you may go into their forcing grounds in the dark months of winter, when they are forcing Cucumbers and other early crops, but you might as well try to look through a 14-inch wall, as to discover the contents of the frames through the glass ; yet how astonishing is their success !

Wood shutters and thatched hurdles have been used since the days of Abercrombie ; but if they are durable they must be awkward and clumsy, and if they are not durable they become expensive. They have also another and still worse objection, which is, that if not very carefully handled they rub the paint off the sashes.

Mats, if they are good, so long as they remain in that condition are a very effective protection ; but thin, hard common mats, as too many of them have been of late years, are dear at any price. A really good mat, if held by the four corners, ought to hold water for a considerable time without its soaking through, but even the "best Archangel" mats of this description are few. Mats, however, are expensive, troublesome, and littery, and when shabby they are shabby indeed. The price of good mats will average about a guinea per dozen ; and supposing each mat to cover three square yards, that fixes the price at 7*d.* per yard, or, as double mats must be used, at 1*s.* 2*d.* per yard annually. Frigi Domo may be compared to a poor blanket ; it is a good non-conducting substance, but thin, and I fear not very durable —but still, I should think, as good as mats.

Now, it is an established fact that confined air is an excellent non-conductor, and hence a covering, to be really effective, should be as nearly as can be air-proof, and of course at the same time it will be water-proof. Hence, acting upon this hypothesis, some nine years back, I had water-proof covers prepared for all the pits and frames under my charge ; these were made of sail cloth, of which several qualities were offered by the dealers, but the best was procured from Henry and Co. of Mark Lane, being such as is used by the Admiralty for sails for our first class men-of-war vessels ; in width it was something less than a yard, and the expense at that time something like 1*s.* 3*d.* per yard. This was made up by a sail-maker into cloths of a size suitable for the pits to be covered, allowing six or nine inches to hang over at the back and front of the pits, and being elevated about two inches above the glass, and fastened tightly down, it became both air-tight and water-proof ; each cover was fastened at one end to a roller, and the other end was fastened to the frame of the pit, and at the time for covering up nothing more was necessary than to roll the cloth on and fasten it down by strong strings to staples back and front fixed for the purpose ; and hence, "Let the storm pelt us" or not, we could retire for the night certain that everything so protected was safe from frost. These covers, with a coat of boiled oil every alternate autumn, lasted for seven years, and I believe one of them at the present time forms the cover of one of Mr. Colyer's principal plant vans. Of course such a covering in the first outset will be more expensive than mats or other temporary appliances, but the first expense is the last for seven years, and consequently the saving is considerable. With proper care, and applied only to their legitimate purpose, I believe such covers would last several years longer than mine did, and perhaps with some preparation of gutta percha they might be rendered still more durable. But my covers were used for all kinds of purposes, such as shading seed-beds or cuttings in the open ground in the summer, protecting Strawberry beds when in fruit from drenching rain, sheltering plants in temporary frames, harvesting seeds, and sometimes protecting the hay-ricks in catching harvest weather ; and this last was the most destructive use of all, for the heat caused the oil to liquefy, and hence a good deal of it was lost.

For shading during the summer months thin straw mats made with tar-twine, or still better where they can be procured, reed mats, are very useful, as they may be made sufficiently thin to shade the plants without obstructing much light ; but possibly good screens, or Haythorn's hexagon netting, would be still less expensive, and certainly preferable, and more convenient for use.

For purposes of protection I look upon it to be of as much importance to have a waterproof covering as one capable of preventing the escape of heat ; for if on cold stormy nights, or in heavy falls of snow, it runs through the covering, and trickles down the glass, it is quite certain it cannot do so without abstracting a considerable portion of heat in its progress. I think a waterproof and air-tight substantial cloth, supported 2 inches above the glass, is as nearly perfect as can be ; and those who make the experiment will find (though expensive at the first) that in a few years they have avoided the general rule in such matters, viz., that of being "penny wise and pound foolish."

Where pits are heated sufficiently by hot water or flues, the expense of covering may be avoided ; but, in all cases of very severe weather, it will be found more advantageous to cover than to use much firing—not because of the expense of the fire, but to avoid the dryness of atmosphere, inevitable where a high internal

temperature has to be maintained at the same time that all the moisture contained in the atmosphere is being condensed upon the cold glass. All forcing houses would be best covered in severe weather, especially where it is indispensable to maintain a high moist temperature, and where fuel is dear, I think the expense of providing good waterproof covering would soon be covered by the saving in fuel.

It may not be out of place to give our great horticultural builders a hint which, if carried out, would offer considerable facilities to gardeners in large establishments, and that is in making a new garden to have the whole of the sashes of the same size, so that the sashes of a late might be placed over an early Peach house or Vinery, and thus form the best covering that could be had for such a purpose.

In the practical management of covering of course it is important in severe weather that cold pits and frames should be covered up before the glass becomes frozen and while there is yet some heat in the frame; in continued frosts such pits are better covered up than exposed in the daytime if the atmosphere is dry, and indeed with the cloth covers sufficient light is admitted for all plants in a state of hybernation for several weeks together, especially if care be taken afterwards not to expose the plants to strong sunlight, until they have been exposed to moderate light for some few days. *W. P. Ayres.*

Home Correspondence.

Brussels Sprouts from English Seed.—Permit me to correct an error which I observe in your columns of Saturday last. In the article "Vegetable Pathology," No. XLVII., paragraph 210, "M. J. B." says:—"The variety of Cabbage known under the name of Brussels Sprouts cannot be kept up by propagation from English seed; but not only is this a well-known fact, but there are only a few districts abroad where the seed can be produced in a state of purity." This subject I endeavoured to set at rest so long back as the year 1845. I then communicated to you my experience as to the possibility and certainty of producing this kind of Cabbage tree from English seed; I having, at that time, grown it from seed saved myself five years, and my father before me having done the same thing twenty years previously; I have now grown it nine years longer from seed of my own saving, making fourteen years in all during which I have had it under my own care, independent of my father's experience. In the *Gardeners' Chronicle* of April 12, 1845, you published my communication, and at that time I sent two specimens for your inspection; I now send you six specimens from the same stock of seed, taken as they come from one quarter of Brussels Sprouts growing at this place, and I flatter myself you will pronounce them perfect, as you did on the former occasion. There can be no deception in my case, for I never once purchased any Brussels Sprouts seed. At the time I wrote to you before on the subject you requested some seed; I sent you all I could spare, and if you could recollect the result of the produce and report the same, it would tend to correct an error into which many have fallen, and set the matter at rest for ever. I shall feel proud if "M. J. B." will pay my quarter of Brussels Sprouts a visit, when he will be better able to judge of the genuineness of specimens grown from English seed. I do not think that I have a "rogue" amongst them; I have had several run to seed in consequence of the dry summer, which has also been the case with Scotch Kale, sprouting Broccoli, and most of the brassica tribe this year, but that has nothing to do with the degeneracy of any of them. *Daniel Judd, Althorp Gardens, Northampton, November* 27. [The plants sent were as good as possible; and so were those raised in 1847, at Chiswick, from the seed he then sent. We have our own experience in confirmation; and there is no doubt that the opinion quoted in the Theory of Horticulture, to which "M. J. B." refers, was formed upon insufficient observation.]

Perilla nankinensis.—There is a quality possessed by this new Chinese annual which I have not seen noticed. I had imagined it to be allied to Mint, as perhaps it is; but its odour and taste, when strongly bruised, I find nearly resembles Cinnamon—so much so that I question if it is not deserving of a place among kitchen herbs. Do you think its use at all likely to be injurious? *O. P., Nov.* 28. [Certainly not.]

Pear-growing—Climates of London, Brussels, and St. Malo.—It is with much interest that I peruse M. de Jonghe's contributions to your journal, and I do not doubt that we shall obtain many valuable hints from so practical a man. But I beg your readers to note the difference of climate between Brussels and London, as appears from "Black's Atlas." I do not insert the winter quarter, as it has no reference to Pear growing. I should like to have added the climate of Jersey, but the tables only give St. Malo, which is close by.

S. B.

Gynerium argenteum.—During a recent visit to the family of an old and valued servant, near Devonport, I was shown a floral spike of this most beautiful Grass, which I was informed had recently been brought by a friend from South America. The recent inquiries made by the *Chronicle* as to its habitat induced me to put many questions to the possessor regarding it, which have elicited the following information, which I give in the writer's own words: "The Grass was cut by the steward of the Vixen steamer; she is on the Rio Janeiro station, and last summer was ordered down to Buenos Ayres, on the river de la Plata, where she anchored for some little time, and then went where a Government steamer never did before, 2000 miles up the river Parana, which it appears is a long but shallow and narrow river, which rises somewhere in the mountains of Brazil, and there he went on shore, and cut four pieces of Grass; one I had, two were given to another friend, and one to his mother. I have carefully shaken the flower-spikes, but no seeds have appeared, though there were plenty in the paper in which they came home, and which were burnt." The last portion of the information is most distressing to a horticulturist, especially as the seed would, I know, have been presented to me. *A Devonian.*

Forming an Orchard on Gravel.—I have had some experience of the effects of such a soil as "Beta's" on Apple and Pear trees; and I would recommend him to make the holes for the trees about 10 or 12 feet wide and 18 inches deep, and then to concrete the bottom well with lime and gravel about 6 inches deep; or if lime riddlings, such as are rejected by bricklayers, can be procured, they will answer equally well, taking care to water and ram them well, as the firmer the concrete is put together the more certain is the attainment of the object in view, viz., the preventing the roots from descending into the subsoil, which would cause canker. It is advisable to let the concrete stand a few days previously to planting the trees, in order that it may become dry and get thoroughly hardened. I would then advise your correspondent to procure the top spit of a good pasture, chopped well, and mix it with the natural light soil, where he intends planting the trees. The concrete having become quite hard, I would recommend him to proceed with planting, by filling the holes with the prepared soil, a little higher than the natural ground, say about eight or nine inches, then place the tree on the surface of the fresh earth, and having some finely chopped mould for the purpose, proceed to lay out the roots quite flat with the hand, taking care to fill in well between them with the finest soil, making all firm with the hand; then cover with about three inches of mould, but avoid treading on the roots, particularly if the soil should be surcharged with moisture. Afterwards put about four or five inches of good manure on the top, to protect the roots from severe frost, and prevent rapid evaporation from the soil, caused by dry March winds. *G. L. O. M.*

Galvanised Iron.—In the autumn of 1851 some tanks were made of this material for a Pine-house here. They were fitted up by a plumber from Northallerton, who was of opinion that water either hot or cold would not rust or injure this description of iron. On examining them a few days ago I found that they were crumbling fast to pieces, being rusted quite through in several places and leaking, and I am of opinion that this kind of iron is perfectly useless for the purpose. *John Hatherly, Gardener to W. Jackson, Esq., Scruton, near Northallerton.* [A specimen of the iron in question accompanied this communication, and quite confirms our correspondent's statement.]

Waite's Dan. O'Rourke Pea.—I quite agree with the writer of your Calendar that this is an invaluable early Pea. In January last I purchased 2 quarts of it, which I sowed on the 3d of February; on the 12th of April they were one mass of bloom; by the 1st of May I gathered pods fit for table, and by the 24th the forward pods were too old for use. I have been accustomed to consider the 24th of May early even for the first gathering, to say nothing of having them spoiling for want of using. The flavour of this Pea is excellent, the pods are large and full, and universally admired. *H. Arnold, late of Blendworth Park, Hants.*

Effects of Frost on Exotics.—List of plants seriously hurt, but not killed by the Winter and Spring of 1854, at Abbotsbury:—Piper excelsum, W. P.; Edwardsia grandiflora, Eurybia argophylla, Jasminum azoricum, W. P.; Kennedya monophylla, W.; Viburnum sp. Mexico, Buddlea salvifolia and salicifolia, W.; Rhododendron Dalhousiæ, P; Melia Azedarach, W.; Acacia Julibrissin, Myrica Faya, Standard Orange, P.; Menispermum laurifolium, Sapium ilicifolium, W. P.; Myoporum dulce, Eriostemon, sp., Clethra arborea, W.; Osteomeles ferruginea, Melosma, sp., W.; Cassia australis, W.; Ceanothus africanus, Laurus indica and fœtens, W.; Pittosporum salicinum, W.; Duranta Deppei, Habrothamnus, sp., Halleria lucida, Fuchsia corymbosa, W. P.; Mesembryanthemums, in gen. P.; Brugmansia sanguinea.—W., wall; P., protected, slightly in general; all the rest standard. *S.*

Vine Mildew.—I have read with interest Mr. Bennetts' remarks on this disease, at p. 679. The evil certainly did appear in the vinery he mentions in its very worst form, and spread with wonderful rapidity—attacking the foliage, young wood, and even the bunches, in a very short time. To cure it seemed a hopeless task; but I am happy to say that, by putting sulphur on the pipes, I did overtake and conquer it, although with some trouble, in consequence of my hot-water pipes being copper, which did not hold sufficient heat to evaporate the sulphur, as iron ones would have done. My Vines are now as healthy as they could possibly be, and are quite free from mildew. With the exception of a few marks on the Muscats, the berries have swelled and coloured quite to my satisfaction, and I am convinced that no one could trace on them the slightest signs of the mischief. The weight of my bunches has been stated to exceed 6 lbs.; but I beg to say that I have bunches heavier than that, although I had not cut any that weight when my case was mentioned in your paper. I feel perfectly satisfied that by the method of curing the evil mentioned by Mr. Bennett at p. 679, we may bid defiance to both mildew and red spider; for by adopting it, I have not only saved my Grapes, but I have secured good wood for another season. *J. W. Hall, gardener to J. Freeman, Esq., Gaines, near Worcester, Nov.* 20.

Viviparous Ferns.—Mr. Newman, at p. 120 of the last edition of his interesting "History of British Ferns," quotes Polystichum angulare, *var.* subtripinnatum, as the only known species that is viviparous. I have, therefore, much pleasure in announcing that I possess two forms of Scolopendrium (phyllitis) vulgare, Polystichum lobatum, Lastræa (Lophodium) fœnisecii, and Lastræa (Dryopteris) Filix Mas, all of which have either produced a viviparous plant, or are gradually developing bulbillæ. I could name other parties who have Ferns exhibiting the same phenomenon, but I do not feel warranted in bringing their names before the public. It is only fair to Mr. Newman to state that it was since the publication of his work that these singular instances of reproduction were observed, and further that it is questionable whether these deviations may become permanent. At a future period I hope to have occasion to resume this subject; meanwhile will you do me the favour to ask your correspondents to give their experience with respect to the success they have met with in raising hybrid Ferns. *Abraham Clapham, Scarbro', Nov.* 21.

Frigi Domo.—After two winters' experience of this material as a protection from frost, I have come to the conclusion that it is the best covering for pits and frames which ever came under my notice. It will keep out more frost than two mats, while it only costs the price of one; it is more tidy than loose litter, and fits more closely than straw hurdles, and it is much more manageable, for when fitted on to a roller end-ways, covering and uncovering can be effected in half the usual time, and there is no danger of breaking the glass. In wet weather it lies quite close to the glass, but as soon as frost sets in it becomes almost as tight as a drum, thus forming a space between it and the glass, a thing very desirable where the edges fit tightly, which they do. I believe that any greenhouse plant is perfectly safe under it until the thermometer indicates 10° of frost. *J. Rust, Broom House, Fulham.*

Foreign Correspondence.

Beurré Superfin Pear.—In the report of the exhibition of the Pomological Society, page 727, I observe a Pear is mentioned under the name of Beurré Superfin. This name was applied in 1846-'47, at Angers, to a seedling raised by the late Van Mons, which fruited for the first time in his nurseries at Louvain, in 1827, and was named in honour of His Royal Highness the Duke of Cumberland, who visited the grounds of our pomologist about that period. It is important that English amateurs and nurserymen should adopt the original name of this remarkable variety, which is thus condemned to an alias. In the gardens of some amateurs trees of this variety, 20 years old, are found under the name of Cumberland. It is impossible to mistake it on examining a tree somewhat grown up, without even seeing the fruit; for it bears a particular stamp which is not found in any other existing variety in cultivation. Its wood grows upright, and exhibits a vigorous pyramidal appearance, the shoots are very long, moderately thick, downy, streaked with greyish-green and a blackish colour. Buds triangular, pointed, deep brown shaded with black, flat at the base, diverging at the apex. The fruit is large, or very large, somewhat irregular, turbinate, pyriform; the skin is green, smooth, and shining, becoming somewhat yellow at maturity. The calyx is spreading, very regular, with stiff dark brown segments. The flesh is white, fine, melting; juice very abundant, sugary vinous, and agreeably perfumed. The seeds are large, oval, pointed, and of a chestnut colour. Season, end of September till beginning of November. It is surprising to us Belgians that none of the judges should have known how to distinguish this Pear among a thousand, and restore to it the original name of Cumberland. *De Jonghe, Brussels, November* 13.

Societies.

Linnean, *Nov.* 21.—The President in the chair. Dr. Iliff exhibited Baccharis genistelloides, and a species of Senecio from Peru, transmitted as pharmaceutical simples. Mr. B. Y. Brocas exhibited numerous specimens of leaf skeletons, prepared so as to represent, by portions of the leaf artificially preserved, delineations of natural objects, portraits, and other subjects. There were also exhibited and presented from the College Botanic Garden, Dublin, a cluster of the fruit of Sabal Blackburniana, and fruit of Hakea undulata, and Banksia prostrata; and from the garden of the Royal Dublin Society at Glasnevin, the beautiful vermilion fruits of Solanum ciliatum, and specimens of the fruits of Banksia marcescens, and other plants. Read, a continuation of "Observations on the structure of the seed, and the peculiar form of the embryo in the Clusiaceæ," by John Miers, Esq. Mr. Miers deduces from the analogy afforded by the seeds of the Garcinieæ, that the external covering of the seed in Clusieæ, on the nature of which doubts have been suggested by eminent botanists, is a true Arillus, and entered at some length on the grounds of this conclusion. "Although," he says, "it be true that the several envelopes of the seed in different families are not to be recognised alone by their consistency, which may be, contrary to general rule,

more or less membranaceous, ligneous, cellular, or composed of oily or resinous granules, according to circumstances, yet they may be determined by their relative position in regard to raphe, chalaza, diapyle, micropyle, hilum, &c., from which their true nature may always be inferred with greater certainty." In a note t this passage he observes that the want of precaution in attending to the nature of the nourishing vessels proceeding from the placenta, and penetrating the different integuments, has frequently led to misconception. These vessels present themselves in the shape of a raphe-like cord, under three very different aspects; (*a*), when the cord originating in the base of the cell loses itself, often at the opposite extremity, in the hilum of the contained seed; it is then properly the funicular cord, of which the common Cherry affords a good example; sometimes it is inappreciably short—in other cases, as in Magnolia, it forms a very long thread; (*b*), when these vessels, existing in the form of a thread, either free and exterior to the testa, or partially embedded in its sustance, spring from the point of attachment of the hilum of the testa, and extending along its surface, penetrate its substance at a spot called the diapyle, to unite with the chalaza of the inner integument, which is invariably opposite to the cotyledonary end of the embryo; this is the well-known raphe; (*c*), when the vessels passing from the hilum penetrate the inner integument, and extend in the shape of a thread beneath its surface in order to attain the radicular end of the embryo; in this case they constitute the suspensor, which has sometimes been mistaken for a raphe; it occurs in Tropæolum. The want of attention to the existence and position of the true raphe has often led to erroneous inferences in regard to the affinities of genera; and among the Clusiaceæ may be cited the instance of Calophyllum, in which the peculiar nature of these structures, added to other differences, serve to remove the genus from the Clusiaceæ, its position being probably in Lophiriaceæ, as was long ago suspected by Professor Lindley. Mr. Miers then entered into a minute and interesting investigation of the origin and mode of growth of the arilliform covering of seeds; and concluded the paper by summing up his views as follows:—"The facts I have brought together relative to the structure of the seeds in this family, must in a considerable degree change our views of the affinities of the Clusiaceæ They serve to bring the order into close proximity with the Rhizobolaceæ, a relationship founded upon analogies in the floral structure long ago pointed out by Cambessedes, but now rendered still more evident by the great similarity observed in their extraordinary embryonal development. In this last mentioned family, the embryo of its exalbuminous seed exhibits in like manner a gigantic radicle furnished with exceedingly minute cotyledons, with this difference however, that the cotyledons here are separated from the great body of the radicle by a slender free caulicle or neck. But if we imagine the suppression of this caulicular extension in the Rhizobolaceæ, and the close approximation of its minute cotyledons to its monstrous radicular mass, there would be little or no difference in the form of the embryo in the two families. At the same time that these circumstances tend to draw closer the affinities of the Clusiaceæ to the Hypericaceæ and Marcgraaviaceæ, they remove them to a considerable distance from the Terraströmiaceæ, with which order they have been hitherto considered to be most intimately related." The President announced that the third part of the 21st volume of the Society's Transactions was ready for distribution to the Fellows.

Notices of Books.

The Miniature Fruit Garden, or The Culture of Pyramidal Fruit Trees; with Instructions for Root Pruning, &c. By Thomas Rivers, of the Nurseries, Sawbridgeworth, Herts. Sixth edition, Longman & Co.

Those interested in dwarf fruit-tree culture will find that much useful and some new information, and many valuable instructions are comprised in the new edition of the 34 quarto pages of which the above work consists. The author, as is generally well known, has paid great attention to the subject, and has had the advantage of long and extensive experience, yet he himself says that with regard to keeping "our fruit trees in a nicely balanced state, we are all young and inexperienced." By this balance is to be understood the equality of the force of vegetation throughout the tree, so that one part may not become too strong whilst another is too weak; and so long as the means of preserving this balance is not known, or not duly attended to, the trees cannot be said to be properly managed. This principle should be kept in view, whether the trees are intended to occupy a large space or a small, like those that form the subject of the present work. The author's clear practical instructions are in accordance with this essential principle, and their adoption can therefore be satisfactorily recommended.

When the sap is regularly distributed, the tree is much more likely to come into a bearing state than when it flows very irregularly into the different parts, but notwithstanding good management in this respect, fruit trees are often inclined, in our climate, to grow to wood rather than to produce fruit. To counteract this tendency, the author proposed root-pruning some 15 years ago, and it has proved successful when judiciously performed, but his instructions as given in the work before us should be carefully studied, in order that the operation may not be improperly or unnecessarily performed. In this edition, the biennial removal of fruit trees without root-pruning is recommended, and is doubtless a good plan, not only for bringing the trees into early bearing, but also for preserving them from canker in bad or wet subsoils.

Besides directions for the planting and after-management of the Pear, Apple, Plum, and Cherry, subjected to dwarf training, lists are given of the varieties of these fruits most suitable for the purpose; and also the distances at which the trees should be planted under different circumstances of situation and modes of training.

The appendix contains an account and description of Mr. Ker's protected trellis for Peach and Nectarine trees, a report of the produce of which is given in the *Gardeners' Chronicle*, vol. for 1852, p. 614. The author now adds a description of the Peach trellis-house of Mr. White. It is of the following dimensions, and cost somewhere about 40 :—

Length	80 feet
Width (inside)	12 ,,
Height at back	8 ,,
Height at front	14 inches
Rafters (fixed 20 inches apart) ..	14 feet long
Trellis (15 inches from the glass) ...	13 feet wide
Sunken path in centre	2 feet deep

"The front and back plates both rest on Larch poles about 4 or 5 feet apart; a shutter 12 inches wide, on hinges, forms with a slip of board the front wall. The back wall is made with long fagots of brushwood—a double row; the ends are boarded up, and a door is at each end. Perhaps no gardening structure was ever built so cheaply, and none ever produced such marvellous effects. The trees, dwarf and standard trained Peaches and Nectarines, two to three years trained, 12 of the former and six of the latter, were planted in February, 1852; and this season (1854), only the third year of their growth, they have given 5000 Peaches and Nectarines. On one tree of the Noblesse Peach there were 500 Peaches, and the same number or more on a tree of the Ebrugne Nectarine. This seems enough to ruin the health of the trees, and so I thought when I heard of it; but when I saw the excessive vigour of the trees, I thought Mr. White and his gardener not so far wrong in allowing them to bear such an enormous crop. The dwarf trees have reached to the top of the trellis, and cover it so completely, that the standards must be removed this autumn.

"Mr. White was, I believe, offered the sum that the house cost him—somewhere about 40*l*.—for his crop of Peaches and Nectarines. The vigour of the trees is quite astonishing; the stems of some of them are 12 or more inches in circumference; they are planted inside the front shutter, and laid directly on the trellis. The remarkable success of this simple structure seems owing entirely to the perfection of its ventilation; the front shutter has been open night and day in warm weather, and the air passes gently and constantly through its brushwood back wall, so as entirely to prevent stagnation. The trees have been syringed regularly night and morning, and are in the finest possible health. As this brushwood wall is unsightly, and dangerous in some situations owing to its capability of harbouring rats and mice, we must now see what can be substituted for its perfect ventilating property. Hedges to lean-to houses, as I know from experience, are too cold to ripen Peaches and Nectarines, although highly favourable to the growth of the trees; it therefore appears to me that the perforated bricks, now largely manufactured, could be used with advantage in this way. The wall, 8 feet in height, should be built 5 feet from the ground with common bricks; and then 3 feet up to the top for the plate to rest on, with perforated bricks placed edgewise; in very cold weather in March, when the trees are in blossom, a curtain of calico, or any other convenient material, might be arranged so as to cover this space of the perforated wall at night, and in May it may be removed for the summer. This perforated space, with the front shutter constantly open, will, in my opinion, be perfect for a Peach trellis, and not unsightly."

Stanford's New Map of Sebastopol (Stanford, 6, Charing Cross,) is a remarkably clear plan of the ground of the siege operations and of the operations themselves, and is the best which we have yet seen. To all the detail included in the map issued by the Hydrographer's Office, is added the country itself as far as Tchorgoun, so as to include the scene of action at Balaklava on the 25th Oct., with the Turkish redoubts and the Russian advance. It is equally illustrative of the battle of Inkermann, extending far enough eastward to show the hills that were occupied by the Russian artillery, as well as the unintrenched gorge by which the Russians attempted to penetrate the English camp.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—The large Phalænopsis amabilis in the Orchid house is now in full bloom, which, indeed, it nearly always is; but at this season of the year, when flowers are comparatively scarce, its numerous beautiful large white blossoms are especially remarkable. Cattleya maxima, one of the handsomest of the genus, is also in flower. Both this and the Phalænopsis are growing on blocks suspended from the roof, and are thus seen to good advantage.

In the adjoining greenhouse the most striking plants at present are two examples of the Tropæolum Triomphe de Gand—one in a pot, the other trained up a rafter. Both are profusely clothed with large showy orange scarlet blossoms, which look as if they would keep in perfection for a long time to come. This variety of Tropæolum cannot be too well known; for it certainly ranks among the very gayest of our winter and spring flowering plants. Chorozema Lawrenceanum was also in full bloom, its brick red violet-tinged flowers producing a pleasing effect.

In the curvilinear stove, the plants now in blossom consist of the purple Justicia speciosa, Achimenes coccinea, one of the latest flowering of the genus, Manettia bicolor loaded with scarlet tubular flowers tipped with yellow, the lilac Ruellia isophylla, and the bright blue flowering Eranthemum pulchellum. By means of these and the pink flowered Balsam Impatiens latifolia, Epiphyllum truncatum, Geissomeria aurantiaca, Gesnera zebrina, the White Eranthemum, Aphelandra cristata, Begonia fuchsioides, and a Franciscea or two, a good display of floral beauty is at present maintained in this house, which also contains another glorious plant for flowering at this season, viz., Linum trigynum; the yellow blossoms of this plant are each quite as large as a half crown piece, and that they are produced in profusion will be best gleaned from the fact that on one small branch we counted no fewer than twelve, all expanded at one time. On the roof Passiflora fragrans, or Middletoniana, was in blossom.

In the Rose house the plants are still full of flower-buds, many of which are half blown, and they appear only to want a little sun to bring them out. Owing to the dampness of the house, mildew has begun to make its appearance, but it is kept in check by means of dusting the leaves with sulphur.

Several of the Cape and Scarlet Geraniums in the small greenhouse in front of the Rose house are even now in good bloom, and here, as in the larger greenhouse, were fine specimens of Tropæolum Triomphe de Gand. The yellow Coronilla glauca is also at present in blossom here, together with Statices, Chinese Primulas, and the variety of Mignonette called by the French grandiflora. It certainly appears to be more robust than Common Mignonette, which is said to flower a little earlier than this new continental kind. The winter blooming Selago distans was also coming into bloom in this house, which is always full of flower both winter and summer.

In the stove here, the large variety of Zygopetalum Mackaii was in flower, as were also Cymbidium giganteum, Maxillaria picta, and one or two other orchids, together with Begonias which we need not say are invaluable for winter decoration, Pentas carnea, the variety of Thunbergia called Fryeri, and the sweet smelling Franciscea latifolia which quite scented the air with its fragrance. The great mass of Begonias is, however, not yet in flower; they are coming on in a pit in which they have been all summer. Cinerarias, Chinese Primulas, Calceolarias, and Mignonette are also all at present in pits, growing on for the decoration of the shelves of the large conservatory.

The fine collection of Chrysanthemums which the society possesses is arranged along one side of the path all round the large conservatory, making a line on either side of the house 180 feet in length; it is at present in full bloom, and the plants being well grown and clothed with healthy foliage down to the pots, it makes as may well be conceived a grand display. The Pompones are perhaps those which will be the greatest favourites. Among these the best were Calliope, a finely-formed and very double lilac kind; Nitidum, white, with a yellow eye; Lais, purple, with yellow eye; Madame Lemichez, lilac, late and good; Aramis, deep purple, a fine kind; Tacitum, blush; Fenella, neat, small yellow; Drine Drine, a well-known pale yellow sort; Atropos, orange and brown; Louisa Miellez, white, with a yellow eye, fine in form; Circe, a very double lilac kind; Mignonette, yellow, with a buff outline; Liliputian King, dark brown; President Decaisne, purple, very full of petals and fine in form; Henrietta Lebois, like the last, but rather darker in colour; Graziella, lilac, with brown eye; and the Bride, a finely-shaped, small, white kind. The large-flowered sorts, though not very new, are also well worth inspection, as are likewise the Anemone kinds, which are favourites with some. These were all struck as late as the first week of July, and considering the time they have had to grow, they are wonderfully fine plants.

As regards the orchard-house a nice collection of fruit trees in pots has been obtained for it from Mr. Rivers, consisting of Peaches, Nectarines, and Apricots, 40 in all; and Messrs. Lee, of Hammersmith, have kindly presented the Society with 21 pots of Cherries, Plums, Nectarines, and Peaches. Among the latter is stated to be the Flat Peach of China, which has been lost sight of for years. The trees of it which the Society had before were killed by the severe winter of 1838, which is usually called Murphy's winter.

In the orchard department, pruning of Pear trees on walls has been commenced. The heads of old standard trees are also being thinned out, and the ground among the young espalier trees is being dug. The foliage of Peaches, owing to the late growth they made this year, is still quite green; but in general the wood is pretty well ripened, and in good condition for bearing a crop next year.

Of Lettuces, various sorts have been planted out on open borders, in order to test their comparative hardiness this winter; some are also under hand-glasses, and some under bell-glasses. Green and White Paris Cos now ready for use have been lifted and planted in the beds of old Melon-frames, under glass, where they can grow

free from frost, and be at hand whenever they may be wanted. Some Endive has also been put into frames in the same way.

Frigi Domo is now largely employed here as a protecting material instead of mats. All houses and pits to which it can be usefully applied are covered with it at night, and it is found to give entire satisfaction. It lasts longer than mats, is cheaper, and keeps out frost equally well.

FLORICULTURE.

Cross-breeding Calceolarias.—The leading sorts of Calceolarias of the last few seasons have been devoid of that shrubbiness and neatness of foliage which are so very desirable. If I am correct in my assertion, that the present race of Calceolarias is of too herbaceous a character, it is evident that no advance towards shrubbiness can be obtained by crossing the present florists' varieties amongst themselves; consequently recourse must be had to the strictly shrubby sorts. In support of this view, I will endeavour to give some idea of what the probable result would be of crossing the opposite kinds. In 1848 I obtained a few of the best Calceolarias which I could procure; these I crossed with Rugosa and others of a similar character; the seedlings from this union showed very shrubby habits, but the flowers, with one exception, were long, flat, and small; one variety which I saved was a decided advance on the old sorts in every property but size. The seed of 1849 gave a still further improvement: two plants produced flowers almost as round as a marble; another was almost as shrubby as Rugosa, with marks in the style of Lady Constable; another shrubby variety gave flowers nearly an inch in diameter; besides which, there were a dozen seedlings fully equal to the new Calceolarias that are annually inflicted on the public as superior selections. Though the whole of these seedlings are far from possessing the properties of a perfect Calceolaria, I feel confident, that as a whole, they comprehend the materials out of which a clever hybridist would soon produce something good; indeed I entertain so favourable an opinion of the capabilities of these plants, that, having no spare room in my greenhouse, I have presented them to a florist,—with the understanding that I should enjoy the pleasure of raising seed for him. I trust that I have said enough to induce a few amateurs to adopt my suggestions; as I feel satisfied that half a dozen persons leaving the present beaten path, and depending on some of the old (possibly new) shrubby varieties, to give them both form of flower and habit of plant, would in a few seasons elevate the Calceolaria to the rank of a real florists' flower. *A. Clapham.*

Cinerarias.—Is not your correspondent "W." mistaken in his measurement of his Cinerarias, which, he says, are from 3 to 4 feet in diameter? Does he not mean that much in circumference? I, too, grow Cinerarias. I have them now 28 inches in diameter, and many of my leaves are from 10 to 11 inches across; but I confess my inability to grow them 4 feet. Perhaps "W." will inform us whether he ties out his plants, which I do not; and whether, after cutting down his leading flower-stem, his blooms are as fine as they otherwise would be. *E. I. Edwards, Wells.*

Stoke Newington Chrysanthemum Society, Nov. 21.—On this occasion there was an excellent display both of plants and cut blooms, and altogether the show was quite equal, if not superior, to those of former years. The six plants exhibited by Mr. Gitkins, gr. to P. Johnson, Esq., which took the first prize, a silver cup, were admirably grown specimens and beautifully flowered, the blooms being of good quality. The varieties were, Mount Etna, Queen of England, Annie Salter (which was the specimen plant of the entire exhibition), Christine, Defiance, a huge specimen, and Madame Camerson, a plant not less than 5 feet in diameter. Mr. W. Holmes, of Hackney, was second, with Defiance, Pilot, Chevalier Dumage, rich golden yellow; Mount Etna, a splendid plant; Christine, full 6 feet in diameter; Annie Salter, profusely flowered. A third collection was contributed by Mr. James. For six Pompones, Mr. Scruby was first, with Madame Rousselon, delicate rosy peach colour; Cedo Nulli, Drine Drine, Model, Autumnum, and Dame Blanche, yellow with white. These were all well-grown specimens. The second prize was awarded to Mr. Goodenough, for Cedo Nulli, Solfaterre, Ninon, Model, Autumnum, and Surprise; other collections were also staged in this class. Cut flowers, nine collections of 24 blooms, were staged for competition. The first prize, a silver cup, was awarded to Mr. G. Taylor, of Hackney, for a stand of very fine blooms, consisting of Queen of England, Campestroni, Themis, Nonpareil, Beauty, Madame Audry, Defiance, Aregina, Duke, Rolla (rosy purple and good), Two-coloured Incurved, Rosa mystica, Plutus (beautiful), Racine, Formosum, Cyclops, Dupont de l'Eure (symmetry itself), and Trilby (a new blush variety); second, Mr. A. Wortley, whose stand contained a beautiful bloom of Golden Cluster, and Versailles Defiance (a beautiful incurved rosy purple), and Pio Nono (a good flower); third, Mr. G. Hutton, who had in his stand fine blooms of Racine (deep yellow, with small purple tip on the under side of the petal) and Nonpareil (a good deep lilac flower); fourth, Mr. R. James, who sent a fine bloom of Themis (a noble back row flower), Arc en Ciel (also good), Christopher Columb (deep chestnut, with gold tip, distinct and good), Miss Kate (pale lilac, a small flower, but smooth); fifth, Mr. Scruby, who had good blooms of Plutus, Annie Salter, and Racine (a flower always difficult to obtain good); sixth, Mr. E. Sanderson, in whose collection we noticed Goliath, good blooms of Leon Lequay (shaded lilac, a stout incurved flower, with a light centre), and Aristides (dull orange, margined with red). In 12 blooms the first prize, a silver cup, was awarded to Mr. G. Hutton, of Shacklewell, for Campestroni, Defiance, very good, Themis, Aregina, deep rosy purple, stout and bold; Queen of England, Strafford, delicate peach, and globular, Formosum, Nonpareil, Dupont de l'Eure, Gem, Rosa mystica, and Plutus; second, Mr. E. Sanderson, who had a fine bloom of Themis and Beauty, and Leon Lequay, again very fine. Other collections were also exhibited. In six blooms, Mr. E. Sanderson was first, with Leon Lequay, Themis, Queen of England, Rosa mystica, Gem, and Plutus, a noble pyramid. Some other collections were staged in this class. Seven collections of six Anemone-flowered varieties were exhibited. Mr. Taylor was first, with Fleur de Marie, Marguerite d'Anjou, Madame Godereau, Marguerite de York (a lemon-coloured Gluck), and Nancy de Sermet. Mr. R. James was second, with good blooms of Gluck, Fleur de Marie, Marguerite de York, Madonna, Sulphureum, Pallidum, and Madame Godereau. Mr. Scruby was third, having in his stand a fine bloom of Marguerite d'Anjou, and a well proportioned Gluck. Other collections were also exhibited. In the maiden class, for six blooms, for those having never previously taken a prize, four collections were staged. The first prize was awarded to Mr. J. Stapleton, of Stamford Hill, for Themis, Queen of England, Beauty, Rosa mystica, Nonpareil and Dupont de l'Eure.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Some of the earliest Chrysanthemums will be past their best, and should be replaced with others from the retarded lot. Give those in bloom plenty of clear manure water, which will assist in preserving the foliage in health, and increasing the size of the flowers. While the principal collection is in flower, a careful selection of the best and most useful sorts should be made; for, although we have had many fine varieties introduced within the last few years, we have also had many others that are comparatively worthless; and it is better to grow duplicates of really good sorts than to keep indifferent kinds merely for the sake of having a long list of names. Cinerarias are excellent subjects for the conservatory, provided they can be placed near the glass, and kept free from insects. These will require a little artificial warmth to bring them into flower at this season; but the temperature should not exceed 50° at night, and air must be admitted rather freely every fine day; otherwise the plants will become very weakly and be a prey to insects. Also encourage the late Primulas with a gentle warmth and a moist atmosphere. See to maintaining a regular and as plentiful a succession of Camellias of the various colours as circumstances will admit; for these are, without exception, our most showy and useful winter flowering plants.

FORCING DEPARTMENT.

Pineries.—The plants expected to show fruit early next year will be greatly benefited by being kept in a comparatively dry state for a few weeks previous to subjecting them to a warm moist temperature. The atmosphere should be kept dry, also allowing the soil about the roots to become as dry as can be done with safety; do not, however, subject the plants to a very low temperature, but keep this at from 60° to 65° by means of fire heat, for although the plants will bear a considerably lower temperature without any apparent injury, those not subjected to any unnecessary extremes will produce the finest fruit; and a short period of comparatively dry treatment will ripen the growth, and just as effectually induce a tendency to show fruit as checking the energies of the plants by an unnaturally low temperature, and without any of the ill effects of the latter method. No dependence can be placed on the weather at this season, therefore see to plants in pits with insufficient means of heating, being well protected by means of covering at night, and maintain the command of a rather high temperature by frequently renewing the linings, &c., so as to be prepared for any sudden decrease of the external temperature; avoid anything approaching excess of atmospheric moisture among young stock, whether in pits heated by linings, or in better arranged structures, which only tends to promote a too free rate of growth for the amount of light, and weakly blanched foliage is the result. Peaches.—These cannot be subjected to anything like hard forcing without the trees, if not the present crop, being seriously injured, and those who wish to have ripe fruit early next May cannot commence forcing too early, for although a good crop may be secured in a considerably shorter period, it will be at the expense of seriously injuring the trees. Let the temperature for the first month be kept at about 40° at night and 50° by day with fire-heat; and directions as to moisture, &c., as given previously will be quite applicable here. Also embrace the first convenient opportunity for pruning, painting, and retieing the trees in the late-house, and cleaning the paint, &c., if not already done. Late Vineries and Peach-houses are generally used for storing plants in winter, but after cleaning the houses care should be observed not to place in them plants infested with black thrips, or any other troublesome insects.

FLOWER GARDEN AND SHRUBBERIES.

Except where alterations are in hand, there will be little here requiring attention at present, except the clearing up of leaves and putting the borders, &c., into neat order for the winter. Get this done, however, with as little delay as possible, in order that the place may be as enjoyable as the season will admit. Also roll the gravel walks and lawns frequently, and keep these firm and smooth; for, without good dry firm walks, pleasure-ground is next to useless at this season. The present is an excellent time for applying strong liquid manure to Roses. It is astonishing how vigorous even the weaker-growing varieties will become if treated with a liberal allowance of strong liquid manure, made with night-soil, and applied annually at about this season. This may be used again in spring, diluting it to about the consistency of thin paint, and giving each plant from 2 to 3 gallons. A portion of the surface soil should be removed, and the ground stirred as deeply as can be done without injuring the stronger roots, replacing the surface soil after the manure-water has soaked into the ground. The tender sorts, as Teas, should have a coating of Moss placed round their stems, and also over their roots, before severe weather sets in, which, in the event of our experiencing such a winter as the last, will preserve the roots from injury; and if the plants should be killed to the ground, they will push vigorously from the stems, and form nice bushes next season. But perhaps the best way of wintering the tenderer varieties of Roses in unfavourable localities is to lift them every season, and place them on the north side of a wall, under the shelter of a canvas frame or screen. Managed in this way, they will resist a severe winter unhurt, and, with a little attention after replanting in spring, they will hardly feel the shift.

HARDY FRUIT AND KITCHEN GARDEN.

It is desirable to get all vacant ground turned up as early in winter as it can be accomplished, if only for the sake of the clean fresh appearance which it then presents. Therefore take every opportunity of forwarding this work, and get Currant and Gooseberry trees pruned; also prune and tie Raspberry plants, in order that the ground occupied by these may also be ready for digging. Where caterpillars are annually troublesome, a good dressing of quicklime applied before digging the ground will be of service in preventing the attacks of these pests. Some experienced growers assert that two applications of quicklime — the one applied before digging the ground in winter, and the other just before the leaves appear in spring, slightly stirring the surface of the ground with an iron rake to cover it—will entirely prevent the appearance of caterpillars, and the practice is at least well worth the trifling expense it involves. The Raspberry buds are frequently destroyed by a red coloured small insect, which secretes itself in the young shoot and eats out the heart of the bud. A good dressing of gaslime placed round about the roots of the plants now, and repeated again in spring, will save any farther trouble from this enemy.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Nov. 30, 1854, as observed at the Horticultural Gardens.

Nov.	Moon's Age.	Barometer.		Temperature. Of the Air.			Of the Earth		Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean	1 foot deep.	2 feet deep.		
Friday 24	4	29.266	29.186	42	30	36.0	44	45	N.E.	.60

Satur. 9	46.0	35.9	40.9	13	0.31	2	6	2	1	1	11	4	1

The highest temperature during the above period occurred on the 8th, 1843—therm. 58 deg.; and the lowest on the 5th and 6th, 1844—therm. 14 deg.

Notices to Correspondents.

Blight: *W H.* Your Acacia armata is overrun with the scale insect, and it is likely to ruin your whole house. All you can do now that the plant has got into this terrible state, is to wash it carefully with hot water, at 150°, and to repeat the operation whenever the insect reappears. If you don't value your Acacia you had better burn it, the earth in which it grows, and the pot in which it stands.

Emigration: *N O P.* Go to Canada. Take nothing with you except a good heart and what money you have. Tools and all such things abound there, and it does not pay to speculate in them. Speculate not at all, but rely upon the sure though slow profits of industry and intelligence. Read Hutton's "Emigrants' Guide to Canada."

M'Glashan's Tree Lifter: *T G P.* It is necessary to communicate with Mr. M'Glashan, Edinburgh. He intends, we believe, again to exhibit the action of his machine next week in the Gardens of the Horticultural Society, for which he has received permission.

Names of Fruits: *W A E.* Your Pear is Beurré Diel.—*B R Cant.* Your seedling Pear is very good, but much resembles the Beurré d'Aremberg.—*W M T.* 1, 2, Passe Colmar: 3, Beurré Diel.‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*G B.* We have failed in the attempt to ascertain the name of the fragments you have favoured us with.—*J. Bruce.* Gongora fulva.

Nassau: *J C L.* The seeds of Casuarina equisetifolia arrived this morning. Those of Chamærops are in London, but have not yet been delivered. We will write as soon as we get them.

Protection: *J F.* We did not collect your meaning from your previous note. Since you want not only shelter but light you must be satisfied with glass sashes of the common kind. Varnished calico, and similar contrivances are cheap enough, but they so soon perish that glass is least expensive in the long run.

Veronica: *L P & Co.* Your V. Kermesina is a handsome dark variety of V. speciosa. Its beautiful large spikes of deep purplish crimson blossoms cannot fail to make it a favourite.‡

Misc.: *West Countryman.* Both the plants you mention may doubtless be had of any of the great London nurserymen. We never recommend dealers. ‡

⁂ As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

SUPERPHOSPHATE COMPOST COMPANY.—427, Strand, London.

The Directors having received numerous applications for Winter Wheat Manure, have the pleasure to notify to their Friends and the Agriculturists generally, that they have 1000 tons expressly prepared for drilling with Winter Wheat, and now ready for delivery at 7*l.* per ton net cash, that is, payment in one month. Carriage free to any Railway Station or Wharf in London. Further particulars may be obtained of the Agents.

W. W. WATSON, Secretary.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.

WM. INGLIS CABNE, 10, Mark Lane, London.

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6*l.* per ton, free to Railway.

They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.

Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.

Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

LAND DRAINAGE.

MR. BAILEY DENTON'S TABLES OF COST, &c., price 1*s.* 4*d.* Sold by METCHIM, Parliament Street.

MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1*l.* 10*s.* Sold by JONES & Co., High Holborn, London.

JOHN MORREN, GENERAL COMMISSION AGENT, Ock Street, Abingdon, is open for Commissions for the sale of Agricultural Implements, Manures, Seeds, &c., and for the purchase of Corn, &c.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.

BURGESS AND KEY,

103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.

103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.

103, Newgate Street, London.

IMPORTANT TO AGRICULTURISTS.

BOYDELL'S PATENT APPARATUS OR ENDLESS RAILWAY will effect a saving of Two Horses out of Three, in carrying out Manure, and all produce of the Farm home, as well as the damage done to wet fields by carrying heavy loads over them in bad weather.

A Cart with the Railway attached may be seen at Boydell and Glasier's, Camden Works, Hawley Crescent, Camden Town, near the Canal Bridge, London. The Invention will be exhibited, and its capabilities explained and proved, by drawing loads by weights over a pulley, at these works, between the hours of 10 and 4 o'clock, on the days of the Prize Cattle Show, viz., the 5th, 6th, 7th, and 8th of December; and each succeeding Monday. At these Exhibitions it will be shown, that a cart carrying 2 tons with the Patent Apparatus attached, can be drawn over ground by 1 cwt. and 3 qrs. over a pulley; and that on the same ground a cart precisely similar, without the apparatus, with the same load transferred from the other cart, will require 5½ cwt. to draw it.

The value of the invention will also be shown in going over obstructions, as well as in the saving of the wear and tear of the wheels, and its applicability to using it for drawing ploughs by steam-power, proved and explained,

Endless Railways for carts will be supplied and attached to any wheels, provided by the owner (but light new ones are recommended), and sent to Camden Works, upon the following terms, viz.:—

To Wheels to carry 2 tons £7 10 0
Ditto ditto 3 tons 10 0 0

Patentee's charge for the use of them, 5*l.* per pair for the term of the Patent, or 20*s.* per annum. If wheels exceed 4 feet 6 inches, an extra charge,

The attention of Agriculturists is also called to Boydell and Glasier's Patent Hurdles, Portable Conservatories, Patent Ventilating Hand Glasses, Iron Buildings, &c., which may be seen at the Works.

THE LINCOLN SHOW.

FIRST PRIZE.

ROOT PULPING MACHINE.—Invented and Patented by FREDERICK PHILLIPS, of the Hall Farm, near Brandon, Suffolk. The object of these Machines is to introduce a more profitable Mode of Feeding Fattening Animals, by giving them Roots and dry food mixed together, instead of the old system of feeding them at one meal with cold sloppy roots, and at another with compact farinaceous or oleaginous food. Their peculiar advantage is that they so effectually pulp or mince down Turnips or other Roots that animals cannot pick them out from any dry meal or chaff they may be mixed with. Animals by this mode improve faster, and at less expense, than by the old system of feeding. It is also an economical method of keeping lean stock, whether the Flock, the Herd, or Horses, as they may be made to eat with a relish Straw, Chaff, or indifferent Hay Chaff, by mixing a portion of minced Roots with them. These Machines have been greatly simplified, improved, and reduced in price, by the Patentee, since they were exhibited at the Lincoln Show. They will be Exhibited at the coming Cattle Show of the Smithfield Club—Stand 236.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

INCORPORATED BY SPECIAL ACT OF PARLIAMENT.

Offices, 52, Parliament Street, London.

DIRECTORS.

HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

John C. Cobbold, Esq., M.P. | William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S. | Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq. | Samuel Morton Peto, Esq., M.P.
Thomas Edward Dicey, Esq. | William Tite, Esq., F.R.S.
William Wilshere, Esq.

Empowered to execute, or to assist Landowners in executing with their own Capital, works of Land Improvement, viz., Drainage, Irrigation, Road-making, Enclosing, Reclaiming, and the Erection of Farm Buildings upon any Estates, under Settlement, Mortgage, or Disability, and without any investigation of Title, to charge the total amount of the outlay and expenses upon the property improved, to be repaid by annual instalments, varying according to the number of years over which Landowners may determine the repayment shall extend.

WILLIAM CLIFFORD, Secretary.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

BAKER STREET BAZAAR.

SUTTON'S LINCOLNSHIRE RED GLOBE TURNIP.—This Turnip has endured the drought better, and produced heavier crops than any other. Messrs. Sutton having grown a fine crop of Seed of this popular sort will take orders at the Baker Street Show for new Seed, at 1*s.* per pound, being desirous of charging very moderately *while they have a large Stock of Seed.*

STAND 278.

SUTTON AND SONS, Seed Growers, Reading.

PRIZE CATTLE SHOW of the SMITHFIELD CLUB.—The Annual Exhibition of Prize Cattle, Seeds, Roots, Implements, &c., will open to the public on Tuesday Morning, and closes on Friday Evening, 5th, 6th, 7th, and 8th of December, Bazaar, King Street, Baker Street. Open from daylight till nine in the evening. Admittance, One Shilling.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 12th, 13th, 14th, and 15th of December next.

The PRIVATE VIEW and ANNUAL DINNER on TUESDAY, December 12.

There will be SPECIAL TRAINS on all the principal RAILWAYS, full particulars of which will be announced in the Advertisements and Bills of the several Companies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The December GENERAL MEETING will be held at the Society's House, in Hanover Square, on SATURDAY, the 9th December, at Eleven o'clock in the Forenoon.—By order of the Council,

JAMES HUDSON, Secretary.

The Agricultural Gazette.

SATURDAY, DECEMBER 2, 1854.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Dec. 5 { The Farmers' Club. Show of the Smithfield Club.
WEDNESDAY, — 6—Agricultural Society of England.
THURSDAY, — 7—Agricultural Imp. Society of Ireland.

COVENEY'S "ECONOMICAL MANURE."

IT will be in the remembrance of our readers that we some months since published extracts from the "Cyclopædia of Agriculture," and the "Journal of the Agricultural Improvement Society of Ireland," giving analyses, by Dr. VOELCKER, Professor APJOHN, and Mr. NESBIT, of the so-called PATENT ECONOMICAL MANURE, which had been during the past year largely advertised throughout the country, and had obtained in many places a certain amount of sale. The purport of these analyses was brought before our readers in two or three leading articles, in which their bearing on the real worth of the substance was pointed out. As to its market value, we shewed that the materials of which the so-called economical manure is manufactured,—for which Mr. COVENEY asks 12*l.* per ton—could be purchased for less than 4*s.* a cwt.; and as to its agricultural effect, we published a letter from a correspondent expressing the hope that the exposure we had given of its worthlessness would have sufficient weight to caution people from using it. This letter stated that the writer had employed the manure on four different crops, and had applied it to each in different ways, and in no case with the least benefit, so that, from his placing confidence in the testimonials written in its favour he had entirely lost his Turnip crop. Such a statement was to be depended on; and it described an experience which tallied with the chemists' account of the stuff employed.

For the publication of our correspondent's letter, we received some weeks ago (in fact on the very day of its appearance, Sept. 9), notice of an action for damages on account of the libel which it was alleged that it contained,—so that Mr. COVENEY and his solicitors must have been watching us in the hope that in our exposure of their proceedings we might legally trip. And if the sale of an article yielding at least 200 per cent. of profit to its fortunate manufacturer and salesman was thereby injured, no doubt damages would have been laid at a good round sum. That no jury would have awarded them, however, we felt satisfied; and that Mr. COVENEY thinks the same would appear from his having failed to avail himself of the opportunities which have since arisen for carrying the affair further. We have heard no more of his action. Damaged characters, juries are apt to consider, cannot *wait* for a justification: Mr. COVENEY'S patent "economical" manure has lost one term—*ergo*——

Our correspondent, speaking of the "economical" manure, stated that he was desirous of adding his "testimony to the truth of its worthlessness." Now the fact is, that, while numberless cases may be adduced in which the stuff has done no good, and in which indeed it has been mischievous, still the thing *is* worth a certain sum per ton; and if a jury of philologists and lexicographers were empannelled, their verdict might declare that we had not justified the libel of which it was alleged that we were guilty; but "worthlessness," in the mouth of a farmer, does not convey exactly the idea which Dr. JOHNSON attached to it:—and if an agricultural jury be empannelled—or a jury of chemists—or a jury of manure manufacturers—or a special jury selected in the ordinary way—we venture to believe that they will not consider "worthlessness" too strong a term to use in reference to a mixture made up of green vitriol, plaster of Paris, common salt, Glauber's salts, &c.—in reference to a so-called "economical" manure, of whose failure evidence in every county to which we have written on the subject will be forthcoming if Mr. COVENEY likes to go into court—in reference to a compound for which materials may be purchased for less than 4*l.*, although its manufacturer has the face to ask three times that sum. It may not be literally worthless, for it is worth, *though not to the agriculturist*, 3*l.* or 4*l.* per ton; but it is worthless in the same sense in which a character is worthless which when it is assailed is not thought worth defence.

We were delighted to receive notice of the action, for we felt that an opportunity would thus be given us of proving either that the agricultural community had been grossly victimised, or that we had been erroneously informed, and were unjustly prejudicing an article—the product of Mr. COVENEY'S honest enterprise and skill. This opportunity, however, it appears we are to wait for. Be it so; our character is not at stake, it is only the manure's. The threat of an impending action will not, however, deter us from publishing whatever evidence we please on this subject. We have abundance already in our hands to justify all that has been said.

Mr. COVENEY has advertised that the testimonials for 1854, to the value of the "economical" manure, are of the most favourable character. Out of every thousand doses of any quack medicine there will be 990 cases of its failure of which no report is given by the invalids; and yet if its manufacturer would only faithfully report *all* the testimony which reaches him, the public would not be misled, for the righteous indignation of nine would overbalance the ignorant gratitude of one. Let Mr. COVENEY publish *all* the evidence which has reached him on this subject, and we might risk our case upon his own presentment of it. Perhaps he will tell us how many actions he has been obliged to threaten, in order to get payment for his drug from poor farmers; or how many of his agents, being people of high character, have, on finding out its true value, thrown up their agency. Should he have no list and like to go into court, we will summon some of them with pleasure.

THE agricultural mind is now becoming alive to the fact, that task the powers of cultivation and of the soil as we may, we are likely to be wholly unable to keep up with the demands made upon them by our rapidly increasing population; a population, too, whose powers of consumption are increasing even in a greater ratio than its numbers, so that it exhibits day by day an increasing desire to revel in beef and mutton, and good wheaten bread,

and will not be satisfied with the scanty and coarse fare on which in bygone times it used to exist.

This is a cheering prospect. It shows a gradually widening circle, within which material comforts are more common than they used to be; and it is the strongest evidence of the healthful advance of the country in material prosperity. We say healthful, because our prosperity is not like that of some ancient and even modern nations of which we read; where the prosperity of one class meant the degradation of another, where the social scale remained in its wonted position, with the distinctive classes which it marked crowded together at either end, the highest luxury at the one separated by a wide blank from squalid misery at the other. Here we have the happier spectacle of a general upraising of the whole scale; the zero of yesterday is no longer the zero of to-day; but all partake in the general improvement.

These reflections, based as they are upon statistical data of the most undeniable description, combined with the well-known fact of the increasing demand for food over all the world, may well satisfy all those connected with the cultivation of the soil that they will have no lack of customers, that they need not throw away their ploughshares under the vain impression that the produce of their acres will no longer fetch a remunerative price; their difficulty will rather be, we apprehend, to produce enough to satisfy the craving appetites around them, or to ward off from these islands the evils of a short supply, amounting, it may be, at times to something little short of famine.

Within these few weeks it has become almost a trite saying that, inasmuch as we cannot increase our acres, we must try what we can do to increase their productiveness. Now this is the process which we wish to stimulate and encourage. There is neither logic nor policy in quarrelling with our neighbour because he tells us that he grows more Turnips or hay than we have done: let us rather patiently investigate the matter, and endeavour to find out how it was accomplished, and try to copy the example. It has long been the fashion to apologise for the backward state of the cultivation of a district by laying the blame on embarrassed landlords, whose powers of making those primary and essential improvements necessary under a system of high farming are paralysed by burdens on their estates, created by their own or their ancestors' extravagance. This has been the excuse; but it ought no longer to pass current; for it does mischief, by allowing people to think they have done all they could do, or rather that they are powerless to make improvements, and so to neglect their duty and excuse themselves, on grounds which have no existence. No owner of landed property, be he tenant for life only, owner in tail or fee, no matter though his property be mortgaged, can now plead any excuse for not improving it short of the legitimate one—if he can prove it—that it will not pay to do so.

We have long had the Government Drainage Acts in force, by which money might be borrowed for drainage, and for trenching and fencing and otherwise improving waste or uncultivated land, at a rate of interest far below what the borrower could have obtained it for, even under the most favourable circumstances. Now, we have in full operation several companies (and amongst them one whose act may justly be styled a well devised and efficient scheme) for advancing money under the sanction of the inclosure commissioners for drainage, irrigation, building, machinery, and other improvements on land.

The company to which we now more particularly refer is called the "Lands' Improvement Company." It proceeds on a totally different principle from the other companies previously established, in so far as it advances the money at a reasonable rate of interest, leaving it to the borrower to arrange his improvements, by means of his own architect, and engineers or surveyors, controlled by the inspection of the inclosure commissioners. We think this company calculated to do great good; we shall therefore return to the subject, and give some account of its mode of procedure, which we know will prove acceptable to a large class of our readers.

ON THE AMOUNTS OF, AND METHODS OF ESTIMATING, AMMONIA AND NITRIC ACID IN RAIN-WATER.—By J. B. Lawes, Esq., F.R.S., and Dr. J. H. Gilbert, F.C.S.

(British Association, Liverpool, 1854.)

(Section B: *Read* Monday, September 25.) — *Abstract.*—We were indebted to Cavendish for the observation that ammonia and nitric acid were formed when humid air was submitted to voltaic action. About the commencement of the present century, De Saussure detected ammonia in the atmosphere; a few years later Chevreul observed its presence in the Seine; and in 1825 Brande detected it in rain-water. Since that time much more minute attention has been paid to this subject, and also to the presence of nitric acid in meteoric and other waters. Liebig and Boussingault have particularly called attention to the influence which the ammonia carried down from the atmosphere must have upon the growth of plants; and the former of these philosophers pointed out the occurrence of nitric acid also in a considerable number of rain-waters which he examined, especially those of thunder-storms. Dr. H. Bence Jones has also found nitric acid in rain which fell in various parts of England, and in the south of Ireland. But it is to the more recent labours of Boussingault that we are indebted for our most elaborate quantitative estimations of the ammonia in rain, and other waters; and M. Barral has made a series of quantitative determinations of both the nitric acid and the ammonia contained in the rain-water which fell at Paris during several consecutive months in 1851. It was chiefly with a view to the agricultural bearings of the subject that the authors had entered upon the same field of investigation. But the object of the present paper was rather to discuss the methods of analysis than to rely with confidence on the conclusions to which we might be led by the more direct application of the results yet obtained to the solution of the several important scientific and practical questions upon which they bore. Tables were exhibited, showing the experimental results obtained in the estimation of ammonia in rain-water by several different methods. In the first instance, very large amounts (from 100 to 200 pounds or more) of rain-water, to which a little caustic potass was previously added, had been distilled; and the distillation of the product repeated—collecting in each case about one half the amount put into the retort—until the whole was reduced to a convenient bulk for further concentration in an open vessel. This was then evaporated with a known amount of sulphuric acid to a given volume; and measured portions of this final product were then neutralised by a standard alkaline solution, in the usual manner of liquid analysis. This method the authors conceived gave very good results; but it had been abandoned from the great practical inconvenience, and frequent breakage, in conducting distillations in glass on so large a scale. They had next adopted a method substantially the same as that of M. Boussingault, which was to submit to a single distillation, generally not more than one litre (about 35 ounces) of water; two or more successive tenths or fifths of the product being then, with certain precautions, tested for ammonia by the liquid method. In this manner exceedingly minute actual amounts of ammonia could be determined; and by a careful and constantly practised hand very valuable comparative results might be obtained. It happened, however, that, in relation to the average total amount of ammonia contained in a litre of rain or other waters, the minimum error was frequently not less, and sometimes considerably more, than 4 or 5 per cent. of such total amount. The authors had therefore, in their more recent experiments, operated upon several litres of water in the first instance, reducing it by successive distillations to one half, until thus brought to a convenient amount for final distillation, and subsequent testing of measured proportional amounts of the product, according to Boussingault's method. This modification, which the authors found M. Boussingault had himself suggested, but apparently not generally adopted, was considered to be important, and to be more applicable to this delicate subject of enquiry than either of the other methods which had been attempted. However, some results obtained by the first method of large distillation, by the side of others of the same waters, by Boussingault's plan of small single distillations, showed considerable coincidence; such as to give confidence in the general principle of the methods. The average of the determinations made on monthly mixed samples of the rain which fell at Rothamsted, during more than a year, gave about one part of ammonia per million of rain-water; the average of many determinations made by Boussingault at Liebfrauenberg in Alsace, was about 4-5ths of this amount; whilst the estimations, both of M. Barral and M. Boussingault, at Paris, gave as much as three or four parts, or even more, of ammonia, per million of rain water. It was interesting too, to notice, that the variations in the amount of ammonia which the authors had obtained in the rain of different but entire months, when considered in connection with the registered amounts of the fall, the direction of the wind, and the general character of the weather, were perfectly consistent in kind with the results of M. Boussingault in his special examinations of rain falling, under different circumstances, of the water of dews, of fogs, &c. The process adopted by the authors for determining the nitric acid was to evaporate the rain-water with an alkaline carbonate several times to dryness, to weigh the solid residue, and determine its per centage of nitrogen by Dumas' direct volume method of combustion with oxide of copper. With some of the results thus obtained, however, they were not satisfied; and they considered an accurate method for the determination of small quantities of nitrogen, or rather nitric acid, still a great desideratum. They hesitated therefore to apply with confidence all the results yet obtained to the discussion of the important questions, with a view to the solution of which the investigation had been undertaken, and which they hope in future further to elucidate. As a general result, however, it would seem, that whilst the per centage amount of ammonia was generally less in the rain of thunder-storms and when there was a large fall of rain, the amount of nitric acid, on the other hand, appeared to be increased under the influence of storms. The results further indicated that the amount of nitrogen yielded by rain-water in the form of nitric acid was considerably greater than that which existed as ammonia, and since there could be no doubt that nitrates applied as manures greatly enhanced the growth of plants by virtue of the nitrogen they contained, the amount of nitrogen brought down from the atmosphere in the form of nitric acid must be considered to have a very important influence on vegetation.

Farm Experiments valuable in proportion to their size and duration.—No one can entertain a higher regard for, or appreciate more thoroughly the value of, practical experiments in agriculture than myself; but in my humble judgment, to be practical they must be fair; to be fair, they ought not to be very minute either in size or duration. The greatest and most successful experimentalist of his day, the late Mr. Coke, of Norfolk, held it as a maxim, to which he rigidly adhered throughout his long farming career (a period of at least half a century), that no experiment could be satisfactory to himself, or beneficial to the community, that was not of three years duration, and of a magnitude in some degree proportionate to the extent of the farm for which it was required. If, for instance, in riding over his extensive crops in and around Holkham, any particular variety of Corn, Turnips, or what not, attracted the notice of his farming friends, and he was asked his opinion thereon, the answer was sure to be, "I never give an opinion on this, or any other experiment, till after a three years' trial. This is only my first or second year" (as the case may be). "Come to see me at the three years' end, and I will tell you all about it." Nor was this a mere lilliputian garden-pot experiment, but one in some sort commensurate with the scale of his arable occupation (about 2000 acres in and around the park at Holkham), probably not less than 40 or 50 acres. There is both sense and value in a trial of this magnitude and duration; and though I do not go the length of asserting the necessity or even the possibility of such in all cases, we contend for the principle that the larger the experiment and the oftener it is repeated, the more satisfactory and valuable it will be, both to the experimentalist and the public. I have been led to these remarks by the letter of Mr. Wm. Dickenson, of New Park, Lymington, in a late Number on the enormous produce he tells us he has obtained and expects to obtain from Italian Rye-grass. Far be it from me to undervalue any experiment if fairly conducted; but I beg most respectfully to submit that this is not, and cannot be, a fair experiment; and in a practical point of view, it is of no value or weight whatever. The bare idea of selecting from a field (we are not told of what size) an insignificant patch of only a yard square, and thence deducing the acreable amount of the produce, does appear to me to border on the ridiculous; and somewhat of a piece with the land valuer, who produced a bag of earth as a sample of the soil of an estate. Where and how was this particular yard selected? In a field of any size—say 5, 10, or whatever might be the number of acres—there will, and must be, great inequalities in the length, strength, and thickness of the plants. Was it taken from the best, the worst, or an average of the general crop? How was it cut? and, above all, how was the exact measure defined? I have a right to ask these questions, because much, very much, depends on the manner in which the operation is conducted: one man, by a little close shaving, and a sort of Russian grasp at the boundaries of his yard, may make tons per acre more than another, who, from the same field, confines himself within the exact limits of his allotted patch. Do it the best way you can, it is not a fair experiment. The errors, whether of under or over weight, and there are sure to be some, will be multiplied 4840 times if an English, or 6150 times if a Scotch acre. By-the-bye, why talk of Scotch acres in the New Forest? This is complicating matters without any adequate reason. English experiments ought always to be in English measure; and any departure therefrom, in England, will only lead to confusion, and ought to be avoided. I hope Mr. Dickenson will not infer from what I have said that I mean to cast any reflection on his *protegée*, the Italian Rye-grass, as a crop. Far from it; and if I cannot go all lengths in his encomiums of it, I admit at once that it is superior in weight, and I think in quality, to the common Rye-grass. I only wish he would let us see and hear a little more of it; instead of one poor solitary yard, for instance, 5, 10, or more acres if he likes; the more the better. His proffered stake of 100*l.* would then, but not till then, carry weight with it in the minds of practical men. Just in the same category, and on the same page with Mr. Dickenson, we find Messrs. Hardy & Son with their yard of land, planted with 18 grains of Wheat, producing, as they tell us, after the rate of nearly 19 quarters per statute acre! Now, of what practical value is such a statement as this? Suppose a field of Clover-lea, say 20 acres—soil, light sand and gravel, perhaps in a game district—all ready for putting in a Wheat crop; do Messrs. Hardy mean to say that 6 pints of seed are all they would advise to an acre? The thing is so ridiculous that it is hardly worth refuting; game, rooks, larks, and slugs, to say nothing of wireworms, would make such havoc with the plant from its very thinness that the poor farmer would be very fortunate to reap as much as "2 quarters, 2 bushels,

3 pecks, and 5 quarts per acre," being the result of Messrs. Hardy's second experiment from the common mode of seeding. In practice I have no doubt such would be about the fact; viz., that the thin seeding would furnish the poor crop; the 2 bushels or 2½ bushels, not an extraordinary crop, perhaps, but a fair average for such land; probably 3½, 4, or even more, quarters per acre. But my present object is not so much to argue the question of thick or thin sowing as to enter my protest in this, as in Mr. Dickenson's case, against drawing an inference, either pro or con, from so contemptible a trial as a square yard of ground; and that, too, rich, highly cultivated garden ground. It can satisfy no one, least of all the practical tenant farmer, to whom his Wheat crop is, or ought to be, the first and most important object, and who, if foolish enough to act upon it, will assuredly find himself most lamentably deceived; and if he escape a lunatic asylum, can hardly fail of a berth in the county jail. *T., Gloucester, Nov.* 22.

Italian Rye-Grass.—Much of the misapprehension and diversity of opinion respecting productiveness of Italian Rye-grass has, we believe, arisen from the assumption that there is but one kind of Italian Rye-grass, or that all varieties possess the same properties or nearly so, whereas we have repeatedly proved that there are probably many varieties of Italian, as of English or Scotch Rye-grasses, and that the productive and nutritive properties of some greatly exceed others. This we found to be the case with a kind we procured from Mr. Dickenson, then at Mayfair, a few years since, as also another very productive variety, which for distinction we have kept under the name of "Sutton's" and the other "Dickenson's." So great is the difference in the produce of these and that of other varieties of Italian Rye-grass which we have sown, that we are not surprised at the great weight per acre grown by Mr. Dickenson with a copious supply of manure. Much of course depends on the cultivation, but we think the difference of the variety of Grass is too little attended to. *J. Sutton and Sons.*

Town Sewage.—Like Mr. Mechi, I was startled when I read the editorial remark which he has prefixed to his observations in a late number of this paper. My object, however, in addressing you is not to reiterate what Mr. Mechi has said, but to suggest to that gentleman that he would really do the public some good service if he would go down to Ayr and inspect, unprejudicedly, the lands of Mr. Telfer, and then publish with his characteristic candour the result of his investigation. The vexed question as to the capability of an occupier of an ordinary-sized farm to produce in a regular course of husbandry, on soils of average fertility and of different geological formation, the enormous crops of green Grass and dry hay quoted by Mr. Caird at Tiptree, would then perhaps be fairly represented. The following is a note from my diary, made on the occasion of a visit to Mr. Telfer's after the last Tiptree gathering. "Aug. 31, 1854.—Visited Mr. Telfer's dairy farm, near Ayr, in consequence of Caird's speech at Tiptree, in which he said that Telfer had made above 20 tons of hay per acre (Scotch) from his Italian Rye-grass, irrigated with liquid manure by steam power. I find the growing Grass most excellent; but as to the hay it does not exist, except to the extent of 1 cwt. or so, which was cut and dried by way of experiment from a small patch of a perch or so, and instanced by Telfer to Caird as a criterion of produce—not as a crop made—without any idea of his figures being quoted. It appears difficult to determine whether the extraordinary growth of this succulent Grass is to be attributed to the manure distributed by liquid, or to the copious application of water to the Grass in a growing state on a free and fertile soil, having the benefit of a peculiarly mild and (from close proximity to the sea) humid atmosphere. No frosts and extreme colds check growth; the land is protected by hills, and the soil being deep and open, little evaporation takes place. The rain-fall has been very small, hence the great benefit of water artificially applied. The manure does some good, but it is a secondary matter altogether. Mr. Telfer's root crops are admirable; but you cannot distinguish between the Mangolds which have been irrigated and those which have not. Mr. Telfer's cow-byres are well arranged. The cows lie on cocoa-nut mats, which save litter and are a cheap substitute. Mr. Telfer was most candid and communicative." *J. Bailey Denton, 52, Parliament Street.*

Dry-drill v. *Water-drill.*—Curiosity is usually excited when any novelty is introduced to the agricultural world. Various and contradictory opinions are frequently elicited from observers. There are those who are always prepared to pronounce favourably of anything that is new, and to lend it their advocacy; whilst others appear to manifest a natural abhorrence of novelty, and regard every new invention as utopian. But the great class of practical men are mainly guided in the formation of their opinions by close observation and the results of successive and repeated experiments. During the last few years the water-drill has shared no small measure of public attention, and opinions respecting it have been numerous and conflicting. Having witnessed some very successful results from its use in the north of Lincolnshire, I was induced to purchase one of Chandler's last year. At the London Farmers' Club last April, when Mr. Spooner introduced the following subject for discussion, viz, "On the application of manure, in a liquid state, to roots, Grasses, and grain crops," I stated that I was about to make a series of experiments with Mangolds, to test the comparative merits of the dry and water drills, the results of which I promised to publish in the autumn. I now redeem my pledge, and append a table showing every necessary particular, and giving the produce per acre of each experiment. The season has been an unfavourable one for making the experiments, as the drought and heat during the months of August and September were so intense as to stop the growth of the Mangolds in one or two instances entirely, whilst that of the others was greatly impeded. Nos. 4, 5, and 6 were the hottest land, and consequently the crop is a very light one. In No. 7 those sown with the dry drill were a total failure. I am therefore only able to give the produce resulting from the use of the water drill.

D. Finney, Secretary and Actuary.

Farmers' Daughters.—I am a working man myself, and therefore not likely to be biassed by any aristocratic prejudices in what I am about to say. The readers of the *Agricultural Gazette* are aware that a gentleman named Colville has recently brought a hornet's nest about his ears by having at a public dinner made some remarks which appear to me to have been either misrepresented or misunderstood. I cannot now call to mind Mr. C.'s exact words, but I believe the purport of them was simply this:—That as farmers' daughters in the course of time become farmers' wives, it is better that they should be taught the proper management of a farmer's household than be trained up as imitation ladies,—learning a little of everything that is of no use to them, and very little of anything likely to be really serviceable in their future condition of wives and mothers. Now, supposing that my construction of Mr. Colville's meaning is correct, can any reasonable man say that he is not right? Or will any one practically acquainted with the habits and manners of the middle classes at the present day deny that in their anxious aspirations after gentility the rising generation neglects, and too frequently despises, that more useful and substantial knowledge which is necessary to enable them to do their duty in that state of life to which they are likely to be called? Every man who is in the habit of associating with young women (young ladies I ought to have written, there are no women now) knows full well that they are far better acquainted with the manufacturing of "anti-macassars," fancy stool-covers, bead bottle-stands, and similar tawdry ornaments, than with making a shirt or darning a stocking; and as to making up the butter after it is churned, preparing a meat-pie for the family dinner, or getting a fowl ready for the spit, why the bare idea of doing anything so "very low" is sufficient to make many a modern young lady blush. And not only in behaviour and occupation, but in dress, it is the fashion for young women of the middle class to ape those above them; and the daughter of a little tradesman is often more showily dressed when she appears in public than the daughter of the proprietor of three-fourths of the parish. Then, as a matter of course, the servant girl apes her young mistress—for fondness of finery is as catching as the measles—and so every maid-of-all-work sports her stylish bonnet and her parasol, even if she has not a decent change of under clothing. This passion for dress is an increasing evil;—it "grows with the growth, and strengthens with the strength:" and when honestly earned wages are found insufficient to supply the growing demand, dress must be obtained by other means. This is not an imaginary or even a highly coloured picture; those who are loudest in condemning Mr. Colvile's "selfish illiberality," and so forth, might see such things happen under their own eyes, if they are not blinded by the rapidity with which they run after what the cant of the day calls the "onward movement." Now, I am myself as strenuous an advocate for progress as any one of those who have taken up the cudgel against Mr. Colvile; but I would have us advance cautiously and securely, feeling that the ground before us is firm before trusting ourselves upon it, not hastily striding forwards on to slippery soil, where we cannot establish ourselves, and then sliding two steps backward. In other words, I would have the rising generation made useful rather than only ornamental members of society. By all means let young people learn all the accomplishments within their reach; but first teach them those things that are absolutely necessary to fit them for the proper performance of the duties of their station. By all who will be obliged to work for their living, music, dancing, and fancy-work ought to be looked upon only as recreations for their leisure hours, not made the chief end of their existence. In short, I would have our sons and daughters taught to be men and women, instead of mere male and female "gents." *A Countryman.*

[Mr. Colville's meaning *and* his words (for the two appear to have materially differed) may be so explained as that every one shall be ready to adopt them, just as they will to acquiesce in the very sensible letter written by "a Countryman." The question, however is not one of general truths, but simply this, whether or not in the case and to the audience before him, Mr. Colville was justified in speaking as he did. It is impertinent to talk of "aping" gentility to those in whom it naturally exists; and those who invest their 2000*l.* to 3000*l.* in agriculture, ought not to be blamed for seeking a liberal as well as a practical education for their children.]

Societies.

Witham Agricultural: At the late meeting of the Labourers' Friend Society here, Mr. Mechi congratulated the society sincerely on its determination to have it of a purely agricultural character; it was quite clear that in a society constituted like this, where men of all parties could meet on the most amicable footing for the sole purpose of improving our national agriculture, if they converted it into a political arena, they must also convert it into as many societies as they had differences of opinion, and that would be destructive to it. They were met for practical purposes, and he would proceed to those points. There was one part as to the prizes for drainage on which he thought they were not pursuing a right path. Some years ago he proposed a prize for drains, 5 feet deep and not opened very wide, with small inch pipes, in strong clay soils. The committee, after one or two trials, considered that not a proper depth, and they gave separate prizes for a depth of 3 feet. Now, on public grounds, he objected to this, because they were acting against the perfectly understood opinion of the country. If they went to the Drainage Commissioners, or the other public bodies, for advancing money for this purpose, they would not grant them 1*s.* for drainage done so shallow, and, therefore, so inefficient as 3 feet; and thus they were positively setting up their individual opinion on drainage against all the authorities on the subject, and at the same time doing a great evil, because they were encouraging a wrong principle. He trusted their neighbourhood would not consider its own practical knowledge superior to the whole practical knowledge of the kingdom on that subject; and that the matter would be reconsidered. Another point he would allude to, and on which he could congratulate them, was the improved feeling as to the employment of agricultural steam machinery. A few years ago, when he put up his steam-engine, a good deal of ridicule was passed upon him, and a great many sneers were heaped upon his head; but it was a great source of comfort to him, on public grounds, to find that steam-engines were adopted now as commonly as the old-fashioned machinery used to be; and he knew it would be more common, year by year, as the agricultural mind became more intelligent on that matter. They had steam-engines that would have been thought most extravagant a few years ago at 300*l.*, for the farmer now said "with a steam-engine to thresh corn I can turn my horses to other things." He should like to see a prize given for the engineer who had been the longest on a farm; for the man who had a steam-engine now was in rather an unfortunate position—if anything was the matter with it, whither was he to go to have it repaired? At present they had at every parish, at their own doors, a blacksmith and a wheelwright, and if they used steam-engines, as they were using them, it would be necessary to have at the smithy a turning-lathe, and the apparatus that was required for the

repair of all moving machinery. There were many fixed charges that pressed upon them, such as rent, rates, taxes, and labour, and these could not be reduced; how important, then, was it they should progress, and augment their production, for as they increased their produce they reduced all these expenses. A great story had been made lately of Mr. Caird's statement of a large production of green food.

Mr. Wm. Hutley: Dry hay.—Mr. Mechi: I see no difference between Grass and hay. Will not so much Grass make so much hay?—Mr. Hutley: It was not a question of Grass, but hay.—Mr. Mechi: Grass becomes hay. Am I right, my lord?—Lord Rayleigh: You can't make hay without Grass. (Laughter.)—Mr. Hutley: The question was asked two or three times—do you mean, tons of dry hay, and he said, "yes." It was in print.—Mr. Mechi: Should you be satisfied if you got the Grass?—Mr. Hutley: I should not know what to do with it—I could not make it.—Mr. Mechi: I am sorry for you.—Mr. Hutley: I am sorry for the man who can tell such lies.—Mr. Mechi: The hay could not be made without Grass, and he showed there was so much Grass.—Mr. Hutley: I deny it.

Mr. Mechi said, Mr. Telfer, to diminish the cost and charges, the fixed charges on the land, put on one ton 5 cwt. of guano washed in with the liquid manure of 10 cows and 500 tons of water, which was 5 inches more than the natural rain gave him, and he produced from 60 to 75 tons of green Grass per acre. He alluded to this to show that if they could thus largely increase the produce of the soil, they diminished rent, rate, taxes, and every fixed charge to a great extent, and they not only produced more food for the people, but they employed more labour; if they did not allow that, they must say that the less they produced the better it was for them. (Hear.) Mr. H. Dixon said, he stated something at the last meeting as to an attempt he had made to farm on the system of Mr. Smith, of Lois Weedon, but he was not then able to state the result, which he would now do. The first year, as he stated, he put the land under an 18-inch digging of two spits, and he put in Beans 5 feet apart in single rows, and between the Beans he put rows of various vegetables, to ascertain which would answer the best—Carrots, Parsnips, Mangold, Onions, Swedes, and Potatoes. When he was here last year he had no opportunity of realising the crops; but he could now state that the Carrots and Mangold were good crops; the Bean crop was rather over 2 quarters an acre, which he called a decided failure; the mangold was 15 tons an acre, and rather over; the Turnip crop he did not take the weight of—they were not well planted but fine Turnips. The Potato crop yielded 160 bushels to the acre, which he sold at 4*s.* per bushel, being 32*l.* per acre; the Parsnips were good; altogether he thought the result was in favour only of the Potatoes, Mangold, Turnips, and Parsnips; and taking the general result, he had an ample crop on the whole. This land was 52½ rods long; and in every row of roots he used 14 lbs. of guano and 14 lbs. of salt. Where the roots grew last year he this year had Wheat on Mr. Smith's system, and between the Wheat rows of Mangold; he had the crop of Wheat realised this morning, and it was 34 bushels to the acre, which was below his expectations, for the land by the side of it produced 6 quarters an acre, and he had seen 8 quarters on it, which, however, he should never see again if he farmed for 100 years. But then there was the deep cultivation of this piece of land, which he expected to reap an advantage from hereafter, for he believed its physical condition was much improved. Then came the Mangold, and this was to a great extent a failure. He told the roots that morning, and he had a little over 7000 an acre, and if they weighed 1½ lb. each, that would be 5 or 6 tons an acre. But then he had 32 bushels of Wheat, which was a fair crop. On the whole he should say that the system would not be profitable to farm that land on, and he thought he could make more of it by having it in a uniform crop. He knew, however, that Mr. Smith had grown 24 tons of Swedes an acre, and 8 quarters of Beans on the same land, for no one would question Mr. Smith's statement; Sir T. Parkins, too, had told him that he himself weighed the crop, and he had no reason to question it. Whether they should ever grow a crop like that he could not say. This year, as he had another large farming operation in hand, he should stop in the trial of the system, and whether he should go on again hereafter he could not say; but he believed that he had gained nothing by it, and that he had lost nothing. It was a curious fact in connection with the matter that these Potatoes were planted entirely in the under soil, the 9 inch upper soil being turned below, and they had less disease than any in the neighbourhood. He was happy to say, from information he had acquired from various directions, and from what he had seen of the specimens in the field to-day, that the Potato disease seemed far less virulent than it had been since 1844,—not that the Potatoes in the field to-day were fully free from it, for few of the thin-skinned Potatoes were free from it—they all exhibited symptoms of it, and he believed they would be rotten before Christmas; but the rough skins appeared in a sound state. Mr. Skirving, while exhibiting some Potatoes on his stand last year, told him (Mr. D.) that he wished him to try them and cultivate them; he did take a few of them, and having tried them found them the best he had ever eaten; he had 9 bushels of them. They were called "Flukes's," and were grown by a farmer in Lancashire, for whom Mr. Skirving sold them, and he (Mr. D.) gave 10*s.* a bushel for them—a good price. He put them into a good piece of ground. At the same time a friend of his from Ireland, who was on a visit to him, observed he had got better than them, on which he told him to send him some. He did send him some, which he called Irish Dons, and he set them. When he took them up he had from those he bought of Mr. Skirving 51 bushels of fine Potatoes, and 1 bushel only of defective Potatoes and chats. The other Potatoes, which he had from Ireland, he put in whole, and they produced 3 bushels to the rod—the Flukes from Lancashire were nearly the same. Then again, he had 42 Potatoes from Shelley, who exhibited his produce here last year; he planted them on the third of a rod of ground, and he had 2 bushels of Potatoes. Now, no crop, he thought, was so essential as Potatoes to the poor man; and on their allotments they had not only got a large crop, but they brought from the soil a greater quantity than any farmer could. (Hear.) He meant to say that they decidedly improved the poor by this system of allotments. (Cheers.) It was quite certain that the poor man paid for his plot of ground a higher rent than an ordinary tenant would do; but he was thoroughly persuaded that if they would secure him an allotment in this way, without trenching on the time of his master, they conferred a greater boon on him than had been conferred by any other means within his recollection. Let the poor man have every possible advantage that could be given him, and they could not do him a greater benefit than in letting him a small piece of land. Again, if the commons could be brought into cultivation, and the claims of lords of manors done away, a great quantity of land would be let loose, and that would be a great benefit, because labour was the wealth of this country.—The Chairman said Mr. Dixon had stated the results of his experiments on Mr. Smith's system, and he (Lord R.) had tried it in another way; for, instead of having manure for crops between, he had a naked fallow and no crop at all. The field had been three harvests ago in the natural four-course shift in Wheat, and so he began it by giving Wheat. He planted half the field in intervals with Wheat, and trenched the intermediate ground. Last year his produce was 2¼ quarters per acre; this year he had Wheat where the fallow was last year, and he had 5 quarters 5 bushels, which sold at 14*l.* in Chelmsford market.

Mr. W. Hutley asked, had not the field been down in Grass a great many years?—Lord Rayleigh said it was originally Grass, but it had not been Grass in his recollection.—Mr. Mechi asked what was formerly the average crop of that field? Lord Rayleigh: I cannot say.—Mr. Dixon: To what depth did you double dig it?—Lord Rayleigh: Not so deeply as you did. I should be almost inclined to say you brought up too much maiden earth at a time; I did not bring up more than 2 inches.—Mr. Dixon: What did it cost you?—Lord Rayleigh: I have not the figures. I do not mean to say it pays. I have tried the experiment, and got my crop, and that is a point I may begin to consider now.—Mr. Dixon: What I paid my men was, 2*d.* for the first rod and 2½*d.* for the second, and they could earn 2*s.* 6*d.* a day.

Mr. Forster said he was glad to hear Lord Rayleigh state the amount of crop in his field, for he had watched it often and he did not think it would come to 5 quarters an acre. He thought if it had had a fair trial it would have done better, for he considered that those trees by the side had injured it to the extent of 2 bushels. Some time since he requested his lordship's permission to stub up some wood land, and he then stated to him that he should lose 50*l.* by it in 20 years. He did not know whether his lordship agreed with him, but he gave him leave to do it; and he would now give them the statement of what would have been his actual loss:—

Wood Land.

Debtor and Creditor Account of 1 *acre of wood land (underwood) for* 28 *years, cut once in* 14 *years.*

Dr.	£	s.	d.
14 years' rent, tithe, rates, and income-tax	28	0	0
Interest at 5 per cent. upon payments as made yearly for 14 years	9	2	0
Cr.	37	2	0
By 14 years' growth underwood sold	6	10	0
Ditto loss first 14 years	30	12	0
Ditto second 14 ditto	30	12	0
Compound interest at 5 per cent. upon 30*l.* 12*s.* the loss of first 14 years, for the last 14	30	0	0
	91	4	0

Loss in 28 years, 91*l.* 4*s.* but much more if compound interest is charged upon every payment half-yearly.

Then, as to timber—he had stubbed 13 acres of his own; he had bought it, and he knew what it cost; it had grown five years afterwards, and he was convinced it would not pay him 3 per cent.—would not pay him so well as it would if he sold it and put the money into the bank, and therefore he stubbed it. Then as to hiring land in high and low times, if one farmer hired a farm of 445 acres in a low time, at 23*s.* 3*d.* per acre, and another hired in high time the same quality and quantity of land at 30*s.* per acre, and farmed them at the same rent for 32 years, the difference to the one who hired at the cheaper rate, if he improved it by putting it out at interest every half year, would amount to 11,571*l.* 10*s.* 7*d.** (Hear.) As to the growth of Wheat, he did not like this new specimen of Wheat, but he thought they were wrong in not raising new varieties of all sorts of grain, for there was scarcely ever a new stock of Beans. He had raised four stocks of Wheat, and with them could beat the old stock for a certain number of years, but after that they degenerated. It was stated that this new specimen was Egyptian Mummy Wheat, raised from some kernels that came from a mummy; but a few years ago he bottled some Wheat, which he sowed this year, and did not see a kernel of it come up.—Mr. Dixon said, he had ploughed some turf and had been burning it, and he had upwards of 1000 loads of ashes burned on 4½ acres; the plough went over and then the ashes were spread on the top, and next year he should have the results to tell them.

Chemico-Agricultural of Ulster.—*Qualities of the Guano sold in the North of Ireland in* 1854.—Dr. Hodges brought under notice his tables displaying the extraordinary extent to which our northern farmers are victimised by manure dealers. In Belfast and the neighbouring districts, owing to the information afforded by the publications of the Society, comparatively little injury had been done, and the vendors of the unadulterated manure had been protected; but in remote districts where the farmers had not become members, and where proprietors had not a sufficient amount of intelligence to encourage their tenants to avail themselves of the assistance offered by the Society, much had indeed been lost "from lack of knowledge," and cargoes of stuff worth not more than 3*l.* per ton, had been sold for genuine guano. It was not wonderful that farmers, thus foolishly induced to purchase mixtures of earth merely perfumed with guano, should lose all confidence in foreign manures. One of the samples pointed out by Dr. Hodges was worth only 26*s.* per ton, and another which had been sold in the county Derry, contained 54 per cent. of earthy matters.

Reviews.

The Scottish Agriculturist's Almanack and Year Book of Progress for 1855. By J. L. Morton. Published at 9, Pitt Street, Edinburgh.

This in its business information is strictly a Scottish almanac: but as to its calendar of operations and agricultural intelligence, it is English as well as Scottish. It contains blank pages interleaved, which make it useful as a pocket memorandum book. To make it more thoroughly what for this purpose it should be, we would cancel all its poetry, and much of its conversational style, and cram what space could be allowed for the price with agricultural data, results, instructions, and information. Prolixity is unpardonable in a "Year Book of Progress" such as agriculture is now making. We extract the following condensed statement of Col. M'Douall's experiments on cattle feeding, to which reference has already been made in our columns:—

"The cattle were Galloway bullocks two and three years old, and the experiments extended over a period of a hundred days. The Bean-meal used cost per ton 7*l.*; oil-cake, 7*l.* 15*s.*; and Rape-cake, 4*l.* 10*s.*

"Lot I. Each animal consumed daily 95 lbs. Mangold in three feeds, 4 lbs. dry Bean-meal, and 7 lbs. of Oat straw fodder. The gain between the lean and fat value, irrespective of manure, was

* Or the 6*s.* 9*d.* per acre will buy him 3 cwt. of guano every year at 10*l.* per ton per acre, for his Turnips 100 acres; or thresh 100 acres of Wheat and 100 of Barley; or drain 62½ acres with 2-inch pipes, 2 roods apart, thus draining all his land in 7 years; or employ five men at 10*s.*, and a strong lad all the year.

1*l.* 16*s.* 10¾*d.* per head; and taking 20 tons of Mangold and 30 tons of Swedes as a fair crop, the return for roots consumed amounted to 16*l.* 13*s.* 4*d.* per acre. When not otherwise mentioned the same quantity of fodder is to be understood as having been used in the experiments.

"Lot II. Each bullock took 130 lbs. Swedes per day in three feeds, and 4 lbs. dry Bean-meal, and yielded a clear return of 1*l.* 15*s.* 9*d.*, thus leaving 18*l.* 5*s.* 7*d.* per acre for Turnips consumed.

"Lot III. By each animal 130 lbs. Swede Turnips were daily consumed, besides 3⅜ lbs. oil-cake. The clear gain per head was 1*l.* 15*s.* 11½*d.*, and the return per acre for Turnips 18*l.* 5*s.* 7*d.* The oil-cake used was therefore equivalent to 4 lbs. Bean-meal.

"Lot IV. Nothing but Mangold and straw were given, 120 lbs. of the former, and 7 lbs. of the latter being consumed by each animal. The profit per head was 2*l.* 12*s.* 10¾*d.*, but this only yielded 17*l.* 18*s.* 4*d.* per acre as the price of the Mangold.

"Lot V. Each animal used 150 lbs. Swede Turnips, and 7 lbs. Oat straw per day, and left of profit 2*l.* 11*s.* 11½*d.*, being at the rate of 20*l.* 14*s.* 0¾*d.* per acre for the Swedes.

"Lot VI. Swede Turnips were given in two feeds, 100 lbs. being consumed per day by each animal, besides 4 lbs. Bean-meal, and 3 lbs. cut straw cooked and given at noon. The returns, after counting firing and extra labour in cooking, were 2*l.* 5*s.* 5½*d.* per head, or 24*l.* 6*s.* 3*d.* per acre for the Turnips.

"Lot VII. With 80 lbs. of Mangold per day, and cooked food, same as in Lot 6, the clear profit was 1*l.* 18*s.* 9½*d.* per head, and the return for Mangold 18*l.* 17*s.* 1*d.* an acre.

"Lot VIII. Each animal took 100 lbs. Swedes per day, and a cooked feed consisting of 5 lbs. Rape-cake, 5-7ths of a lb. of Bean-meal, and 2½ lbs. cut straw for 82 days. Afterwards same quantity of Turnips with 4½ lbs. Rape-cake, ⅔ of a lb. Bean-meal, and ⅔ of a lb. oil-cake cooked with cut straw. The profit per head was 1*l.* 10*s.* 3*d.*, equal to 19*l.* 7*s.* 6*d.* an acre for Turnips.

"Lot IX. Small Mangolds, 16 tons per acre, were given at the rate of 75 lbs. to each animal per day, along with 3 lbs. cut straw, 3 lbs. Bean-meal, and 2⅔ lbs. Rape-cake cooked, and given in one feed, and gave a profit of 2*l.* 0*s.* 4½*d.* per head, and 16*l.* an acre for the roots.

"Lot X. Large Mangold, 20 tons per acre, same in other respects as No. 9, gave 1*l.* 16*s.* 2½*d.* of profit, and 18*l.* 15*s.* 11*d.* per acre for the crop consumed.

"Lot XI. Each animal consumed 100 lbs. of Swedes per day, and 3 lbs. cut straw, 3 lbs. Bean-meal, and 2½ lbs. Rape-cake cooked. The Turnips were grown on good land worth 25*s.* an acre, and the returns which are meant to be contrasted with those of Lot 12, were per head 2*l.* 2*s.* 1*d.*, and by the acre 23*l.* 2*s.* 6*d.*

"Lot XII. Cattle fed same as in No. 11, but with Turnips grown on land only worth 15*s.* an acre. The profit on each animal was 1*l.* 11*s.* 11½*d.*, and the feeding value of the Turnips by the acre 19*l.* 13*s.* 9*d.*

"Lot XIII. Fed with 100 lbs. of Swedes per day, and 3 lbs. cut straw, 3 lbs. Bean-meal, and 2½ lbs. Rape-cake cooked. Instead of straw, 7 lbs. hay cut before flowering were allowed. The gain per head was 1*l.* 14*s.* 1*d.*, while 19*l.* 8*s.* 10½*d.* were left for each acre of Turnips used.

"Lot XIV. No difference in treatment, only the hay used had been cut when *in flower*. Returns 1*l.* 8*s.* 10*d.* per head, and for Turnips 18*l.* 13*s.* 9*d.* per acre.

"Lot XV. Fed as in Lot 13, but hay used not cut till ripe. Profit on feeding 1*l.* 8*s.* 0½*d.*, return for Turnips 17*l.* 6*s.* 7*d.* per acre.

"Lot XVI. Each animal fed as in Lot 13, but got Oat straw instead of hay, and left 2*l.* 1*s.* 4½*d.* of profit, and 22*l.* 19*s.* 7*d.* per acre for the Turnips.

"Lot XVII. Long Red Mangold 70 lbs. per day, cooked feed same as in No. 13, and 7 lbs. Oat straw; left 1*l.* 14*s.* 5*d.* of profit, and for the acre of Mangold 18*l.* 17*s.* 9¼*d.*

"Lot XVIII. Fed as in No. 17, but with Yellow Globe instead of Long Red Mangold. Each bullock left 1*l.* 16*s.* 2*d.* of profit, and the Mangold was worth 17*l.* 10*s.* an acre.

"Lot XIX. A cooked feed same as in last lot, but 84 lbs. white Carrots were given instead of Mangold. The returns per head were 1*l.* 12*s.* 5*d.*, and the roots by the acre 16*l.* 10*s.* 6½*d.*

"Lot XX. Cattle in loose boxes fed on Turnips 150 lbs. per day, and 7 lbs. Oat straw, left per head 2*l.* 19*s.* 11*d.*, and per acre for Turnips used 20*l.* 18*s.* 9*d.*

"Lot XXI. Fed in stalls instead of loose boxes with same food as in No. 20; yielded 2*l.* 16*s.* 8*d.* per head, and 20*l.* 6*s.* 3*d.* per acre for Turnips.

"The practical conclusions to be drawn from these important experiments seem to be the following:—

"1st. Swedish Turnips and Mangold can be most profitably used along with a cooked feed of cut straw and Bean-meal, each acre of roots being sufficient to keep one additional animal if so consumed.

"2d. Bean-meal at the prices stated is of greater fattening value than Rape-cake, and 4 lbs. of raw Bean-meal is equal in feeding value to 20 lbs. of Swede Turnips, and if cooked becomes equal to 50 lbs.

"3d. Oil-cake at 7*l.* 15*s.*, and Bean-meal at 7*l.* per ton, are about equal in feeding value.

"4th. Turnips grown on good land, weight for weight, are of greater value than those grown on inferior soils.

"4th. Good Oat straw is of as great feeding value as the best hay, weight for weight, and is superior to second or third-rate hay.

"6th. Red Mangold is of fully greater feeding value than yellow, and both are better than white Carrots.

"7th. Where straw is abundant loose boxes are to be preferred to stalls for feeding stock, and both are far superior, as proved by former experiments, to open courts.

"The cooked food was prepared as under:—The water in a boiler being brought to the boiling point, 4 lbs. of Bean-meal were stirred in for each animal. To this 3 lbs. of cut straw chaff per head were added (5 lbs. are now given), and on being well mingled together the fire was withdrawn, the mixture covered up for a few hours, and served out at mid-day."

Calendar of Operations.

NOVEMBER.

Berwickshire Merse Farm, *Nov.* 20.—The protracted dry weather of this autumn has been very favourable to Wheat sowing on fallows and Bean stubbles; especially as the latter required a little cleaning, the early and superior claims of the Turnip plants having somewhat curtailed their due amount of hand-hoeing. Showers, though neither heavy nor frequent, along with fresh weather, have produced a good braird, which could not have been so speedily obtained in the over-dry state of the soil previous to the middle of October. Turnips, with rare exceptions, are now ascertained to be below an average crop, and all their bright promise has been blasted by mildew, save on some strong clays where the drought had less effect. Prices consequently range high for the time of year, viz., 4*d.* for hogs, and 6*d.* for old sheep per week. Thus there is need to economise the crop as much as possible, and it is only now that some breaks have been got cleared for Wheat sowing. But the weather has been soft for a week past, and we cannot expect the land to work so favourably as during last month. Thrashing has proceeded to some extent now, except where water powers are ill supplied; and the universal result is far from realising the extravagant statements current of a double crop, or even a half more than usual. The facts, as ascertained by the late statistical inquiry, seem to be that Wheat and Barley are somewhat above an average, and Oats quite as much below it, that Pease are a small crop, and that Beans alone have equalled the very moderate expectations formed from their appearance during summer. All kinds of fodder, except Oat-straw, are abundant enough. On the 26th October the frost was pretty hard, but otherwise the weather has been uniformly open. *J. T.*

Lammermuir Sheep Farm, *Nov.* 18.—Hill sheep are this year in first-rate condition to face the winter. The pastures have this summer been excellent, and the long and open back-end has put the stock into higher condition than they have been for several years. A considerable number of ewes that have brought lambs this season are now pretty fat, and this is very rarely the case on a common and mixed hill range. Bathing has this year been accomplished in most favourable weather. The usual time for doing this is in the end of October or beginning of November; October is preferable, as there is then the best chance of good weather, and it is essential that the operation should be got over when the weather is dry. Cheviot hogs are now getting Turnips, the crop of which seems rather small; the bulbs have, however, made marked progress during this month and are still swelling. Hogs do much better when they are allowed a run off during the day, or part of it, into a Grass field, or better still on to Heather. Sheep relish much a variety of food, and it is especially healthy for hogs. We have observed an inferior lot make great progress and winter without much loss when allowed this liberty, when to have confined them close on Turnips would have killed many of the weakly ones. This, moreover, seems quite a natural system of wintering hogs, for when they are set at liberty they are seen to spread away diligently over their range, and in a few hours return to the Turnip break of their own accord and begin to eat with great relish It is also observable that when they have liberty of going off and on to Turnips and Grass land at their own pleasure, that nearly as many are on the Grass as on the Turnips. It is of great consequence, however, that the land of which they have the range should be dry and sound pasture. We have experienced the bad results of letting hogs regularly off their Turnips over undrained meadow land, and never succeeded better in wintering Cheviot hogs than when along with Turnips they had the range of a hard, sound, heathery hill. It is desirable that hogs should learn to eat Turnips well before hard weather sets in. Experience has shown that ewe hogs are much more hardy and vigorous, and can be wintered on far fewer Turnips, or as is pretty generally the case, without Turnips at all, than wedder hogs. It is necessary, however, to draught out the weakly ones at this season, and give them the Turnip wintering of the wedder hogs. *J. B*

West Sussex, *Nov.* 22.—We may now be said to have got to the end of Wheat sowing, and never has there been a finer season. The land has worked light, and the labour has not been nearly so much as usual. The summer was far too dry for some things, but the fine showers that we have had from time to time during the last two months have brought the land into the best possible state for working; and now there is no time to lose in getting that intended for root crops turned up as quickly as can be done, as the way it now turns up will leave it so open that the frost will find its way through it well; but there has been a great extent of it sown with Rye and Tares for spring feed, the Turnips having turned out so far below an average crop; but even they have made up very much in the last two months. The grub got at them, and hardly one escaped without more or less damage, but when the land got a little moist, they left them, and since then they have recovered, and Swedes, though small, are of good quality; but Turnips have not done so well, especially those that were sown very early. The dry weather brought them to maturity too quickly, and they were past remedy when the rain came, and many of them have rooted. But the good appearance of Tares and Rye, and also Trifolium, will more than make up for this drawback, so that we are not likely to be worse off than usual. Hay is scarce, and will perhaps be dear, but all straw is healthy, and we must make that of the Oats and Barley to take its place partly. Mangold Wurzel is mostly all got under cover; it has also been a light crop. The cold checked it when coming up, then the dry weather came upon it before it had time to get to any size, but it is good so far as it goes; and here we must say a few words in its behalf, as a crop on land too heavy for Turnips. It seems the only root that we can have for this purpose, as it matters little how heavy the land be: if it is laid up in raised drills, the dung buried right below the seed, in ordinary years there is no fear of a crop. We like the raised drills best for it, because that allows the dung to be put where it is wanted—right below the plant; and because the earth being raised higher lies lighter, and every time the horse or hand hoe is used, the earth crumbles down, thus leaving the plant more room to spread itself. But one more advantage in heavy or wet land is that we can take it off in time to get in Wheat, and thus most likely be able to work it at a time when it is drier than it will be in early spring; but if unable to sow Wheat in it, we can leave it till the spring, and sow Oats early, or Barley at a later period, so that by no other method that I know of can heavy land be turned to better account; and where part of a farm is heavy, it ought to be set apart for 1, Wheat; 2, Mangold Wurzel; 3, Wheat, Oats, or Barley, with seeds sown in spring, and 4, Clover mown. The Wheat after Clover will require dung, and so will the Mangold Wurzel, as everything is carried off. Respecting their running to seed, that has been rather common this year—the dryness of the weather has no doubt assisted it—we have had but few of the Red Globe that have done so. The Orange Globe were worst, but not so bad as some say they have had them, certainly not one per cent.; but even then the field presented a rough appearance, and a passer by might have put it at much more, as perhaps has been done in similar cases. But why is it that they are more liable to run up now than they used to be? I am disposed to think that it is because they are more acclimatised, and so should not be sown quite so early if we wish to prevent it, but, as I said, there are so few that do run that we ought not to put off sowing on that account. The Yellow Globe have been longest cultivated, and therefore may be most likely to seed. *G. S.*

Notices to Correspondents.

Barley: *G B.* It is often given to fatting sheep. Peas are better. Perhaps some of our correspondents will state their experience. A bushel a day among a hundred will be sufficient to begin with.

Dr. Newington's Dibble. *An Old Sub.* We do not know who now sells it. Probably it may be shewn next week at Baker Street.

Farm Accounts: *Danum.* If you have access to the "Cyclopædia of Agriculture" published by Blackie read the article on that subject, and tell us your difficulty after doing so. The best plan of managing the valuation of tenant right is to have in your ledger several accounts opened to be closed at the several dates named, in order to which you must, at the close of each year, take credit for a portion only of what appears on the Dr. side—a certain fraction (whose denominator is the number of years the account has yet to run), being each year a burden on the profits of that year. And then if you have by extra manuring or otherwise invested a sum not fairly chargeable upon the produce of the current year, it must be placed on the Dr. side of that particular tenant-right account in your ledger which closes at the date where this particular improvement is supposed to become exhausted. If this is not intelligible we will explain further; but read that article in the first place.—As to poultry, Mr. Baily's book will answer your purpose.

Gorse: *D N M* asks for a method of destroying Gorse out of a pasture without pulling it up. "It is young as it is frequently mown, but it has a strong root-hold." It is plain that this root-hold must be destroyed, and how that can be done unless by grubbing up the plants we do not know.

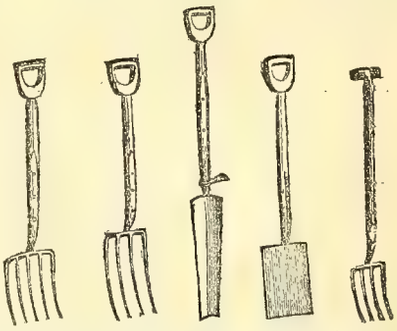
Liquid Manure: *A Clergyman's Wife.* It may be applied to all sorts of garden vegetables and fruit trees. The mere drainings of a farm-yard are not likely to be too strong, and you may apply just as much as you can obtain, and as strong as you can get it.

Sewage Manure: *Nemo.* The particulars of Mr. Brooks' offer were given in our last.

WEEDS ON WALKS.

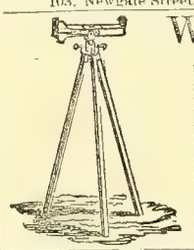
MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by Alexander Shanks & Son, Arbroath, Forfarshire, from whom particulars with prices may be had.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.



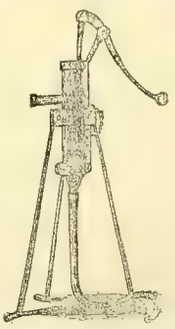
WEIR'S DRAINING LEVEL

Price 20*s.*

These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.

Edward Weir, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.



The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.*

The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel,	Length of Barrel, under nose.		£ *s. d.*
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1 12 0

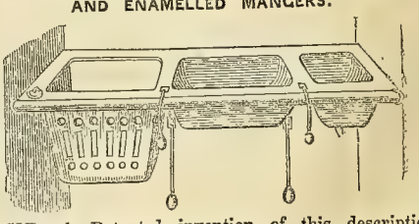
The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.



THE only Patented invention of this description constructed so as to prevent considerable waste of Hay and Corn, together with all the newest improvements.

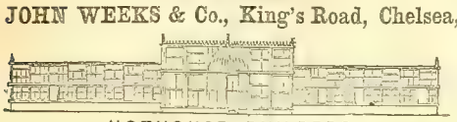
STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.

Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 35*s.* each. Cattle Show, Stand Nos. 275, 276, and 277.—James Barton, Iron Founder, &c., 370, Oxford Street, a few doors east of the Pantheon.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

HORTICULTURE IN ALL ITS BRANCHES.

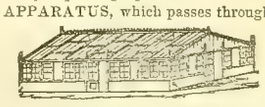
JOHN WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention. Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.



Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the CRYSTAL PALACE, SYDENHAM, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. CONSERVATORIES AND AVIARIES fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. WINDOW BLINDS of every possible description, of the very best materials and workmanship.

N.B. An allowance to nurserymen and the trade.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.

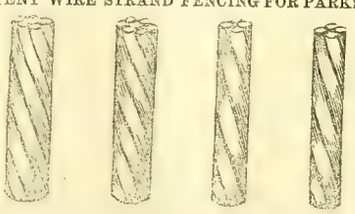
BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

CHEAP WIRE GAME & POULTRY NETTING

5*d.* per running yard.

GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, near the Gate, Kingsland, London.

POULTRY, RABBIT, SHEEP, AND CAT FENCING. Hare or Rabbit Nets, on Cords, for Covert Shooting, 12 mesh over, 4 feet wide, 1½*d.* per yard.; 18 mesh over, 6 feet wide, 2¾*d.* per yard; 24 mesh over, 8 feet, 3*d.* per yard; each Edge Corded, ½*d.* per yard extra; extra Stout ditto, 18 mesh wide, 4*d.* per yard, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing against fowls, cats, &c., at W. CULLINGFORD'S, No. 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

NETTING FOR SHEEPFOLDS, made of Cocoa-nut Fibre; a material known to possess the most extraordinary durability when exposed to the alternations of weather. It will wear out several sets of tarred hemp netting, and is so light that a herdsman may with ease carry 200 yards of it. Price 4*d.* and 6*d.* per yard. Sold in Nets of 50 and 100 yards long, 48 inches high, by the Manufacturer, W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

BIRD NETS, BAT-FOLDING NETS, for Bird Catching, 5*s.* each; with Bamboo Poles complete, 10*s.*; extra large, 15*s.* complete. Clap Nets for Bird Catching, 12 yards long, 5 feet deep, 15*s.*; with staffs, pull-line, and stop-cord, 1*l.* Lark Nets, made square mesh, any size required, 3*d.* per square yard. A Partridge Trammel, 30 yards long, 5 yards wide, made square mesh, 1*l.* 11*s.*; or any less size, 2*d.* per square yard.

W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

GARDEN NETS, FISHING NETS, SHEEP NETS, AND RABBIT NETS (made by hand, as machine-made knots slip), supplied at very low terms. Samples sent free.

W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, Kingsland, near the Gate, London.

Six Tents to sell cheap.

The above are exhibited at the Smithfield Cattle Show.

GARDEN NETS, FISHING NETS, SHEEP NETS, AND RABBIT NETS, made by Machinery, and supplied at very low terms. Samples sent free.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

WIRE FENCING, 6¾*d.* per square yard, in various widths, from 6 feet to 15 inches, mesh less than 2 inches. An effectual fence against Hares, Rabbits, Sheep, Deer, &c., and for the enclosure of Poultry, Pheasants, &c. 4-inch mesh, 4*d.* per square yard.

R. RICHARDSON, 21, Tonbridge Place, New Road, London.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide, 1*s.* per yard run—admits light and excludes cold; thick Canvas Tarpauling, 1*s.* per square yard; thick Canvas Waxed Sheeting, 1*s.* per square yard, may be had various widths. These Canvases are excellent for roofing Sheds and Outhouses, as they are quite waterproof.—R. RICHARDSON, 21, Tonbridge Place, Judd Street, New Road, London. N.B. Waterproof Capes, large size, 3*s.*; Police Capes, 18*s.* and 24*s.* per dozen; Driving Aprons, Capes, and Coats of India Rubber, Horses' Loin Cloths, Waggon and Cart Covers, Sacks, &c.

B. SAMUELSON (LATE JAMES GARDNER),

BRITANNIA WORKS, BANBURY,

AND AT

IMPLEMENT STANDS, 57, 58, 59, 60, 61, 62, and 63, SMITHFIELD CATTLE SHOW.

SAMUELSON'S PATENT FORKING AND DIGGING MACHINE

Has been awarded the Royal Agricultural and numerous County Prizes.

SAMUELSON'S GARDNER'S TURNIP CUTTERS,

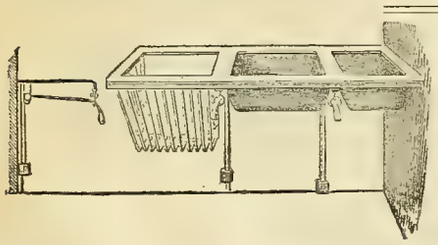
With new PATENT DIRT REAPING PLATE, received the First Prize of the Royal Agricultural Society at Lincoln, and at all the Royal Agricultural Society's Shows from 1844.

Economical Chaff Cutters
Corn Bruising Mills
Oilcake Breakers
McCormick's Reaping Machines
Registered Budding's Lawn Mowers
Patent American and Atmospheric Churns
Patent Force Pumps for Farm Use
Field Rollers, &c. &c. &c.

Illustrated Catalogues and other particulars may be had of any Ironmonger or respectable Implement Dealer in town or country; at Stands 57 to 63, Smithfield Cattle Show, or free by post of

B. SAMUELSON, Britannia Works (late Gardner's), Banbury.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.



COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, as one Fixture, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest.

COTTAM'S ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.

IMPROVED PUMPS,

OF THE BEST WORKMANSHIP AND WARRANTED.

The VALVES and SUCKERS of these Pumps are constructed upon an entirely new and SIMPLE principle; they are not likely to get out of order; should they do so, can easily be repaired, as the Pump is so contrived that the valves can readily be got at.

An Improved CAST IRON TRAP, strongly recommended by the Sanitary Commissioners, and suitable for Sugar Bakers, Slaughter Houses, &c. &c. It is so formed that the Trap-plate will pass any matter the top grating will let through, and therefore is not liable to stoppages; and well adapted to Stables and Stable-yards, for saving the best part of Liquid Manure.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

THE MOST APPROVED STOVES.—The demand for the CHUNK and VESTA STOVES (separately patented), still continuing unabated, and numbers having been sold last season (in all upwards of 14,000) through the patronage of families who have had experience of their pre-eminently useful qualities, WILLIAM S. BURTON has renewed confidence in recommending them for their cleanliness, economy, and safety. During the last 13 years they have been found sources of great comfort in the bedroom of the invalid, affording an uniform temperature throughout the day and night, with one supply of fuel, without attention. Particulars sent postage free. Chunk, 30s. to 50s.; Vesta, from 35s.; Stoves for Warehouses, &c., from 10s. each. Joyce's Patent Fuel, 4s. 6d. per sealed bag.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

39, OXFORD STREET (corner of Newman Street); Nos. 1, & 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads, 18s.; Portable Folding Bedsteads from 12s. 6d.; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21s.; and Cots from 21s. each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2l. 19s. to 13l. 13s.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from all the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are now ON SHOW in one of his TEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz. from 12s. 6d. (two lights) to 16l.

LAMPS OF ALL SORTS AND PATTERNS.—The largest, as well as the choicest, assortment in existence of FRENCH and ENGLISH MODERATEUR, PALMER'S, CAMPHINE, ARGAND, SOLAR, and other LAMPS, with all the latest improvements, and of the newest and most *recherché* patterns, in ormolu, Bohemian, and plain glass, or papier-mâché, is at WILLIAM S. BURTON'S, and they are arranged in one large room, so that patterns, sizes, and sorts can be instantly selected.

Real French Colza Oil, 4s. 9d. per gallon.

Palmer's Candles, 9d., 9½d., and 10d. per lb.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as highly conducive to health and longevity. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTIFRICE, stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, it will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the teeth firmly in their sockets; and from its aromatic influence imparts sweetness and purity to the breath.—Price 2s. 9d. per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by chemists and perfumers.

KNOW THYSELF!—The secret art of DISCOVERING the TRUE CHARACTER of INDIVIDUALS from the peculiarities of their HANDWRITING, has long been practised by ELLEN GRAHAM with astonishing success. Her startling delineations are both full and detailed, differing from anything hitherto attempted. All persons wishing to "know themselves," or any friend in whom they are interested, must send a specimen of their writing, stating sex and age, enclosing 13 penny post stamps to Miss GRAHAM, 3, New Road, Hornsey, Middlesex, and they will receive in a few days a minute detail of the mental and moral qualities, talents, tastes, affections, virtues, failings, &c., of the writer, with many other things hitherto unsuspected.—"Miss GRAHAM is a most successful graphiologist." *Family Herald.*

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, MOUSTACHES, &c.?—ALICE MELVILLE'S PALMAPILLA in all cases strengthens weak hair, prevents its falling off, checks greyness, produces a thick and luxuriant growth, dispels scurf and dandriff, and makes it clean, soft, curly, and brilliant in appearance. For baldness from any cause it is certain and effective; and for the production of Whiskers, Moustaches, Eyebrows, &c., in three or four weeks, it can be fully depended upon. Price 2s., sent post free (anywhere) on receipt of 24 penny postage stamps, by Miss MELVILLE, 25, Argyle Square, King's Cross, London. —"My whiskers are growing very thick." R. Mede, Esq.—"It restored my hair, which I had lost in patches." W. Sturt.—"It has quite checked the greyness." Miss Ellis.—"My Moustache is greatly improved." Capt. Ross.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, &c.?—COUPELLE'S CRINUTRIAR though extensively imitated, is universally acknowledged as the only preparation to be really depended upon for the unfailing production of Hair and Whiskers in two or three weeks; as also checking Greyness, Baldness, &c., and rendering the Hair beautifully luxuriant, curly and glossy. Mr. WILLIAMS, 8, Lowther Street, Liverpool.—"I can now show as fine a head of hair as any person, solely from using your Crinutriar." Sergeant CRAVEN, Longford Barracks, Ireland.—"Through using your Crinutriar, I have an excellent Moustache, which I had before despaired of." Mrs. CARTER, Pangbourne, Berks.—"My head, which was quite bald, is now covered with new hair." Price 2s. per Bottle, and four times the quantity at 6s. each, through all Druggists and Perfumers, or of ROSALIE COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

DERBY BURIAL BOARD.

TENDERS FOR TREES AND PLANTING.

WANTED, by the Derby Burial Board, TENDERS for PROVIDING and PLANTING TREES in the NEW CEMETERY adjoining the Nottingham Road, Derby. The plan and specification may be seen at the Clerk's Office, 14, Full Street, Derby, after Thursday, the 30th inst. Sealed Tenders addressed to "The Chairman of the Derby Burial Board," marked "Tender for Planting, &c.," must be delivered at the Clerk's Office, not later than 12 o'clock at noon, on Thursday, December 14. JOHN WALKER,

November 21. Clerk to the Board.

TO FLORISTS, FRUITERERS, & GREENGROCERS.

TO BE LET, a BUSINESS in the above line within 4 miles of town; capital Shop, Conservatory, and Greenhouse, all in excellent working order. The situation is highly respectable, and for a clever man it is a most desirable opportunity. Coming-in moderate.—For particulars apply to Mr. C. BROWN, House and Estate Agent, Westcroft Place, Hammersmith

TO BE LET, with immediate possession, 180 Acres, or, if desired, 230 Acres of highly productive ARABLE and PASTURE LAND, well situated, in the county of Essex, together with excellent Dwelling-house, Bailiff's and other Cottages, commodious Barns, Stables, and requisite Outbuildings. This eligible occupation is worthy of the attention of a first-class farmer; the lands are in good condition, being now and for many years in the hands of the proprietor.—For rent and particulars, apply to Mr. PARTRIDGE, Land Agent, Great Braxted Hall, Witham, Essex.

THE BEST AND CHEAPEST FOOD FOR PIGS, ETC.

PIG RICE, 9l. per ton; 10s. per 112 lbs., in bags, containing 168 lbs., fattens Pigs more quickly than Barley—only requires boiling.—WILSHERE & Co., 2, Talbot Court, Gracechurch Street, London.

ALDERNEY BULL.—A Clergyman has a very fine Bull of the above breed for sale, 14 months old, and very strong and handsome.—Apply to Rev. F. H. L., Merevale, Atherstone.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

THE PLANTING SEASON.

WM. URQUHART AND SONS, Dundee, respectfully intimate that their PRICED LIST may now be had on application.

MESSRS. TOPFS AND CO., of Erfurt, Prussia, announce that their CATALOGUE of CHOICE FLOWER SEEDS, grown by themselves, will be ready for distribution to the Trade on and after December 7.—Mr. WILLIAM HASLAM, Epping, Agent for Great Britain and France.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

GEORGE JACKMAN begs to announce that he has just published a new and complete CATALOGUE of his Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.

Woking Nursery, 1½ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—December 2.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

BASS AND BROWN'S NEW AUTUMN CATALOGUE, supplied free for three Penny Stamps. They have this season a very fine and vigorous stock of the finest Roses, among which are a number of very superb new Continental varieties, consisting chiefly of the perpetual class. The following selections will be highly approved,

ROSES.

100 Standards in 100 very superior varieties ...	...	£7	10 0
100 " 50 " " ...	...	6	10 0
50 " 50 varieties ditto, all selected from perpetuals	...	4	0 0
100 dwarfs and half standards, or all dwarfs, in 100 very superior varieties	...	4	0 0
100 ditto in 50 varieties, ditto	...	3	0 0
50 ditto in 50 varieties, ditto, all from perpetuals	...	2	10 0
Fine mixed dwarfs, per 100	...	1	10 0

Hardy Herbaceous Plants, Hollyhocks, prize-named Gooseberries, Strawberries, Standard Dwarf and Trained Fruit Trees, Flower Roots, and a variety of desirable articles offered in selection for present planting, for which see *Gardeners' Chronicle*, Oct. 14, page 659, and Oct. 28th, page 690.—Goods, carriage free (not under 20*s.*), to all the London termini, and all Stations on the London and Norwich Colchester Line. Plants added gratis with orders of 40*s.* and upwards.

Seed and Horticultural Establishment, Sudbury, Suffolk.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4*s.* per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s.* per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s.* per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

NEW CLIMBING HYBRID PERPETUAL ROSE, THE "DUCHESS OF NORFOLK."—Colour, Vivid Crimson. Sent out for the first time about the end of October.

WILLIAM WOOD AND SON beg to refer to their advertisement in the *Gardeners' Chronicle* of September 30, page 627. Standards, half-standards, or dwarfs will be supplied at 10*s.* 6*d.* each, with the usual allowance to the trade.

N.B. When six plants or more are ordered by the trade, a very considerable reduction will be made beyond the usual discount, particulars of which may be had on application.

A Drawing of the above may be had for 6 Postage Stamps.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

ROSES.

WILLIAM WOOD AND SON, having a large stock this season, beg to offer fine strong Plants of the following kinds of HYBRID PERPETUAL ROSES, budded on fine selected stocks, from 4 to 6 inches, well suited either for potting or for planting in masses in the Rose Garden.

AT 15*s.* PER DOZEN (when one dozen of a kind is ordered):—Auguste Mie, Baronne Hallez, Baronne Prevost, Charles Boissière, Duchess of Sutherland, Duplessis Mornay, Egérie, Géant des Batailles, Jaques Lafitte, La Reine, Le Lion des Combats, Louise Odier, Madame Trudeaux, Pius the Ninth, Reine des Fleurs, Robin Hood, &c. &c. &c. Pius the Ninth is particularly recommended as a pillar Rose of extraordinary growth, budded plants of this kind in the Woodlands Nursery having made shoots from 5 to 6 feet in length this season, and flowers until very late in the year.

AT 10*s.* PER DOZEN (Hybrid Perpetual Roses):—Augustine Mouchelet, Duc d'Aumâle, Lady Fordwich, Madame Laffay, Marquise Boccella, Marquis of Ailsa, Mrs. Elliot, Prudence Rœser, William Jesse, &c.

N.B. The Trade supplied on liberal terms. Catalogues may be had in exchange for two postage stamps.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to announce that they are now sending out the following new Plants:

HELIOTROPIUM, BEAUTY OF THE BOUDOIR; the best for Garden and Pot Culture.

CHRYSANTHEMUM, ANNIE HENDERSON; the summer flowering variety; colour yellow, and form of Annie Salter; very dwarf.

GERANIUM, PRETTY POLLY; the loveliest hybrid bedding Geranium; colour, orange salmon.

ACHIMENES HENDERSONI; the newest and prettiest hybrid variety out.

FANCY GERANIUMS: CLOTH OF SILVER, EVENING STAR, and CRYSTAL BEAUTY; for form, colours, and general good qualities unequalled.

CINERARIAS: MRS. ROGERS, MRS. GERARD LEIGH, FASCINATION, and PRINCE OF PRUSSIA. (No further orders can be executed for Mrs. Rogers and Mrs. Gerard Leigh until next spring.)

See Autumn Catalogue for full descriptions, price, &c. &c.

The NEW RHODODENDRONS discovered on the Bhootan Alps, by THOMAS J. BOOTH, Esq., surpassing in magnificence of flower the Sikkim species. Full particulars of them will be seen on reference to their Spring Catalogue.

SPLENDID NEW RHUBARB.

SALT'S CRIMSON-PERFECTION.

ROBERT SALT begs leave to inform the Gentry, Nurserymen, Gardeners, &c., that this splendid variety of Rhubarb is now ready for distribution. It is universally allowed to be the most early, prolific and delicious variety ever offered to the Public.

See *Gardeners' Chronicle* June 11, 1853: "Very good, and of a most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."—ED.

Certificates of Merit were awarded for specimens exhibited at the Meeting of the Horticultural Society, Regent Street, London, June 28th, 1853—at Nottingham, May 24th, 1854—at Derby Midland, May 25th, 1854—at Ormskirk, Lancashire, August 30th, 1854. Price 7*s.* 6*d.* per root, 3 for one guinea, and 6 for 2*l.*

Orders addressed to ROBERT SALT, Longton, Staffordshire; or the following agents, will have immediate attention: Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London; Messrs. BURGESS & KENT, Penkhull, Staffordshire; Mr. WOOD, Nurseryman, Coppice, near Nottingham; Messrs. FRANCIS & ARTHUR DICKSON, East-gate Street, Chester; Mr. SALISBURY, Melbourne, Derbyshire. A liberal discount allowed to the trade. A Post-office order from unknown correspondents.—Longton, Dec. 2.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

FIVE HUNDRED BUSHELS OF POTATOES TO THE ACRE.—This enormous crop was grown this year by a gentleman in Surrey, and out of which there were only 5 bushels diseased; nearly all the quantity were large sized, some weighing 2 lbs. and 1 oz., and not above 30 bushels of Chats out of the whole. This Potato was originally reared in Scotland, and is called by its grower the Scottish Champion. It is a good baker and boiler. Price 2*l.* 2*s.*, inclusive of the sack of 3 bushels, delivered free at the South Western Railway station in London. Early application is necessary, as only a few sacks are for sale, the party growing intending to plant largely next season. A reference as to the quantity and quality can be given in the neighbourhood.—Apply by letter, post-paid, to B. S., 4, Crooked Lane, London Bridge.

All orders must be accompanied by a remittance.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1*l.*—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & CO.'s Sanatorium, 46, Leicester Square.

FORD'S EUREKA COLOURED SHIRTING is now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.

FORD'S COLOURED EUREKA SHIRTS, Six for 27*s.*

FORD'S WHITE EUREKAS, best quality, Six for 40*s.*; second quality, Six for 31*s.*; if washed ready for use, 2*s.* extra.

CAUTION.—Ford's Eureka Shirts are stamped, "8S, POULTRY, LONDON," without which none are genuine.

*** Catalogues with particulars post free.

RICHARD FORD, 38, Poultry, London.

NOTICE.

OVER-COATS, CAPES, &c.—One of the largest stocks in London of every description, first-class garments, at lowest charges; also of Youth's ditto, all made thoroughly impervious to rain, without extra charge, or made to order at a day's notice.—W. BERDOE, 96, New Bond Street, and 69, Cornhill (only).

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge.

ESTABLISHED A.D. 1700.

TEN THOUSAND STOVES.

THE TENTH THOUSAND OF THE PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, AND CO., 46, King William Street, London Bridge; and may be obtained of most Ironmongers.

The IMPROVED PATENT VENTILATING STOVE, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded post free.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES.—METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & CO.'s only Establishment, 130B and 131, Oxford Street, second and third doors west from Holles Street.

VISITORS TO THE SMITHFIELD CATTLE SHOW are invited to inspect BREIDENBACH'S PERFUMERY WAREHOUSE, 157B, New Bond Street, where will be found a choice collection of elegant Presents, Christmas, and New Year's Gifts. The GUINEA CASE OF PERFUMERY contains every requisite for a lady's or gentleman's toilet, including two bottles of choice perfume for the handkerchief, a glass jar of prepared cream for the hair, a sachet of ground dried flowers, a bottle of smelling salts, or Vinaigrette, a china pot of lip-salve, a jar of rose cold cream, a box of Odonto tooth powder, and a bottle of rose-scented Eau de Cologne. Also a neat case fitted in the same way, 10*s.* 6*d.* each. Real Eau de Cologne, 10*s.* case of six bottles, or 2*s.* singly.

157B, New Bond Street, London.

BIRMINGHAM CATTLE AND POULTRY SHOW.—TESTIMONIAL TO MR. T. B. WRIGHT.—At a meeting of gentlemen desirous of raising a fund for the purpose of presenting a Testimonial to Mr T. B. Wright, in acknowledgement of his important services in originating the Birmingham Cattle and Poultry Show, and the valuable assistance he has contributed towards its management, held at the house of Mr. Jeremiah Mathews, on Friday, the 24th November, 1854, Mr. J. Mathews in the chair; present—Howard Luckcock, Esq., W. Mathews, Esq., Messrs. John Shackel, John Lowe, Benjamin Dain, John Harlow, Joseph Jennens, and John Morgan, jun., it was resolved—

That Subscription Lists be forthwith opened, and that the Gentlemen now present be a Committee, with power to add to their number, for the purpose of carrying out the object of the Meeting.

That Howard Luckcock, Esq., be the Chairman of the Committee; Mr. Shackel, Treasurer; and Messrs. John Lowe and John Morgan, jun., Joint Secretaries. J. MATHEWS.

Subscriptions to the fund will be received by the Treasurer, Mr. John Shackel, Blenheim House, Small Heath; Mr. John Lowe, of the firm of Mapplebeck and Lowe, Bull Ring, Birmingham; Mr. John Morgan, jun., Cattle Show Offices, 3S, Bennett's Hill; and by the Bankers, Messr. Attwoods, Spooner, & Marshalls, New Street, Birmingham.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 37, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, December 2, 1854.

HORTICULTURAL SOCIETY OF LONDON, 21, REGENT STREET.—Notice is hereby given that the New SCHEDULE of REWARDS offered to Exhibitors at the Society's Meetings in 1855, both in Regent Street and at the Garden, will shortly be issued. In the meanwhile intending exhibitors may obtain incomplete copies gratis upon application at this Office. (By Order,) WILLIAM BEATTIE BOOTH.

THE BRITISH POMOLOGICAL SOCIETY meets at the rooms, 20, Bedford Street, Covent Garden, London, on the first MONDAY of every month, to receive communications respecting Fruits and Fruit Trees, for the Election of Members, and for General Business.

All communications and packages containing specimens of Fruits, to be addressed to ROBERT HOGG, Secretary.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Notice is hereby given that the Annual General Meeting of the Members of this Society will take place at the Horticultural Rooms, No. 21, Regent Street, for the purpose of receiving the Accounts of the Society for the past year, and Electing Officers for the ensuing year. An Election of Three Pensioners will afterwards take place from among the following Candidates, whose testimonials have been examined and approved by the Committee:—

No person will be allowed to Vote whose Subscription for the Year 1854 is unpaid on the day of Election.

By order of the Committee,
Dec. 8, 1854. E. R. CUTLER, Secretary.
14, Tavistock Row.

GARDENERS' BENEVOLENT INSTITUTION.
FOURTH APPLICATION.

WILLIAM THACKER begs earnestly to appeal to the subscribers, through the medium of an advertisement, from his total inability to incur, for the FOURTH TIME, the heavy expense of issuing circulars. He is aged 68, and he rests his claim to their benevolence on having been 50 years a gardener and five years a subscriber to the Institution; and that both his wife and himself are totally incapacitated, through infirmity, from supporting themselves. His case is strongly recommended by Mr. Alex. Dancer, Fulham; Messrs. J. & C. Lee, Hammersmith; Mr. T. Gaines, Battersea; Mr. Barto Chaundy, Lewisham.

COLLECTION OF PEARS.—The Collection of nearly 100 Pears exhibited by RENE LANGELIER at the Society for the Encouragement of Horticulture may be seen for a few days at Dungannon House, Fulham, where orders for the trees will be taken by Mr. GLENNY, Horticultural Agent, Auctioneer, and Valuer.

CHRYSANTHEMUMS.

HUGH LOW AND CO. have to offer extra fine well-shaped blooming Chrysanthemums, both Pompone and large flowering, at 9*s.* per dozen. The plants are large, well-grown, and unusually well furnished with flower buds.
Clapton Nursery, London.

HOLLYHOCK SEED.

R. PARKER has now ready for sending out Seed of this year's saving from the finest named varieties in cultivation, in packets at 1*s.* and 2*s.* 6*d.* each. A remittance or reference to accompany all orders from unknown correspondents.
—Paradise Nursery, Hornsey Road, London.

DILCOCK'S BRIDE BROCCOLI.
SIXPENCE PER PACKET.

BAINBRIDGE AND HEWISON (Proprietors of this far-famed Broccoli), beg to inform their friends and customers that they are prepared to send it out this season from selected stock of their own growth. The trade can have price on application, and early orders are respectfully solicited.
York Nurseries, Dec. 9.

EXOTIC NURSERY, CHELSEA.

JAMES VEITCH, JUN., will be happy to forward his new Retail VEGETABLE, AGRICULTURAL, AND FLOWER SEED LISTS on application, and desires to assure those who may kindly favour him with their orders, that he has spared no pains in procuring his supplies from the first growers on the Continent as well as in this country, and that he will use his best endeavours to give his customers entire satisfaction.

VICTORY OF BATH MELON (TRUE).
THE BEST FOR EARLY FORCING.

J. SALTER has a few SEEDS of this excellent MELON to dispose of. A packet forwarded on receipt of 13 postage stamps.—Ampthill Nursery, Hampstead Road, London.

CAMELLIAS.

CHANDLER AND SONS beg to inform their friends and customers that they have a large stock of young CAMELLIAS this season, beautifully set with flower buds, and now in a fit state to travel without injury. Fine bushy Plants 30*s.* and upwards per dozen.—Wandsworth Road, Vauxhall.

THE PRINCE ALBERT PEAR.—This fine late Pear is like the Beurré Rance, but is hardier, and in general keeps longer. Young healthy trees, on the Pear and on the Quince stock, on which it grows freely, 5*s.* each—prepaid to London.
THOMAS RIVERS, Nurseries, Sawbridgeworth.

HALF STANDARD PEACHES, NECTARINES, AND APRICOTS IN POTS.—In addition to the dwarf trees in pots of Peaches, &c., the above can be supplied of the leading varieties; they have well ripened shoots full of bloom buds, and straight stems about 3 feet in height. The Apricots of one kind, the Peach Apricot, are 4 feet in height, and are also full of bloom buds. The above are well adapted for Orchard-houses with high roofs. Price 5*s.* each.
THOMAS RIVERS, the Nurseries, Sawbridgeworth.

NOTICE.—WILLIAMS' EVERGREEN CLIMBING ROSE.

WM. WOOD AND SON beg to announce that they are unable to supply any more plants of WILLIAMS' CLIMBING ROSE at present; they will, however, be ready to execute orders for the same in the spring with well established plants. Any orders received after this date for the above Rose will be carefully filed and executed in the spring. Notice of the time when the plants will be ready will be duly announced in the *Gardeners' Chronicle*.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.—Dec. 9.

NEW CHRYSANTHEMUMS OF 1854.

Aurore boreale	Louis Delaborde	Dr. Bois
Auguste Mie	Bob	Eclipse
Comte Achille Vigier	Indiana	Marguerite de Valois
Zebra	Hermine	" de Wildemar
Pluie d'Or	Furris Eburnea	Juanita
		Duval

MESSRS. E. G. HENDERSON & SON beg to announce that the above choice varieties, flowered for the first time in this country, can now be seen in their winter garden, at the Wellington Nursery, St. John's Wood, London.

NEW PERPETUAL STRAWBERRY.
"DELICES D'AUTOMNE."

A. VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer the new and Perpetual Strawberry "DELICES D'AUTOMNE." The fruit is large, delicious, and very abundant; it is certainly the best perpetual Strawberry of all. A correct drawing will appear shortly in Verschaffelt's "L'Illustration Horticole." Price, per plant, 2*s.* 6*d.*; six plants, 10*s.* 6*d.*

SUTTON'S EARLY CHAMPION PEA, WAITE'S DANIEL O'ROURKE, SANGSTER'S No. 1, FAIRBEARD'S NONPAREIL, *and all other new sorts of Seeds, may be obtained genuine, by retail, at the Grower's retail prices, from*
SUTTON & SONS, Seed Growers, Reading, Berks.

FAIRHEAD'S "EARLY CONQUEROR PEA."
To be had wholesale and retail of CLARKE and Co., Seedsmen, 86, Borough, London.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

NONPAREIL PEAS.

WILLIAM FAIRBEARD begs to inform the trade that he is now ready to execute any orders he may be favoured with. This Pea W. F. is confident will become a general favourite both for Garden and Field culture. Price can be had on application.—Mount Pleasant Nursery, Queen Street, Sittingbourne, Kent.

OMER PACHA PEA.

W. NICOL, GARDENER, Roslyn House, Hampstead, begs to announce that he has put his incomparable Pea "OMER PACHA" into the hands of Mr. SOMMERVILLE, Landscape Gardener, Nurseryman, &c., Garden Road, St. John's Wood, London, for Sale in sealed quarts at 10*s.* 6*d.*; and pints, 7*s.* 6*d.* The above Pea is not only the earliest, but the most prolific and best-flavoured hardy variety in cultivation. As the Stock is small, W. NICOL would recommend immediate application to Mr. Sommerville, as above.

SEED GROWERS' SOCIETY.—The Members of the above Society are now prepared to send LISTS of AGRICULTURAL, GARDEN, and FLOWER SEEDS to those who are desirous of having them genuine and direct from the Growers.—Applications addressed to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex, will meet with prompt attention.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s.* per doz.; HOWARD'S PRINCE ALBERT, 12*s.* per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford, Dec. 9.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s.* per lb. smaller quantities 2*s.* 6*d.* per oz. No orders attended to for less, quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

LILIUM LANCIFOLIUM.

HENRY GROOM, Clapham Rise, near London, by appointment, FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that this is the best time to have Bulbs of the different varieties of this most BEAUTIFUL LILY. They are well adapted for the Flower Garden, American Borders, and Drives in Parks, being quite hardy. His Catalogue may be had on application.

BULBS.

JOHN WEEKS AND CO. beg to intimate that they still have on hand a considerable Stock of DUTCH and other BULBS. They are in excellent condition; and being imported direct from the Grower, can be supplied at the following reasonable quotations, viz.:—

HYACINTHS, single and double, of the
finest named varieties ... 8*s.*, 12*s.*, 15*s.* per doz.
" fine mixtures for borders ... 30*s.* per 100.
CROCUS, of the best sorts ... ... 2*s.* 6*d.* & 3*s* 6*d.* "

Also selections of Narcissus, Jonquil, Tulip, Amaryllis, Gladiolus, Anemone, Lilium, Ranunculus, &c., on terms equally reasonable. N.B.—A Seed Catalogue is in course of preparation, and shortly will be furnished on application.
King's Road, Chelsea, Dec. 9.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

TO THE SEED TRADE.

ABRAHAM HARDY AND SON, SEED GROWERS, beg to announce that their Wholesale Priced CATALOGUE of SEEDS, growth 1854, is now ready, and may be had on application.—Maldon, Essex, December 9.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.
P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

WANTED, PEAR STOCKS and MANETTI ROSES. Size and price per 100, with quantity to offer, may be addressed to Messrs. HURST & M'MILLEN, 6, Leadenhall Street, London.

DWARF PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

EDWARD PARKE FRANCIS offers a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application. Strong Trees, showing Fruit Buds, 2*s.* 6*d.* to 3*s.* 6*d.* each.
Rose Nurseries, Hertford.

FINE TRAINED FRUIT TREES IN A BEARING STATE.

LUCOMBE, PINCE, AND CO., have this season for Sale a remarkably healthy stock of fine trained FRUIT TREES of all the best sorts, to which they respectfully beg to call immediate attention. Prices and particulars to be had on application to LUCOMBE, PINCE, & CO., Exeter Nursery, Exeter.
ESTABLISHED 1720.

FOREST AND ORNAMENTAL TREES AND SHRUBS.

DAVID REID AND SON, NURSERYMEN AND FLORISTS, Leith Walk, Edinburgh, beg to intimate their CATALOGUES as above are ready, and to be had free on application.

LARGE FIRS AND FOREST TREES.

MESSRS. WILLMOTT AND CHAUNDY, of Lewisham, have to dispose of, at low prices, in consequence of the ground (12 acres) having to be cleared for building on, a quantity of large FOREST TREES and FIRS of various kinds; they will come up with good roots.
They have also an extensive stock of large well-grown Evergreens of various sizes, that will come up with good balls.

TO GENTLEMEN, NURSERYMEN, PLANTERS, ETC.

J. SELFE begs to announce that he has a large stock of SPRUCE FIR from 2 to 8 feet high. LAURELS from 2 feet 6 inches to 8 feet. Box, Hollies, Yews, Rhododendron Ponticum, Laurestinus, &c. To be disposed of at moderate prices, as the ground is required for building purposes.
Surbiton Hill, Kingston, Surrey, Dec. 9.

FRUIT TREES, FOREST TREES, EVERGREEN SHRUBS, &c. Catalogues of the above may be had on application to WILLIAM BARRATT, Wakefield.
☞ A quantity of fine Transplanted White Thorns.

MANGOLD WURZEL SEED.

TO BE SOLD, LONG RED and YELLOW GLOBE, this year's seed, from superior stock.—Apply to R. S. HEWS, Kelvedon, Essex.

TO BE SOLD, at very reduced prices, 10,000 very strong 2, 3, and 4-year old GOOSEBERRIES and CURRANTS, of the best sorts.—For further particulars, apply to LAKE & DYER, Nurserymen, Bridgewater.

CEMETERIES.

MESSRS. MAJOR AND SON having been repeatedly asked whether the laying-out of Cemeteries falls within their province, beg to announce publicly that they consider it does strictly fall within their province as Landscape Gardeners, that they have directed especial attention to it, and have the arrangement of several at the present time, and, therefore, beg respectfully to offer their services to all who are in any way concerned in the formation of Cemeteries.—Knosthorpe, near Leeds.

FLUKE KIDNEY POTATOES

FLUKE KIDNEYS, per bushel of 56 lbs. ... ... 7*s.*

		Scotch Cups „	6*s.*

Package and delivery in London, 9*d.* per bushel, and 2*s.* per sack.
Newington Butts, London.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS.

THIS highly VALUABLE PREPARATION preserves POTATOES, WHEAT, and all other GRAIN, from the RAVAGES OF DISEASE. The CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regent's Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.
"G. B. BAXTER.
"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.
"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c., JOHN SHANKS,
"Forester, Kildrummy Castle.
"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.
"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.
"T. AUSTEN, Nurseryman and Seedsman.
"Blackheath, Kent, 24th August, 1854."

Sold by all Seedsmen and Chemists, and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

THE NEW CHINESE POTATO (DIOSCOREA JAPONICA).

MR. JOHN HENDERSON,

Formerly of the Firm of JOHN A. HENDERSON & Co., Pine Apple Place, London,

HAS the pleasure of informing the Public that he has just completed the Purchase from M. PAILLET, of Paris, of his entire Saleable STOCK of the above introduction from China, the nutritive properties of which are said so far to surpass the ordinary Potato that it is likely, not only to act as an auxiliary, but entirely to SUPERSEDE that valuable but uncertain esculent.
The most satisfactory results have followed from personal experiments, and proved that when cooked in the ordinary manner, from the large amount of FARINACEOUS properties it contains, it can NEVER become WAXY, as is too generally the case with the Potato. Its FLAVOUR resembles in delicacy an early ASH-LEAVED KIDNEY; but, independent of the above excellent qualities, there is every probability of its taking a still more important position in the ECONOMY of this country, for, when dried and reduced to powder, it is equal to the best ARROW-ROOT; or mixed in the proportion of one-third with two-thirds of wheaten flour, it makes an extremely light and wholesome BREAD, as well as very superior PASTRY.

Messrs. VILMORIN & Co., speaking of it, observe:—"Of all the esculent roots proposed as substitutes for the diseased Potato, the DIOSCOREA JAPONICA is certainly the only important one. It is easily propagated. The tubers are large and long, the flesh very mealy and devoid of any peculiar or disagreeable flavour. The DIOSCOREA JAPONICA is, in our opinion, a PRECIOUS ACQUISITION."

M. PELÉ, Horticulturist, Paris, in his Supplementary Catalogue of this autumn says:—"A new alimentary root, introduced into France by M. MONTIGNY, French Consul in China. Serious experiments have shown that this tuber will be much more advantageous to cultivate than the Potato, both in regard to its QUALITY as well as PRODUCE."

M. PAILLET, to whom the Imperial Society of Agriculture and Commerce of France has awarded the sum of 3000 francs as encouragement for having brought it into cultivation, also notices that "this tuber attains at least 1 to 2 lbs. weight. In its growth it is less delicate than the Potato, which unfortunately has of late years much degenerated. It does not require particular care, and its abundant produce amply repays cultivation. Its taste is pleasant, and being a root which contains a large amount of FARINA, will be a great addition to the FOOD OF THE PEOPLE as soon as it becomes generally known. It is so HARDY that it has passed the winters of 1853–4 in the open ground, without having in the least suffered from frost. It is also found that the STEMS and LEAVES, which are very numerous, form an EXCELLENT FOOD FOR CATTLE."

Tubers, with description of the Chinese Mode of Culture, to be obtained of MR. JOHN HENDERSON, KINGSKERSWELL, SOUTH DEVON, at the following prices, for cash only:—
4 Tubers ... ... £0 10 0 | 10 do. ... ... £1 2 6 | 50 do. ... ... £5 5 0 | 100 do. £10 0 0
Post-office orders are requested to be made payable at Newton Abbot, South Devon. The usual discount allowed to the trade when not less than 50 are taken.—P.S. All orders unaccompanied by a remittance will be considered as not received.

CUCUMBER AND MELON SEED.

THE FOLLOWING SORTS MAY BE HAD OF

JOHN CATTELL, NURSERIES, WESTERHAM, KENT.

CUCUMBERS.

BELLEGARDE...	Early	Round	Yellow	Green	5 to 8 lbs.	Beautifully quartered, good flavoured.
BROMHAM HALL	Late	Round	Greenish white	Green	3 to 4 lbs.	Good.
CANTALOUP	Early	Round	Yellow	Scarlet	2 to 4 lbs.	Excellent for preserving. [sugary.
LARGE OVAL...	Late	Oval	Greenish yellow	Green	5 to 7 lbs.	Requires keeping after being cut, very
MONTREAL	Late	Round	Green	Green	3 to 4 lbs.	Excellent flavour, beautifully netted.
SEREPTA	Early	Oval	Greenish yellow	Green	3 to 4 lbs.	Very good. [very best and earliest.
TRENTHAM HYBRID (Persian) ...	Early	Oval	Yellow	White	2 to 3 lbs.	Thin rind, high flavoured, one of the
VICTORY OF BATH	Early	Oval,	Greenish yellow	White	3 to 5 lbs.	Thin rind, one of the earliest.

ABRAHAM HARDY AND SON, SEEDGROWERS AND SEEDSMEN, Maldon, Essex.—Best and earliest selected SEED POTATOES, round or kidney varieties, warranted free from disease, at 2*s.* 6*d.* per peck, or 7*s.* 6*d.* per bushel of 56 lbs.; Ash-leafed, 10*s.* per bushel, or 3*s.* per peck. Also remarkable sound SEEDLINGS, raised from Seed of the earliest selected varieties 1854, numbering about 1000 Tubers in a peck, sufficient to plant 7½ rods at 1 foot by 2 feet apart, warranted to produce a full and early crop at a small cost, by the directions to be given for planting. Price 4*s.* per peck, new sacks or bags for all included, and carriage paid to London, or to any station on the Eastern Counties, or Eastern Union Railways, except for quantities less than a peck. A 6*d.* Packet of 4000 genuine selected POTATOE SEEDS, early or late, round or kidney, free by post, directions for sowing, &c. Early applications solicited. Remittances requested.

EARLY SEED POTATOES.—Jackson's Improved Thorough High-bred Early Ashleafs, price 9*s.* per bushel, and the celebrated Short-tops, 7*s.* 6*d.*, are unequalled for quality and yield; they by far surpass the "old stock," which is generally a sluggish bearer. British Queens, 7*s.* 6*d.*, the earliest round variety, known; Early Frame and Ashleaf Seedlings, 8*s.*; Regents, from prepared cuttings, 6*s.* Free to London; no charge for sacks. JOSEPH WILSON, Seedsman, Ipswich.
The grower of the new Mammoth variety, "Lord Raglan," has on hand a few sacks of the medium size, which he is willing to dispose of, price 2*l.* 2*s.* per sack. Parties who were too late for the first lot are requested to apply again.

FIVE HUNDRED BUSHELS OF POTATOES TO THE ACRE.—This enormous crop was grown this year by a gentleman in Surrey, and out of which there were only 5 bushels diseased; nearly all the quantity were large sized, some weighing 2 lbs. and 1 oz., and not above 30 bushels of Chats out of the whole. This Potato was originally reared in Scotland, and is called by its grower the Scottish Champion. It is a good baker and boiler. Price 2*l.* 2*s.*, inclusive of the sack of 3 bushels, delivered free at the South Western Railway station in London. Early application is necessary, as only a few sacks are for sale, the party growing intending to plant largely next season. A reference as to the quantity and quality can be given in the neighbourhood.—Apply by letter, post-paid, to B. S., 4, Crooked Lane, London Bridge, where samples may be seen, and the name of the grower given.
All orders must be accompanied by a remittance.

GREAT NOVELTIES FOR THE ENSUING SEASON,

FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—
FLORENCE NIGHTINGALE—Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.
GALANTHIFLORA-PLENA—(The DOUBLE Snowdrop Corolla'd Fuchsia)—Pure double white corolla, resembling a fine large double snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced.
Price 10*s.* 6*d.* each. The usual discount to the Trade when three or more are taken.
Exeter Nursery, Exeter; established 1820.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.	Pinus canadensis, 3 to 8 feet
Cedrus Deodara, in any quantity, from 1 to 3 feet high	Cupressus macrocarpa or Lambertiana, 4 to 7 feet
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants	„ thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Cedars of Lebanon, 3, 4, 6, and 10 feet high	Juniperus, Upright Irish, perfect columns, 3 to 7 feet
Pinus Douglasi, 3 to 10 feet	„ chinensis, 2 to 8 feet
„ insignis, 2 to 7 feet	Yew, common English, 3 to 8 feet
„ Menziesi, 3 to 7 feet	„ Irish, 4 to 10 feet
„ pinsapo, fine plants, 3 to 6 feet	„ gold-striped, 1½ to 3 feet
„ Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome	„ do., tall standards, 4 to 7 ft.
„ nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders	„ Dovaston, or Weeping, worked on tall straight stems
„ Montezumæ, 2 to 4 feet	Thuja aurea, the finest plants in the country
	Libocedrus chilensis, the finest plants in the country
	Large variegated Hollies
	„ Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.
All the plants here offered may be seen, growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.
The 2*d.* stamp will also include a descriptive Catalogue of their American Plants Roses, and Nursery Stock in general.

GLENNY'S SUPERB BALSAM SEED from the largest and most double Flowers in the world. Six classes, 37 stamps; 50 seeds mixed, 13 stamps—in sealed packets only—with Directions for Culture.—Letters to Mr. GLENNY, Horticultural Agent, Auctioneer, and Valuer, Dungannon House, Fulham.

WILLIAM BARRATT, LANDSCAPE GARDENER
Wakefield.
*** Plans and Estimates furnished.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the CRYSTAL PALACE, SYDENHAM, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. CONSERVATORIES AND AVIARIES fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. WINDOW BLINDS of every possible description, of the very best materials and workmanship.
N.B. An allowance to nurserymen and the trade.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON AND BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.
Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.
N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for GERANIUMS (show and fancy), FRENCH GERANIUMS, FUCHSIAS, VERBENAS, FAIRY ROSES, CHRYSANTHEMUMS, HELIOTROPES, CINERARIAS, CALCEOLARIAS, PRIMULAS, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

For further particulars, see Advertisement in last week's *Chronicle*. Catalogues forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, PROPRIETOR.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

GEORGE JACKMAN begs to announce that he has just published a new and complete CATALOGUE of his Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.

Woking Nursery, 1½ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—December 9.

NURSERY AND SEED ESTABLISHMENT.

LEXDEN ROAD, COLCHESTER.

(ESTABLISHED UPWARDS OF THIRTY-FIVE YEARS).

HORATIO BUNTING begs to announce that his extensive CATALOGUE of FLOWER and VEGETABLE SEEDS is now ready, and may be had on application, by inclosing two postage stamps. He can confidently recommend the articles therein enumerated, as nearly every article is his own growth, true to name, and of first-rate quality. Early orders will oblige, as the quantities of Lettuce and several other things are limited.

N.B. Please to observe the Address.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4*s*. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s*. per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s*. per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to announce that they are now sending out the following new Plants:

HELIOTROPIUM, BEAUTY OF THE BOUDOIR; the best for Garden and Pot Culture.

CHRYSANTHEMUM, ANNIE HENDERSON; the summer flowering variety; colour yellow, and form of Annie Salter; very dwarf.

GERANIUM, PRETTY POLLY; the loveliest hybrid bedding Geranium; colour, orange salmon.

ACHIMENES HENDERSONI; the newest and prettiest hybrid variety out.

FANCY GERANIUMS: CLOTH OF SILVER, EVENING STAR, and CRYSTAL BEAUTY; for form, colours, and general good qualities unequalled.

CINERARIAS: MRS. ROGERS, MRS. GERARD LEIGH, FASCINATION, and PRINCE OF PRUSSIA. (No further orders can be executed for Mrs. Rogers and Mrs. Gerard Leigh until next spring.)

See Autumn Catalogue for full descriptions, price, &c. &c.

The NEW RHODODENDRONS discovered on the Bhootan Alps, by THOMAS J. BOOTH, Esq., surpassing in magnificence of flower the Sikkim species. Full particulars of them will be seen on reference to their Spring Catalogue.

TO THE AGRICULTURISTS OF ENGLAND.

HARRADINE'S "NE PLUS ULTRA" WHEAT.—A single ear of this wonderful Wheat, which was purchased five years ago of a soldier on tramp, who brought it from some distant country, was sown in 1849; the produce of this was again sown in 1850, and also in 1851, when it yielded at the rate of 19 coombs, 1 bushel, and 1 peck per acre. This induced me to continue its cultivation. A sheaf and a quantity of corn will be shown on Messrs. Garratts' Stand in the Agricultural Department of the Crystal Palace, by which its quality and general character may be seen.

The following Gentlemen kindly lent me portions of their land last season, to test the producing quality of the Wheat, and up to this year not one kernel has been sold for seed. The quantity sown on all the varieties of soil has in no instance exceeded 4 pecks per acre. On land of Mr. Wasdale, in the parish of Woodhurst, this Wheat was sown after Tartarian Oats, Clover, Seeds, Peas, and Tares (some being sown in February, and equally productive). On land in the occupation of Mr. Gadsby, in the parish of Godmanchester, 1 acre, the yield of which has been 30 per cent. over his own Wheat, grown in the same field, and has been tested by several Agriculturists in the neighbourhood. On land in my own possession, in Needingworth and other places (both Fen and Highland), it has been sown after Wheat, Clover, Barley, Beans, Oats, and Fallow, and in every instance has been most productive.

I am prepared to part with a limited quantity, which can be had on application to me, at 25*s*. a bushel. All orders to be accompanied by a remittance.

JOHN THANG HARRADINE, Needingworth, St. Ives, Huntingdonshire.

TO THE SEED TRADE.

MESSRS. ARTHUR HENDERSON AND CO. are now prepared to supply SEEDS of the following recent introductions.

N.B.—Mr. W. H. DUNNETT (the raiser), Seed Grower, Dedham, Essex, will also execute all orders intrusted to him with the greatest care and attention.

WHITE TOPPED CLARY, a fine showy hardy annual, remaining a long time in flower—

1 oz. .. 5*s*. | 4 oz. ... 15*s*. | 8 oz. ... 25*s*. | 16 oz. ... 40*s*.

LIMNANTHUS SULPHUREA ODORATA; yellow ground, edged with white and rose-coloured stamens; a beautiful trailing hardy annual, very sweet scented, and throwing off its fragrance like the Mignonette, and continuing in flower for a considerable period:

1 oz., 10*s*. 0*d*. | 4 do., 35*s*. | 8 do., 60*s*. | 16 do., 100*s*.

DIANTHUS DUNNETTII SUPERBUS; very dwarf, fine dark Sweet William—

1 oz., 20*s*. | 2 oz., 35*s*. | 4 oz., 63*s*. | 8 oz., 105*s*. | 16 oz., 163*s*.

Pine Apple Place, Edgeware Road, London.

SEED WHEAT.—Samples and Prices of RED HYBRID, NURSERY, and other kinds of Wheat from the CHALK, sent on application to Mr. H. RAYNBIRD, Basingstoke.

The Red Hybrid and Nursery are well suited for late sowing after Turnips.

PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

J. AND J. FRASER have to offer a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application.

In offering these Pears, grafted on the Quince stock, we would wish particularly to call attention to their many excellent qualities. They are very compact in growth, and most prolific in bearing, fruiting profusely while the trees are small; thus forming a great acquisition for a small garden. Planted by the side of walks, in addition to their utility, they add much to the neatness and beauty of a kitchen garden. Indeed too much can scarcely be said in favour of these miniature Pear trees; as a proof of their merit the demand for them is yearly increasing.

Strong Trees, showing Fruit Buds, 2*s*. 6*d*. to 3*s*. 6*d*. each.

Lea Bridge Road, Essex, December 9.

J. AND J. FRASER beg to offer strong Standards of the following new ROSES, viz.:—

HYBRID PERPETUALS.

Alexandrine Bachmeteff, 3*s*. 6*d*.	Mrs. Rivers, 2*s*. 6*d*.
Baron Heeckeren, 3*s*. 6*d*.	Prince Leon, 5*s*.
Comte de Nanteuil, 3*s*.	Souvenir de Leveson Gower, 5*s*.
Docteur Juillard, 3*s*.	Triomphe de Paris, 5*s*.
General Castellane, 5*s*.	Bourbon, Paxton, 2*s*. 6*d*.
Gloire de France, 5*s*.	Reveil, 3*s*. 6*d*.
Jules Margottin, 5*s*.	Scipion Cochet, 2*s*.
L'Eufant du Mont Carmel, 3*s*.	Perpetual Moss Andre Thouin, 5*s*.
Le Leon des Combats, 2*s*.	Tea scented Melaine Willermorz, 3*s*. 9*d*.
Madame Domage, 5*s*.	Vicomtesse de Cazes, 3*s*.
Madame Fremion, 2*s*.	China, 2*s*.
Mère de St. Louis, 2*s*. 6*d*.	Citoyen des deux Mondes, 2*s*.

If one dozen are ordered the purchaser may select one in addition as a compensation for carriage. For a description of these new Roses, see Rose Catalogue, which may be had on application.—Lea Bridge Road, Essex, Dec. 9.

SPECIMEN IRISH YEWS.

THOMAS JACKSON AND SON, having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

8 to 9 feet high, and 8 feet in circumference...			63*s*. 0*d*.	each.
8	„	and 4 to 5 feet	„ ... 21 0	„
7 to 8	„	and 4 feet	„ ... 15 0	„
6 to 7	„	and 3 to 4 feet	„ ... 10 6	„
6	„	and 3 feet	„ ... 7 6	„

Handsome smaller specimens at proportionately lower prices.

Kingston, Surrey.

GRAPE VINES FROM EYES.

R. GLENDINNING has a large Stock of the undermentioned Vines, extra strong in pots, with well ripened wood, 5 ft. and upwards in the canes. Some of the kinds are new, and which have been proved and found of first-rate quality:

Black Hamburgh	Black Frontignan
The Pope's Hamburgh	Cabul
Wilmot's Hamburgh	Gronnir du Cantal
Mill Hill Hamburgh	Welbeck Tripoli
Victoria Hamburgh	Grove End Sweet Water
Muscat of Alexandria	Pitmaston White Cluster
Barnes's Muscat	Chasselas Musque
Reeves's Muscadine	Black Barbarossa
Raisin de Calabre	Muscat non de jura
White Frontignan	Chasselas de Fontainbleau
Grizzly Frontignan	Royal Muscadine
	Large White Sweet Water

Chiswick Nursery, London.

BASS AND BROWN'S NEW AUTUMN CATALOGUE, supplied free for three Penny Stamps. They have this season a very fine and vigorous stock of the finest Roses, among which are a number of very superb new Continental varieties, consisting chiefly of the perpetual class. The following selections will be highly approved,

ROSES.

100 Standards in 100 very superior varieties	...	...	£7	10 0
100 „ 50 „ „	...	...	6	10 0
50 „ 50 varieties ditto, all selected from perpetuals	...	...	4	0 0
100 dwarfs and half standards, or all dwarfs, in 100 very superior varieties	...	...	4	0 0
100 ditto in 50 varieties, ditto	...	...	3	0 0
50 ditto in 50 varieties, ditto, all from perpetuals	...	...	2	10 0
Fine mixed dwarfs, per 100...	...	...	1	10 0

Hardy Herbaceous Plants, Hollyhocks, prize-named Gooseberries, Strawberries, Standard Dwarf and Trained Fruit Trees, Flower Roots, and a variety of desirable articles offered in selection for present planting, for which see *Gardeners' Chronicle*, Oct. 14, page 659, and Oct. 28th, page 690.—Goods, carriage free (not under 20*s*.), to all the London termini, and all Stations on the London and Norwich Colchester Line. Plants added gratis with orders of 40*s*. and upwards.

Seed and Horticultural Establishment, Sudbury, Suffolk.

SPLENDID NEW RHUBARB.

SALT'S CRIMSON PERFECTION.

ROBERT SALT begs leave to inform the Gentry, Nurserymen, Gardeners, &c., that this splendid variety of Rhubarb is now ready for distribution. It is universally allowed to be the most early, prolific and delicious variety ever offered to the Public.

See *Gardeners' Chronicle* June 11, 1853: "Very good, and of a most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."—ED.

Certificates of Merit were awarded for specimens exhibited at the Meeting of the Horticultural Society, Regent Street, London, June 28th, 1853—at Nottingham, May 24th, 1854—at Derby Midland, May 25th, 1854—at Ormskirk, Lancashire, August 30th, 1854. Price 7*s*. 6*d*. per root, 3 for one guinea, and 6 for 2*l*.

Orders addressed to ROBERT SALT, Longton, Staffordshire; or the following agents, will have immediate attention: Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London; Messrs. BURGESS & KENT, Penkhull, Staffordshire; Mr. WOOD, Nurseryman, Coppice, near Nottingham; Messrs. FRANCIS & ARTHUR DICKSON, East-gate Street, Chester; Mr. SALISBURY, Melbourne, Derbyshire. A liberal discount allowed to the trade. A Post-office order from unknown correspondents.—Longton, Dec. 9.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. Packets of seed, consisting of 20 varieties, selected from the best show flowers, 5*s*.; 12 varieties, 2*s* 6*d*.; and from good double sorts, 1*s*.

Very superior Quilled German Asters, 12 distinct varieties, separate 2*s*., mixed 1*s*. per packet. Also Choice French Asters, 12 varieties, separate, 3*s*., mixed, 1*s*. 6*d*. Fine Quilled African Marigolds, lemon and orange, 6*d*. per packet.

New Double Crimson ROCKET, excellent bedding plant for spring flowering, 6*s*. per dozen, or 2*l*. per 100. Double French White, 4*s*. per dozen, or 30*s*. per 100.

Saffron Walden Nursery, Dec. 9.

THE PAMPAS GRASS, GYNERIUM ARGENTEUM.

LUCOMBE, PINCE, & CO. have a fine healthy stock of this highly ornamental plant, well established in pots, and fit to send out immediately.

Specimens of it are now and have long been flowering in their nursery, and it is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See woodcut and description of it in *Gardeners' Chronicle* of the 4th ult.

Sizes, prices, and all particulars may be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.

BEAUTIFUL NEW PLANT.

LUCOMBE, PINCE, AND Co., are now prepared to send out their beautiful New VERONICA KERMESINA, raised by that eminent Horticulturist, J. Luscombe, Esq., of Coombe Royal, who sent specimens to Dr. Lindley at the time of its first flowering, who thus pronounced his first opinion of it:—

"*The variety sent with this was charming; a decided rose colour having mingled with the violet.*"

See also notice of Dr. Lindley in the *Chronicle* for December 2d, 1854, as follows:—

"*L., P., and Co.: Your V. Kermesina is a handsome dark variety of V. Speciosa, its beautiful large spikes of deep purplish crimson blossoms cannot fail to make it a favourite.*"

Price 7*s*. 6*d*. each.—A few extra sized specimens may be had. The usual discount to the trade when three or more are taken.

Exeter Nursery, Exeter, Established 1720.

NOW READY.

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready, and should be ordered forthwith, by which a full supply of every kind of Vegetable Seed required during the whole year will be secured (including the best sorts yet introduced), and at a very small cost, viz.:—*

No. 1 Collection	... £3 0 0	No. 3 Collection	... £1 5 0
No. 2 do.	... 2 0 0	No. 4 do.	... 0 15 0

The quantities in each collection being apportioned to the size of the garden, INSTRUCTIONS ON CULTIVATION will be enclosed with Nos. 1, 2, and 3. To secure the best sorts, orders should be given immediately, addressed

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 9, 1854.

THE hope we lately expressed that some of the readers of our columns might be able to favour us with certain information respecting the place where the so-called Pampas Grass (*Gynerium argenteum*) grows wild, has already been kindly responded to by "H. K." at p. 741, and more recently by "a Devonian" at p. 774. To the information thus obligingly communicated we have now the pleasure to add the following important facts.

In the first place, Sir WILLIAM HOOKER has been good enough to examine his immense herbarium, in which he finds wild specimens from the following quarters, viz.:—Monte Video, Captain PHILLIP KING and SELLOW; Rio Grande do Sul, TWEEDIE; Buenos Ayres, TWEEDIE; Chiloe, Captain PHILLIP KING; and Chili, CUMING, No. 386.

"It would thus appear," observes Sir WILLIAM, "to extend across from the South Atlantic to the South Pacific (unless it be a kind of maritime Grass, which is very possible), in south latitude from about 30° to 42°. NEES, in Mart. Fl. Brasil. Gramineæ, gives St. Sebastian and province of St. Paulo, in about 24°S. Travellers, who know nothing of Grasses, probably mistake the Gynerium saccharoides for this. The panicle is very like in habit, but the foliage quite different—infinitely broader."

Our distinguished friend Mons. WEDDELL, the intrepid traveller in S. America, writes from Paris as follows:—

"Whilst examining, this morning, a parcel of Chilian plants, I fell in with a fine panicle of Gynerium argenteum, gathered by BERTERO from the table-lands of the province of Colchagua; and I had scarcely glimpsed at it when I remembered having myself picked in the Bolivian Andes, and classed under the name of G. speciosum, something very similar to it. Thinking the subject might interest you, I lost no time in comparing notes, and soon found my supposition confirmed. I am now, then, enabled to assert that one of the habitats of Gynerium argenteum, *alias* G. speciosum (NEES et MEYEN), is the Cordillera of the Andes, from 14,000 feet downwards. By MEYEN it was picked on the banks of the Rio Copiapo (North Chili), at about 50 miles from the coast; that is, a few miles only beyond the famous copper mines of San Francisco. PŒPPIG, again, met with it in the province of Concepcion (Centr. Chil.), on the steeps of the volcano of Antuco, situated, I believe, at about 100 miles from the sea. The precise locality from which BERTERO brought his specimens is Rancagua, a town situated on the 34° of south latitude. I myself picked the plant near La Paz, in the north of

Bolivia, at about 12,000 feet, but I remember well seeing it in several other spots round about the great lake of Titicaca, a thousand feet higher up. Near La Paz it may be said to grow profusely, hedging in, as it were, the sides of some rivulets used for irrigation or for working mills. My not being more struck with its beauty (for struck a little I was) may be accounted for by the fact that the stems do not, in those elevated regions, attain anything like the height they appear to have under a more genial sky, although the panicles themselves are a foot or a foot and a half long. Besides this, the tussocks have a very untidy appearance, arising from the persistency of the dead, brown, and wiry leaves. The mean temperature of the districts in which this Grass grows accounts very well for its hardiness in European gardens, and it appears very natural that its dominions should extend from Chili towards Monte Video, or Buenos Ayres, but I can hardly believe that it is to be found in the torrid regions of South America, as we are led to infer from the note inserted in your last week's columns by "a Devonian." Might not the panicle seen by your correspondent be that of Gynerium sagittale (G. saccharoides, Humbl. and Boupl.) and not that of G. argenteum. In appearance they are very much akin, but there are only two flowers in each spikelet of the former, whereas the latter has constantly a greater number (three to six). I can the better imagine this *quiproquo* to have taken place, having been myself to the very part of the Parana alluded to by your correspondent; I am therefore able to state that G. sagittale is very abundant there. Indeed the Indians of North Paraguay employ no other material for their long arrows than the remarkably straight woody peduncles of this magnificent plant, far more magnificent than any other Grass I know of. Let me add that in the course of my numerous visits to Mount Corcovado, during a three months' stay at Rio, I saw nothing that could be taken for a Gynerium, unless it were a Sugar Cane! A circumstance not to be lost sight of by those who may wish to import this beautiful Grass by cuttings is, that it, as well as all its congeners, have their male and female flowers borne by separate individuals, so that for there to be even a chance of the plant eventually propagating by seed in Europe, due attention ought to be paid to sexes."

It is perhaps not so generally known as it should be that we owe the possession of this magnificent exotic to the skill of David Moore, Esq., the indefatigable superintendent of the Botanic Garden at Glasnevin, near Dublin. He has favoured us with the following account of its introduction to Ireland. "I have to state that I received the seeds from which *two* plants were raised from my valued old friend, Mr. Tweedie, of Buenos Ayres, who collected it somewhere in South Brazil. I have just laid my hand on his letter which accompanied the seeds, where I find the following note:—

'I now send one specimen, Aira gigantea, which is the most showy plant of any class in this country. It has flower stems from 10 to 12 feet high, with large white spikes of flowers, 12 to 15 inches long; appearing, when in blossom, like white sheets hung on poles, and seen at a distance of many miles in our flat plains. It likes a cool clay soil.'

"There cannot be any male plants in the country, as all have been propagated from the two plants raised here, both of which were females."

It is to be hoped that these very satisfactory details will secure an abundant supply of seed, so that the most magnificent of Grasses may be made to decorate every cottage garden. We may add that the plant in the garden of the Horticultural Society has lost none of its beauty as yet (Dec. 6), but continues to rear its graceful plumes with all their original silvery brilliancy on the bank of evergreens where it is stationed.

Samples of Grapes from Sorrento, for which we are obliged to Mr. Taylor, have just reached us, showing the deplorable state to which the vintage is reduced so low down in Italy as the Bay of Naples. On a bunch now before us there are barely half a dozen tolerably sound Grapes, under the guise of diminutive and meagre raisins, while the remainder presents nothing save mere husks containing two or three seeds. As in other cases of mildewed Grapes these are perfect and abundant, notwithstanding the depraved condition of the pulp, on which it might be supposed that they would depend for nutriment. There is, however, reason to believe that they cannot be in precisely the same condition as those which ripen where the accompanying parts are healthy and fully developed, and since the most useful varieties of cultivated plants are raised from seed which has been less grossly nourished, or in which the accompanying tissues may not have reached their full development, it would be worth the trial whether something might not be elicited, with new and profitable qualities, from the seeds of diseased Grapes of superior kinds. Attempts are now in progress to improve the properties of American Vines, so as to make them more suitable to the climate of the more northern states and more calculated to produce wine of a first-rate class, and there is no reason why similar experiments should not be conducted on a much broader scale than heretofore in Europe, whether by crossing with the American varieties more extensively cultivated in Europe, such as the Isabella, which almost entirely resists the mildew, or by raising seedlings from native varieties. Count Odart's experiments, indeed, were not very encouraging, as they gave no result till after the lapse of 25 years, but M. Vibert has now succeeded in obtaining fruit from trained seedlings in five years, and he has not neglected the Isabella, though his experiments had no especial reference to the prevalent disease. In consequence of the dicœcious habits of the varieties of Vitis Labrusca, of which the Isabella is a seedling, they have a peculiar tendency to produce new forms under the influence of the pollen of neighbouring Vines, and accordingly the seedlings of the Isabella not only depart in some cases from the peculiar Raspberry flavour of the original, but present almost every conceivable difference in shape and colour.

As regards the diseased berries from Sorrento, most of them are covered with white or olivaceous mould. The former consists of more or less decomposed Oidium, and the latter of the common Cladosporium. Amongst the former we could find no trace of any secondary form of fruit. The latter has, in all probability, made its appearance during the course of transmission. Sulphur has been used on a large scale with great success during the present season in our Hop grounds, and unless the prejudices of the peasantry interfere, we feel sure that the results would be highly beneficial in the vineyards, where it could be applied with far less difficulty and at a less expense. It must, however, if employed at all, be used as soon as the evil makes its appearance, and a second or even a third application may be necessary, if not entirely conquered by the first or second. *M. J. B.*

Sir Joseph Paxton has now received, through the electors of Coventry, the highest honour which his countrymen have it in their power to bestow. And he has well deserved it. From a very humble station he has risen by a rare combination of industry, talent, enterprise and integrity, to the highly honourable post just conferred upon him. Long may he live to fill it with credit to himself and advantage to his country.

We are precluded by our compact with the public from engaging in party politics. Even in the absence of such a compact we should avoid them. We may, however, venture to say, what we know that the great middle class of English will heartily re-echo, that such men are much wanted in the House of Commons, independent, honest, fearless, not to be intimidated by mob violence, not to be deluded by sentimental folly, not to be cajoled by Treasury blandishment. What his politics may be is in our eyes immaterial; good men and true are to be found on every side in the House of Commons. But this we may say of Sir Joseph Paxton, whom we have known for many a long year, that he is a thoroughly upright as well as clever man, and of the true stuff of which recruits for Parliament should be made.

VEGETABLE PATHOLOGY.—No. XLIX.

219. *b. External or Accidental.*—It has been shown that even constitutional tendencies to disease are in the first instance induced by external causes, though capable afterwards of being handed down to remote posterity.* There are, however, many maladies which are derived at once from outward agents, the effect of which is immediately visible, and, in many cases, as speedily and certainly recognised. The perfect health, for instance, of every particular species depends upon a certain combination of temperature and moisture, the composition of the atmosphere, and of the nutriment imbibed, and a great part of the success of the cultivator depends upon a due appreciation of the requisite conditions, and an artificial compensation where they cannot be otherwise secured. The conditions are as variable almost as the plants themselves. Some require constant moisture, accompanied either by a dry or moist state of the atmosphere, others actual immersion in water; others, again, demand a winter, others a summer rest; others are impatient of any direct moisture, imbibing principally what is contained in the surrounding air; many will flourish only in the pure attenuated air of alpine regions, while others are as greedy of the heavy atmosphere of swamps, and all these with almost every possible variety of combination. If such conditions do not exist the vital action is impaired, and either a sickly growth is the consequence or absolute death. The influence of external atmospheric and climatic agency on the health of plants has already been considered, and need only be mentioned here as a simple indication of the causes from which disease arises. Details will hereafter be requisite in the consideration of particular diseases.

220. There are, however, other external causes which produce either disease or injury, which do not depend upon any mere atmospheric conditions affecting the chemical constitution and the attendant vital energies of plants, but upon specific circumstances, whether of rare or frequent occurrence. The violence of winds, the destructive force of lightning, an atmosphere depraved from manufactures of corrosive chemical matters, the impurity due to crowded population, accidental injury or injudicious pruning, excessive manuring or the presence of matters prejudicial to vegetable life, whether in greater or less quantities, are all in turn fruitful sources of disease. The consequent malady is not always speedy in its effects, but destruction is not less sure on that account.

221. In order to the maintenance of a due balance between the several parts of creation, Providence has provided not only that one order should live at the expense of the other, as is the case virtually with the animal and vegetable kingdoms, for even carnivorous animals are themselves, in the end, "served by the field," but that one portion of the vegetable world, and that to no insignificant degree, should maintain its existence from the other. Nay, even the vegetable world in turn preys on animal life, and perhaps to a far greater extent than is at present recognised. Thus it is that a mutual interchange of destruction is constantly at work. It is not however in general the larger animals, which are less numerous, that cause extensive injury, but rather the almost infinite myriads of insect plagues, abundant both in numbers of individuals and species, that cause real injury to plants, almost every species, or at least natural group, having one or more enemies, and sometimes a considerable number, destined to live at its expense, either impairing luxuriance by the destruction of its roots or foliage, or destroying fertility by injuries to the fructifying organs, which are frequently the parts most especially subject to injury. The ravages of caterpillars and locusts are too notorious to require particular notice, fatal in the case of plants of annual growth, and frequently prejudicial to health to those of a more enduring nature, in consequence of the destruction of the organs more especially necessary for the accomplishment of the purposes of due elaboration, and the preternatural efforts at development to replace the loss which can only be made at the expense of the stores already deposited in the tissues, and intended for use at some more distant period. The attacks of different species of aphis though more insidious are not less certainly destructive, as they live at the expense of the nutritive matter already in greater or less measure prepared in the cellular tissue, and directed from its proper office of maintenance and increase of the several organs of the plant. The Wheat midge affords an excellent example of sterility consequent on the ravages of minute insects, both on account of the apparent insignificance of the object, and the extent of evil to which it gives rise. It is but seldom that any direct remedy can be employed against these inflictions. But happily, either from the peculiar habits of the species, or from countervailing enemies in other members of the animal world, their visits are few and far between, or their multitudes disappear without leaving behind a proportionate progeny. *M. J. B.*

* Other instances of disease arising from internal causes might have been mentioned, as the formation of besom-like fascicles in the Birch, the knots in the bark of Beech, or the tufts of branches in the Fir, which have given rise to what is called Pinus Clanbrasiliana. These, however, and other like matters, will find their place under a different head.

ANGELONIA GRANDIFLORA.

This is a really useful plant for summer decoration, producing spikes of Pine-apple scented flowers very freely, and remaining in beauty for months; being also of quick growth and easy culture, useful sized specimens of it may soon be obtained. Cuttings selected of short-jointed rather firm bits of the young shoots should be put in early in summer, placing them in a moderate bottom-heat, where with proper care in watering and shading, &c., they will emit roots in a few weeks, and may then be potted singly in small pots. Replace them in a warm moist situation after potting, and guard them from the direct rays of the sun until they become established in their pots, when they should be gradually inured to a free circulation of air, and placed near the glass. Let the young plants be stopped as frequently as may be necessary to secure a bushy habit of growth, and attend to shifting when they require more pot room.

With ordinary management strong bushy plants in 7-inch pots may easily be obtained by autumn from cuttings rooted in spring, and these with common care will form specimens of almost any desired size the following season. The plants are somewhat liable to damp off in winter unless properly treated, therefore place them near the glass in a light airy part of a house where the temperature is kept at about 50° by fire-heat, and give water sparingly while the plants are in a dormant state. Early in February cut back and tie-out the principal shoots sufficiently to secure a thick bushy habit of growth, and place the plants near the glass in a warm house, and thoroughly moisten the balls in order to induce active growth. Also see to the state of the roots shortly after placing the plants in heat, and give a liberal shift to such as are found to require more pot room, and water carefully until the plants get into free growth, but moisten

them overhead with the syringe on the afternoons of fine days, and maintain a moist atmosphere. As the season advances, give air freely on fine days, and attend to stopping any shoots that may incline to outgrow the others, and keep them nicely tied out, so as to promote a bushy habit of growth.

When good sized bushes are obtained, which, with good management, will be the case by May, discontinue stopping, and in order that the flowering shoots may be as dwarf as they can be obtained, keep the specimens near the glass, and admit air rather freely on fine days, keeping the shoots thin by staking. If the specimens appear to want more pot room, this should be seen to as soon as they start into growth after the final stopping, and if they are expected to continue growing and flowering the greater part of the summer and autumn, they must be afforded sufficient space for their roots. When they are fairly in bloom they may be removed to a warm corner in the conservatory or show-house; an occasional watering with weak clear manure water will be of great service in maintaining them in a vigorous healthy state, and securing a succession of flower; and, if necessary, they may be cut over, and removed to a warm situation, where they will soon throw up an abundance of young wood, and flower profusely a second time. When the specimens become useless for decorative purposes in autumn they may be thrown away at once, as young plants grow so rapidly that it is useless wintering large bulky old specimens—but be provided with young plants before throwing away the old ones. Any light rich fibry soil, such as equal parts of loam, leaf soil and peat, with a proper admixture of sand, will answer perfectly for the growth of this plant; but a small proportion of well decayed manure may be added with advantage at the last shift, and good drainage should be secured. *Alpha.*

ORIGIN OF THE PEAR TREE, ITS PROGRESS, AND SUCCESS.

(*Continued from p.* 773.)

TWENTY-FIVE years ago, I commenced the formation of my present collection of fruit trees; and I have successively added to it all the best varieties in the trade, and also such as I could discover in the collections of the most intelligent amateurs. These varieties, which are all grown on the Pear stock, have been carefully studied in my nursery, and in the gardens of my friends, under different circumstances of soil and aspect. Their examination is, however, far from being complete as regards the latest novelties; for, in order to be sure of them, they must be seen during several periods of growth and production. Indeed, it is not sufficient to remark the vigour of a variety of the Pear tree; it is also necessary to ascertain its hardiness after it has been for some time in full bearing, this being the principal test of its merit. The last three seasons have been very favourable for ascertaining this property of hardiness, on account of the extreme variations of the weather during the winter and spring.

My nursery of fruit trees is established in a situation exposed to every wind, and all severities of the climate throughout the year. The ground is slightly inclined to the west; the surface soil is light; the subsoil in certain parts a layer of siliceous marl, or marly clay. The subsoil of the lower portion is alluvial. The land, in short, possesses all the conditions desirable for the growth of the Pear tree, both on the Pear stock and on the Quince. In this nursery, about a hectare [nearly 2½ acres] is planted for examination and comparison:—

1st. 450 varieties of Pear trees of English, French, American, German, and more especially of Belgian origin.
2d. 150 varieties of Apple trees which have originated in the same countries.
3d. 150 varieties of Plum trees.
4th. 50 „ of Cherry trees.
5th. 20 „ of Peach and Nectarine trees.
6th. 10 „ of Apricot trees.

Whilst visiting, from time to time, the gardens of amateurs, I have been fortunate enough to find some of the varieties mentioned in Van Mons' Catalogue of 1823, and with which the numbers had been given with the bud or graft. After having ascertained their identity, I had them propagated. Perhaps the Americans and Germans will send back to us some of these varieties with new names, as has already been the case. It is also likely that some of the varieties mentioned with names, but without numbers in the catalogue above referred to, have been named afresh by the successor of the late Van Mons. By adding his own name to the names of varieties raised by Van Mons he has exceeded his limits, by passing for the raiser, whilst he was only the owner of an object produced by another. The successor of the late Esperen has taken the same liberty with the seedlings left by the latter. I confine myself to the statement of these facts for the interest of that part of fruit-tree culture which will indisputably continue to be the most interesting in the annals of this division of the horticulture of the 19th century.

Having briefly explained the history and progress of the Pear-tree, we come now to the success obtained in its cultivation, which is the principal object of the present communication. Before proceeding further, it will, however, be necessary to make some general observations.

In the denominations of new varieties, three of the raisers have applied to their seedlings that by which the generic name is known, according to their form and flavour, and as understood by pomologists in arranging them under the forms of *Beurré*, *Bergamotte*, *Bezi*, *Bon Chrétien*, *Calebasse*, *Colmar*, *Rousselet*, and *St. Germain*. The terms of Belle, Beurré, Fondante, and Délices do not apply to form, but to qualities which are found in the seven distinct forms, and might, without inconvenience, be left out for the future.

By adding to the generic name [Beurré, Bergamotte, &c.], either that of the raiser of the variety, or that of a friend, the name of the place of its origin, or whatever may be thought desirable, the variety is then definitely named. After having borne fruit two or three times, if the form was not fixed, the prefix of *Poire* only was employed, as we see in the case of the Poire des deux Sœurs, Poire Prévost, the forms of which belong to none of the seven denominations generally known.

Varieties of Pears in every respect worthy of recommendation, raised from seed since the commencement of the present century and till recently, by the late Van Mons, Major Esperen, Bouvier, and others.—In the climate of Belgium, and in those similar, these varieties, with scarcely any exceptions, are suited for pyramids and standards, and do not absolutely require the protection of a wall for the production of good fruit. Cultivated on the Pear stock, the treesin general grow vigorously in a light deep alluvial soil, and better still in one rich in humus, provided always that the subsoil is free from stagnant water during winter. The form and quality of the fruits depend, in a great measure, on the conditions of the soil and subsoil, careful cultivation, the proper management of the trees, and the vigour of the stocks. The mean period of the maturity of the fruits is subject to the influence of the same causes. The temperature of the season, the period of gathering the fruit, and their preservation in the fruit room exercise likewise a certain effect on the quality of the fruit.

It is certain, that if the varieties obtained from seed, indicated in the following list, were deducted from the number of those cultivated in our climate in the open ground, the varieties of good late table Pears would be very limited.

ABBREVIATIONS.

(B) placed within parenthesis, after the name of the fruit, signifies that the variety has been raised from seed by the late Bouvier, of Jodoigne.
(Esp.) signifies by Esperen, of Mechlin.
(Grég.) „ by Grégoire, of Jodoigne.
(V. M.) „ by Van Mons, of Brussels.
The names of other raisers are given at full length.
Med. signifies medium size.
Vig. „ vigorous.

I have not included in the preceding lists old varieties already well known; I have also omitted many others, from not being quite sure of their merits. The varieties mentioned as being not vigorous are, notwithstanding, sufficiently hardy to produc fruit in our climate as standards. Although some sorts worked on the Pear stock will scarcely form a good pyramid, yet when they are budded standard high they become very fruitful. We may instance the Beurré Bennert, Bergamotte Dussart, Beurré Delfosse, Dumont-Dumortier, Colmar Nelis, Fortunée de Reumes, Fondante de Charneuse, Beurré Six, Poire de Tongres, and others of somewhat weakly growth.

In general, all the less vigorous sorts, when grown on a wall, produce fruits of larger size than when grown as standards. We have seen the following succeed perfectly well upon a wall. The Chaumontel, Beurré d'Hardenpont, on an east or west aspect; La Fortunée on a south-east; the Josephine de Malines on south-east and south-west; and the Virgouleuse, which we consider the best of those we have received from France, on account of the delicacy and beauty of its fruit, when the tree is grown on its own stock, and against a wall with a south-east, south, or south-west aspect.

We invite amateurs desirous of ascertaining the vigour and hardiness of the new varieties of Pear trees to visit our collection of fruit trees, in the months of July, August, and September. They may then satisfy themselves of the real merits of a variety, by examining well-managed pyramids from 10 to 25 years old, grown on the Pear stock, and bearing fruit in abundance in a situation exposed to the winds, and to all the severities of the seasons.—J. DE JONGHE, 20, *Rue des Visitandines, Brussels, Nov.* 11, 1854.

* We retain the primitive name given to this variety. The name of Duc de Brabant, subsequently given to it by M. Bouvier, ought to be reserved for a longer keeping and superior variety.

Home Correspondence.

Cupressus Lamberti, or macrocarpa.—Surely there must be some mistake about the plants to which the preceding names are applied being identical; at least, all the plants which I have seen at Singleton, Tirydale, and other places in South Wales, are so different in character from the original C. Lamberti as seen growing in the gardens of the Horticultural Society and other places near London, that if they are not specifically different they must be very distinct varieties. In this country, and I speak of plants sent direct from Chiswick, C. macrocarpa grows as upright and compact as C. Goveniana, attaining the height of from 8 to 10 or 12 feet in a very short time; and the largest of the plants not being more than from 2 to 3 feet in diameter, and nearly the same thickness from the base to the apex, the branches all growing vertically and not even the small branchlets are seen to assume an horizontal position; on the contrary, the C. macrocarpa (I speak of the plant, for example, growing on the south side of the large conservatory in the garden at Chiswick) scarcely assumes a vertical position at all; even the leader seems loath to take the lead, while the whole of the branches are, more or less, horizontal, and the diameter of the plant is, at the least, two-thirds as much as its vertical height. At Brooklands and Kimuel, near Chislehurst, and also in Messrs. Waterer and Godfrey's specimen plants, at Knap Hill, the horizontal prevails over the upright habit, and this not only among specimens of full development, but also in young plants of not more than 2 or 3 feet in height. Of botanical distinctions I say nothing, I merely speak of appearances patent to every one; and if these appearances are not sufficient for specific characters they are at any rate marks strong enough to entitle either one to be called the "upright," or the other the "horizontal" variety of C. macrocarpa. Apart, however, from the name, this is a plant which cannot be too strongly recommended, for it grows splendidly, whether sheltered or exposed, and is at all times rich in colour, and strong and robust in habit. Some of the plants at Singleton have grown as rapidly as Willows, and I think I may say that they have made as much as 3 feet of wood in one season. Conifers generally do not do well in this locality (Swansea); the Larch and Scotch Fir do not refuse to grow, but the smoke from the copper works almost every season plays sad havoc with the young growth, and in time totally destroys strong established plants. This Cypress seems not to suffer, and even last winter, which was more severe than the winters generally are in South Wales, it escaped quite unscathed. *W. P. Ayres, Nov.* 14.

The Beurré Superfin Pear.—In common with other members of the council of the Pomological Society, I am much obliged to M. de Jonghe for his description of the Cumberland Pear; he has once or twice written to me on the subject, and as this Pear has not yet borne fruit with me, I was quite inclined to think that the Cumberland was the original name of the Beurré Superfin. His description, however, of the former Pear has put all to rights, for I think I can now say with confidence, that M. de Jonghe has been victimised by having the Cumberland Pear sent to him under the name of the Beurré Superfin. I need not quote here M. de Jonghe's description of the Cumberland Pear given in p. 774, as it is so easily referred to, but I will describe faithfully the characters of the Beurré Superfin grown here, a fruit of which, sent by M. Langelier, was tasted by the

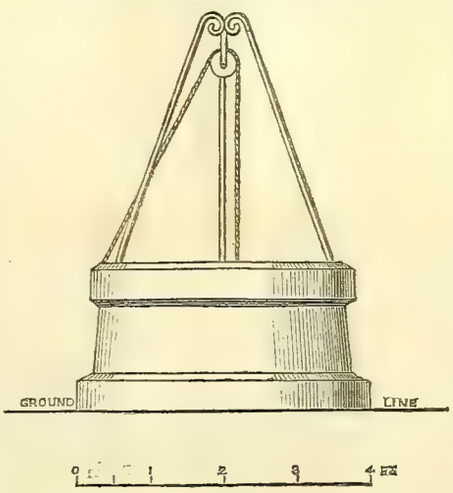
council of the society on the 6th of November. Shoots moderately vigorous, pale, yellowish-brown, spotted with grey, much inclined to horizontal growth; when young very thorny, so much so that when I first received the sort from Angers and observed the young grafted trees, I thought I had been cheated, and that a wild Pear had been sent to me with a superfine name; buds acutely pointed, so as to prick the finger if pressed forcibly; fruit constantly covered with a light brown russet, scarcely even a spot of green to be seen through it; in form much like a large winter Nelis; calyx small. In 1851, 1852, and 1853, it ripened here from the middle to the end of September; its flesh melting, vinous, very slightly perfumed, but full of juice and exceedingly agreeable. I was surprised to see a specimen sound and good so late as the first week in November as I have never before observed its keeping so long. The tree is remarkable for its hardiness, for although coming from the beautiful climate of Angers it does not know how to canker, and has a robust habit similar to some of the Pears raised by Mr. Knight, such as the Eyewood, March Bergamot, and others. M. de Jonghe having mentioned the necessity of making the name Beurré Superfin a synonym reminds me forcibly of the great inconvenience occasioned by making synonyms with the facility they do on the continent; it is a great evil, and ought to be avoided as much as possible. I have received the Beurré Rance from Belgium under six or more different names; among them I remember the following:—Banneaux (Van Mons), Beurré d'Hiver (Van Mons), Beurré Beymont (Bouvier), Délices de Charles (Bouvier), and Present Van Mons (Van Mons). Now, if I had followed the custom of the continental pomologists, I should have made all these names synonyms of the Beurré Rance; but, as I detest them, I merely considered that I had been deceived, and there the matter rested and does rest. I have what the French call a "school" of Pear trees (*i. e.* specimen trees, one of a sort) of 1000 or more varieties; the history, description, and, above all, the synonyms of these Pears would fill a volume I fear not very readable. The very few (I mean few as compared with the large number of names) good sorts I find among them I propagate; the mediocre and inferior varieties I forget, and forgive those who sent them to me. Permit me in conclusion to observe that we owe you thanks for allowing these amicable discussions in your columns; they serve to bring out little matters of fact which would otherwise be forgotten in the hurry of our busy English life. *Thomas Rivers.*

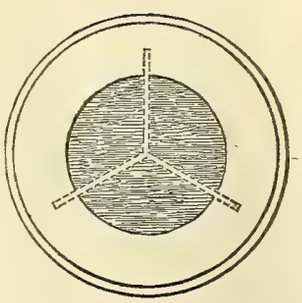
The Weather.—I see by your paper of Saturday last that the minimum temperature at Chiswick on the night of 26th November was 28°. Should this not be an error for 18°; it affords a curious instance of partial distribution of frost. Here on the morning of the 27th my thermometer at 8 o'clock stood at 20°; and I heard from good authority that in a low situation three miles from this place it was observed as low as 11°. I have carefully perused the Chiswick observations, and have found the night minimum considerably below that of this place with few exceptions. *C. B. N. P., Stevenage, Herts, December* 4. [The minimum temperature at Chiswick on the night of the 26th was 28°, according to two registering thermometers.]

Pear-growing.—The observations made by my friend, Mr. Rivers, in the *Gardeners' Chronicle*, p. 741, cannot be taken in earnest. He supposes that I am enthusiastic; he imagines that I am very happy in combating with nature, bidding defiance to frosts, and the inclemencies of northern climates. There is nothing in any of my previous communications which authorises him to make these gratuitous suppositions, the responsibility of which I therefore leave to himself. In pointing out the places near London where the Pear trees appear to be in every respect defective, I undoubtedly did not wish to judge of those which I had neither seen nor examined. In criticising, I have said in what way the Pear trees should have been reared, in order to yield fruit regularly. It was upon this ground that I had hoped my friend, Mr. Rivers, would have stood, for the interest of pomology, and of the numerous amateurs who would have benefited by his so doing. I repeat that it is far from my wish to include in my strictures that which I have not seen and verified. It is very possible that in ordinary seasons Pear trees badly reared, badly planted, and allowed to grow without any systematic pruning may occasionally bear abundantly; but these unusual crops are exceptions to the general rule. They may be looked for once in ten years. Would it not be deplorable to depend on chance for plenty, when this could be obtained with certainty by the judicious application of the precepts of science? What does science say? Whether a dwarf or tall pyramid be reared, it must have a straight and upright stem furnished with branches at regular distances, in order that there may exist between them a certain harmony, or proportion, which is pleasing to the eye and favourable to the regular and yearly production of fruit. These notions are indeed entertained by the pruners of forest trees, but simple as they are, we have not seen them applied at any of the places which we have pointed out. In Belgium, as in England, wherever we have seen the Pear tree abandoned to itself, we have rarely seen fruit; or, if there is, it is generally defective and bad. I beg my amiable opponent to persuade himself of this, which partakes neither of enthusiasm nor of poetry. The Pear tree, as regards the varieties which modern science has produced, is a civilised tree, which likes to grow near habitations, in the gardens of towns where it can breathe freely, and in those of the country. It requires the constant attention of an intelligent man to yield to him with interest, by its delicious products, the just recompense of his pains. It must, at least, be planted in a proper soil and situation; it must receive the nourishment necessary for its growth and support of its fruits; if it is thirsty, its thirst must be allayed. The insects which attack it must be removed, and the diseases from which it suffers, and which hasten its decay, must be cured. The sap should rise by the vertical stem, and circulate equally through all the branches, in order that the organs of fructification may be formed, and arrive at perfect maturity. The shoots which originate in places where they can never be wanted must be at once removed, in order to save the tree from wounds difficult to heal over. It is absolutely necessary that the air should circulate, and that the rays of light should penetrate among the branches, to produce their beneficial effects on the organs of fructification. When a Pear tree, sufficiently vigorous and hardy for our climate, is managed according to these instructions, which are, in fact, a recapitulation of those contained in my previous communications, I think that we need not dread the frosts of our rigorous winter, nor the variable weather of our springs; for the tree thus treated will better resist these at the time of setting its fruit, than one will do that is abandoned to chance cultivation. Have we not had in Belgium, situated in the same latitude, and subject to the same winds, the same variations of climate in the month of April as in England? Very well, then, all the amateurs who were careful in the management of their trees had a crop, whilst the negligent had none. In conclusion, I am aware that it is difficult to persuade and convince by reasoning, supported by facts, a person who, from motives of whatever kind, will not be convinced (*qu'il est difficile de persuader et de convaincre par le raisonnement appuyé de faits une personne qui ne veut point l'être pour des motifs quelconques*), but I hope that amateurs will profit by instructions, which are the result of long experience, of which we can exhibit numerous proofs in our gardens. *J. De Jonghe, Brussels, Nov.* 20.

Railway Wells in France.—I send you plans and drawings of two wells on the railways near Paris, one on the Chalons, the other on the Dieppe side of Paris.

Railway Well.





Plan of Well.

Somerset, Winscombe Hill, near Axbridge. [The annexed woodcut represents one of the wells in question. The other is so like it as to render a second illustration unnecessary. It answers the inquiry made lately by a correspondent desirous to construct such wells.]

Late Strawberries.—In making the following remarks on the capabilities of the Strawberry plant to blossom and fruit twice a year (without forcing), I must first observe that I have not the least wish to disparage or in any way lessen the merits of the new French Strawberry Délices d'Automne, though it was the reading its characteristics in an article in your Paper of the 18th ult. which has called forth my observations on the subject. My new seedling Sir Harry (a specimen of which I send for your inspection), which did not cease its first bearing till the beginning of August, was again in blossom and fruit in October and November in the open beds. Now, although this fecundity tends to show the strong disposition of the seedling to fruit, its value, in my estimation, is not thereby increased, for Strawberries ripened in the open beds at a late season of the year must always want that rich full flavour which the summer's sun alone can give them; not only have the parent plants borne a second crop, but their autumnal runners have both blossomed and fruited. By forcing the best fruiting sorts you may always obtain two well flavoured crops; for by trimming and nourishing the plants with liquid manure, and plunging the pots after spring bearing in the ground, they will blossom and fruit again in the autumn, when the pots must be moved once more into artificial heat to colour and flavour the fruit. There are many of the nobility who expect to see a plate of Strawberries on the breakfast table all the year round, therefore, under such circumstances, the Délices d'Automne and Sir Harry, as Perpetuals, will be found desirable acquisitions. *Richard Underhill, Sir Harry's Road, Edgbaston, Birmingham, Nov. 30th.*—Since writing the above I have been to my beds, and find that the severe frost of last Saturday night and Sunday has destroyed the fruit and blossoms. *R. U.*

Societies.

Horticultural, *December* 5.—Mr. Glendining in the chair. A. W. Mactier and C. W. Waterlow, Esqs., were elected Fellows. The more important features of this meeting were the different exhibitions of fruit, particularly of Pears, of which there was a great number of very fine specimens. Of this kind of fruit Mr. Ingram, of the Royal Gardens, Frogmore, sent a collection at once perfect, both as to colour, ripeness, and growth. The sorts were Easter Beurré, Beurré Diel, Passe Colmar, Chaumontel, Vicar of Winkfield, Glou Morceau, and Winter Nelis. These received, as they well deserved, a Silver Knightian Medal. Collections of equal merit, but both inferior to that from Frogmore, were furnished by Mr. Snow, gr. to Earl de Grey, Wrest Park, Beds, and Mr. Tillyard, gr. to the Right Hon. the Speaker at Heckfield, Hants. From Wrest Park came Beurré Diel, beautifully coloured; Easter Beurré, small, and not ripe; Chaumontel; Winter Nelis, very good, and ready for table; small fruit of Napoleon; Vicar of Winkfield; very good examples of Passe Colmar; Old Crassane in good condition; Glou Morceau, well coloured; Susette de Bavay; and fine specimens of Uvedale's St. Germain. Mr. Tillyard had Winter Nelis, Passe Colmar, Glou Morceau, Beurré Rance, Easter Beurré, large, but not ripe; Susette de Bavay, three nice fruits of the true Knight's Monarch, large specimens of Ne Plus Meuris, Forelle or Trout Pear, Beurré Diel, large and finely coloured, and Grosse Calebasse. A Banksian medal was awarded to each of these collections. J. Abell, Esq., of Limerick, sent a collection of Pears, which served to show with what success this kind of fruit can be grown in that part of Ireland. They were mostly from trees worked on Quince stocks, and were not very large, but in general finely coloured. The sorts consisted of Beurré Rance, both from Pear and Quince stocks, those from the former not larger than from the latter, but the crop on the trees on the Pear stock was stated to be the heaviest; Easter Beurré, large and fine from a south-east wall; Spring Beurré, from a standard; Beurré Diel, covered all over with cinnamon russet; Beurré Teurlinckx, Poire d'Avril, Eliza d'Heyst, from an espalier, Catillac, Susette de Bavay, from a south-west aspect, Ne Plus Meuris, from a south-west wall, Vicar of Winkfield, nice fruit from a pyramid; Winter Nelis, Rouse Lench, from a standard, and Glou Morceau. A Certificate of Merit was awarded. Mr. M'Ewen, gr. to the Duke of Norfolk, at Arundel Castle, produced a collection of Pears, among which were the following kinds:—Beurré Bosc, Easter Beurré, Beurré Rance, Beurré Diel, Beurré d'Aremberg, Winter Nelis, Ne Plus Meuris, Marie Louise, Old St. Germain, Bishop's Thumb, Vicar of Winkfield, Glou Morceau, and Passe Colmar. The same grower also furnished beautiful specimens of the following sorts of Apples:—Minchal Crab, Scarlet Admirable, White Calville, Shepherd's Seedling, the true Cockle Pippin, Lancashire Reinette, Margil, Royal Russet, Broad-eyed Pippin, Golden Harvey or Brandy Apple, Court Pendu Plat, Dumelow's Seedling, King of Pippins, highly coloured, Hubbards' Pearmain, American Pippin, a sort resembling the scarlet Pearmain, Ribston Pippin, Norfolk Beaufin, Gravenstein, and Blenheim Orange. Mr. Snow produced a trayful of beautiful specimens of the true old Golden Pippin from a west wall, showing that in a warm situation and with the help of a wall this much esteemed fruit can still be had in perfection. Those exhibited were clean in the skin, large, and with no symptom of "wearing out" about them. From M. Langelier, of Jersey, came a large collection of Pears, many of them new kinds, but from being bruised from bad packing, and the numbers under which they were sent being in some instances lost, and in others not corresponding with the list of names to which they should have belonged, it is impossible to give any particular account of them here. Of well-known kinds there were a few fair specimens, but on the whole they were not equal either in size or colour to any of the English collections in the room. The only exception to this statement was the Beurré Diel, which had a rich warm red colour, not possessed by any of the English specimens of this Pear.

Of Pine Apples, Mr. McEwen sent a specimen of Cayenne weighing 5 lbs. 7 oz., for which and for his col-

lection of Apples, mentioned above, a Silver Knightian Medal was awarded. Mr. Fleming, gr. to the Duke of Sutherland at Trentham, sent three Montserrats, weighing respectively 4 lb. 4 oz., 4 lbs. 4 oz., and 3 lbs. 13 oz., and a Prickly Cayenne weighing 5 lbs. 4 oz. A Banksian Medal was awarded. Mr. Brown, gr. to J. Parnell, Esq., of Waltham Abbey, had a Queen, 3lbs. 10 oz., for which a Certificate of Merit was awarded; and a similar award was also made to Mr. Jones, gr. to Lady Charlotte Guest, for a Ripley Queen weighing 4 lbs.

Of Grapes, remarkably fine basketfuls both of Muscats and Black Hamburghs were furnished by J. C. Nash, Esq., of Bishop's Stortford, whose success in the cultivation of this fruit has now become proverbial. The two varieties in question were perfect both in bunch and berry — in every respect equal to Mr. Nash's exhibitions of the same kinds in former years, a fact which speaks well for the mode of management adopted, and for the lasting properties of the border, a full account of the construction of which will be found in our volume for 1847, p. 683. A Banksian medal was awarded. Mr. Snow showed a bunch of the late keeping Black Barbarossa Grape, weighing 4 lbs. It could not measure less than 18 inches in length and a foot across the shoulder; and the berries were plump and well coloured. A Banksian medal was awarded it. From Mr. South, gr. to A. H. Davenport, Esq., came four well ripened bunches of the White Syrian Grape, for which a Certificate of Merit was awarded. It was mentioned that the flavour of this Grape is much improved by allowing it to hang on the Vines till it is thoroughly ripe, which is many weeks after it has become transparent, and apparently ready for cutting. Mr. Hill, gr. to R. Sneyd, Esq., received a Certificate of Merit for three bunches of Muscats, and a similar number of Black Hamburgh Grapes, both of which were a little past their best. Mr. Miller, gr. to Sir W. Smith, Bart., had three bunches of Muscats large and well grown; but greatly rubbed from travelling, and in some of the bunches there were bad berries. Mr. Fleming sent some Citrons full grown, but green—a condition in which they were said to be most liked for confectionary.

Of Chrysanthemums, Mr. Robinson, gr. to J. Simpson, Esq., again showed a fine collection, although this time they were a little past their best. All of them were Pompones, except Anne Salter and Fleur de Marie; the latter, a White Anemone kind, was just in perfection. A Knightian Medal was awarded. A boxful of cut blooms of Chrysanthemums, without names, came from Mr. Spary, of Hardwick, Worksop, Notts.

Other plants consisted of a beautiful specimen of the brilliant crimson-flowered Sericographis Ghiesbreghtiana from Mr. Fleming, of Trentham, who received for it a Certificate of Merit. It was growing in a hard green-glazed pot, or rather deep green glass basin, in which plants are found to thrive equally well as in the common porous garden-pot. Along with it was also a small plant of Dracæna terminalis, in a clear glass pot, through whose sides could be seen the soil, drainage, and roots. Messrs. Henderson, of Pine-apple Place, exhibited a specimen of Hebeclinium aurantiacum, a Mexican plant with brilliant orange Marigold-like flowers, which although not produced in very great profusion are very ornamental at this season, and from the number of buds still unexpanded it looked as if it would keep on flowering for some time to come. It may, therefore, be a useful winter warm greenhouse plant for cutting. A Certificate of Merit was awarded it.

The dearth of Russia mats has caused people to look for other kinds of winter protections to supply their places, and among other things the old kind of coverings made of long Wheat straw woven together with tar twine has been found to be a cheap and good substitute. These were wont to be made on a floor or bench; but it occurred to Mr. Brewer, of Pine-apple Place, that a better way of making them than that might be devised. He accordingly invented a contrivance for the purpose, a model of which he exhibited. It resembled a small clothes-horse with upright spars in it, to which was fastened a slight wooden frame by means of moveable pins. Between these two frames the covering is woven, each succeeding tier of straw being thus kept in its place till it has been tied by the tar twine, and when the frame has been filled with made-covering the moveable pins are withdrawn and the covering allowed to slip down, leaving the frame empty and ready to be filled again. The advantage of the contrivance is that it allows the operator to stand upright and thus to work with greater ease and speed. In this way it was stated that a straw covering 4 feet wide and 6 feet in length, and equal, as far as protection from frost is concerned, to a double mat, could be made for 9*d.*, including labour and material. A Certificate of Merit was awarded to Mr. Brewer for his contrivance.

Dr. Lindley announced that an entire change in the manner of conducting these meetings had been decided upon by the Council; the nature of which change would be explained in the printed schedule, a few copies of which were distributed.

From the garden of the Society came a collection of Chrysanthemums, the beautiful large yellow-flowered Linum trigynum, Echeveria retusa, a nice specimen of Begonia incarnata, the little yellow-flowered Calceolaria ericoides and other plants, together with fruit of Glou Morceau and Passe Colmar Pears.

Pomological, *Dec.* 4.—Mr. Johnson in the Chair. This was an ordinary meeting for the election of members, of which the names of several new ones were added to the list, and for settling some small matters of detail connected with the future management of the Society. The only fruit exhibited was a collection of Apples, many of them Cider sorts, from Herefordshire, and among which none were found to be better than the old Foxwhelp. Among kinds for dessert there was nothing remarkable, except it was a very fine specimen of the Brandy Apple, or Golden Harvey. This was a highly-coloured and beautiful fruit of this deservedly much esteemed variety.

Notices of Books.

Archer's First Steps to Œconomic Botany (Reeve), announced as published for the department of Science and Art at Marlborough House, is a contribution to a knowledge of common things founded upon the author's former book upon the same subject. Such works are calculated to do much good; but to effect this they must be accurate even in small matters, or their tendency will be the reverse of what is proposed. For instance, in speaking of feculæ the exploded term hilum should not have been employed, for it leads to totally false ideas of the origin of fecula. Nor should the Cowslip flavour of certain kinds of tea be referred exclusively to the introduction of flowers of Olea fragrans; we know that they are said to be thus used; but we never yet saw them in a sample of tea; whereas it is notorious that the Chulan or Chloranthus is generally employed for the purpose, as, indeed, is evident from the large quantity of its fragments contained in samples of Cowslip teas. In like manner, the account of Indian tea cultivation is a mere tissue of errors and misconceptions. We regret to find it our duty to make these observations; but it is clear that if works having official sanction are not more carefully prepared, the rising generation will have to unlearn as fast as possible much of what it has learnt in modern places of education.

A Popular History of British Mosses, by R. M. Stark (Reeve), is an acceptable addition to the store of illustrated works on Natural History, and will doubtless become as popular as the subject to which it relates. In a square 12mo of 322 beautifully printed pages, Mr. Stark has given as full and instructive an account of our wild Mosses as can well be desired. It is founded avowedly upon the long labours of Sir Wm. Hooker in the same direction, and this alone guarantees the soundness of the author's systematic views. All the genera and species of "Moss," as that term is understood by botanists, are clearly but succinctly described in the English language, and to aid the learner in understanding the subject, we find 20 coloured plates admirably executed by Mr. Fitch. When we add that the work has a good index the reader will require no further assurance that it deserves to be strongly recommended. Nothing would be better suited for a Christmas present for young people.

Page's Introductory Text Book of Geology (Blackwood) is another contribution to this popular science. Those of the same class recently published are all so good in their way that the best advice we can give to a student is to buy them all. They are cheap enough, and as they regard the subject from different points of view, may all be studied with advantage. Mr. Page's is one of the clearest and best digested, and therefore one that particularly deserves commendation. Its fault is that it has no index.

Piscator's Choice and Cookery of Fish (Longmans) has reached a second edition, as its good sense and plain style deserved. We only wish it were possible to make cooks act upon the excellent advice which such books convey.

FLORICULTURE.

The Cineraria.—In reply to the remarks of "*E. T. Edwards*," on my treatment of Cinerarias, I beg to assure him that I was not at all exceeding the mark in stating that my plants are, many of them, from 3 to 4 feet in diameter. They are only tied out just enough to permit the flowers to expand without crowding each other, and the plants are perfectly compact in form. I think the flowers are not at all diminished in size by cutting out the leading flower stem. I can also add, that from my second sowing I have plants which have not been tied out at all, and which will not be in flower before the end of January, which measure 30 inches in diameter. *W.*

The Ranunculus.—I am glad to see your correspondents directing attention to this flower. All who have ever seen a well-conducted bed of the Ranunculus will agree that there is nothing which grows in the open air to surpass it, and that some expense and care are well laid out in procuring one. Yet, how rarely do we find even a moderate collection in the gardens of persons who are otherwise devoted florists. The reason of this is to be found in the great difficulty of preserving the tubers from year to year. A good bed may be easily grown if strong roots are procured from the cultivator, in a plump and healthy condition; but, after one year, it is often found there is a complete failure. The tubers either rot in the ground or they shoot again before they are taken up; or, being stored away, they get mouldy, shrink up, and produce only feeble flowers. The grower becomes discouraged; and as good Ranunculuses are too expensive to be purchased every year, the amateur relinquishes his attempts, and turns his attention to flowers less precarious. Carnations are touchy matters to deal with, but there is more certainty with them than with the Ranunculus; while many fine flowers demand comparatively scarcely any anxiety. But I think the causes of failure intimated above are only such as could be easily overcome, and I make these remarks in the hope of stimulating your readers to make a vigorous attempt in the forthcoming season. A bed of Ranunculuses was a grand exhibition in the time of our forefathers, but modern cultivators have shed upon it still greater glories. The process of hybridising has been eminently successful in producing new varieties, and, what is of more importance, it has thrown a vigorous and healthy habit into a plant particularly liable to degenerate. A bed of the old kinds is covered with scant and feeble foliage, and the flowers, although very lovely, have a frailness of stem and smallness of petal indicative of extreme delicacy. But look at a bed of seedling varieties, and how great is the contrast! The foliage is larger; the stems are robust and tall; and the petals attain a size far beyond that of the more ancient kinds. At first these seedlings are apt to sport an eye, but this disappears by cultivation. There are some situations where it is scarcely possible to grow the Ranunculus successfully, as in dry and gravelly soils; for although this impediment may be partly overcome by the introduction of composts, it can never be quite removed. Such localities are in all their circumstances droughty and uncongenial, and success can only be obtained by considerable practical knowledge, and daily watchfulness. A moist subsoil is indispensable for the successful growth of the Ranunculus, and as it strikes its roots very deeply in congenial situations, the beds should be prepared to the depth of 2 feet some time before planting. The plentiful use of rotted cow-dung is recommended for keeping up a cool moisture in the bed. A thick layer of this at the depth of 18 inches below the surface will be highly beneficial. At the same time a moist soil must not be confounded with a heavy one, for if it is not well drained the Ranunculus will not prosper in it. Marshy grounds, which are the natural habitat of this plant, are spongy and porous, pointing out to us the distinction between light and heavy wet lands. I have always found the Ranunculus to grow best in beds which are thoroughly porous, and yet composed of a soil not disposed to become dry. To preserve the roots wire-worms must be guarded against; and after the foliage decays, no water must be allowed to come on the beds. If you earnestly intend to grapple with the difficulties in the way of securing an annual show you must watch the weather; and if rains come on before you can take up the tubers, protect the beds by some kind of covering. When taken up, lay the tubers in a room perfectly dry, but cool, for if subjected to heat they are apt to shrivel up. It is desirable to retain their plumpness as much as possible, and this can only be done by a gradual process of drying. I prefer placing them in drawers where they can be often looked at to burying them in sand. Dryness and coolness are the requisite conditions for preserving Ranunculus tubers in a state of health until planting time arrives. *S.*

Propagation of Fancy Pelargoniums.—About the beginning of February is as good a time as any for taking cuttings: select some good tops from the very best sorts that are out; get as many thumb-pots as you will require for the purpose; fill them with rich turfy mould, and put one cutting into each pot; but previous to filling the pots let them be well drained with broken charcoal or potsherds; then with a piece of round stick make a hole an inch deep, fill it with silver sand, and then put in the cutting, giving the pot a slight tap on the potting-board to settle the soil; dip a piece of stick into some water, and hold it downwards, in order that three or four drops may fall close to the side of the cutting; this will settle the whole together, and the quantity of water will be quite sufficient for three or four days; after that add a little more in a similar way, or with a fine-rosed watering-pot, as may be thought needful. When you have finished this part of the work, let all the pots be plunged in a slight bottom-heat, say from 65° to 70°; give a little air in the daytime, to prevent the cuttings from damping off. *R.*

Stoke Newington Chrysanthemum Exhibition.—In your report last week of the list of awards in Class 4 for the best 24 cut blooms, a mistake occurs in the address of the exhibitor. It should read thus:—"A silver cup was awarded to Mr. George Taylor, of Stoke Newington," not of Hackney, as has been printed. *G. Taylor.*

Miscellaneous.

M'Glashan's Transplanting Apparatus.—We read in the *Moniteur* as follows:—Some new experiments with a machine for transplanting trees, invented by Mr. Stewart M'Glashan, took place at St. Cloud, by the desire of his Majesty the Emperor, who wished the first trial to be made in the Bois de Boulogne, in order that her Majesty the Empress might honour it with her presence. M. Mathieu, head of the gardens of St. Cloud, directed these experiments, which were as successful as the preceding one. It was tried upon a tree of about 30 feet high, and more than 20 inches in circumference, which even a force of 20 horse power could scarcely have raised from the ground, supposing the preliminary operations all complete, such as removing the earth from around the roots, in order to facilitate the transplanting of the tree. The tree in question was an Acacia, naturally firmly fixed in the soil, its straight roots offering a great resistance, which must

have subjected the machine to a very hard trial Twenty minutes sufficed to uproot and replace the Acacia in its former hole. The principle of Mr. Stewart M'Glashan's machine was so powerful that with an apparatus of reasonable dimensions it would be possible to remove the largest trees, such for example as the Elms and ancient Chesnuts of our public promenades. A third experiment was tried under the direction of M. Mathieu at Villeneuve l'Etang near St. Cloud, upon an Apple tree, which was very difficult to transplant, but the attempt proved perfectly successful.

Materials for Paper.—The Palmetto has long been the great obstacle to Algerian cultivation. It is considered useless to such a degree that large rewards have been offered for its extirpation, which is attended with great difficulty on account of its deep and tough roots. Some Arabian tribes have, however, used the fibres which are furnished by the stem, mixed with camel's hair, for their tent covers; others make baskets of the leaves; and all prepare cordage from the whole plant properly twisted. These usages have called attention to the Palmetto as likely to afford materials for paper, and experiments have been crowned with complete success. Millions of hundredweights can be collected in Africa; the price of a hundredweight of the green leaves would not exceed two francs; and since rags in France are always dear, and cost at present from 20 to 50 francs the hundredweight, it cannot be doubted that the use of this plant will lead to important results. The Palmetto already furnishes a kind of fibre which resembles horsehair, and is very firm and elastic, and is used in great quantities for the manufacture of carpets, under the name of vegetable or African hair. Better sails are made from it than from the Spanish broom, for which it may henceforth be substituted, to the annual saving of large contributions to Spain for raw material. This is, however, not all; for it has lately been discovered that the fibres, divested of the glutinous matter which binds them together, are extremely divisible, and, notwithstanding their inferior length (from 25 to 40 centimetres), are as fine as those of Flax, and can be used for the preparation of Flax-cotton. There are already four kinds of manufactures—paper, carpets, sailcloth, and thread—which are furnished by this plant, which, but a short time since, was regarded in Algiers as a mere scourge. *M. J. B. (Revue de l'Orient, May,* 1854; *quoted in Bot. Zeitung, Aug.* 18, 1854.)

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The winter-flowering Heaths and some of the Epacrises will now be in bloom: these are exceedingly gay plants, and last longer in beauty than most things, but they must be afforded an airy part of the house; for to keep them in a close confined situation for any length of time would be certain ruin to the plants. Some of the early potted bulbs should now be placed in heat, provided they are moderately rooted. A little bottom-heat is of great service to them, and if this can be afforded them in a pit or frame where they will be near the glass, and can be kept cool and airy, they will be found to do much better than if placed in the stove, or any other warm house. Take advantage of every fine day to admit a little fresh air; but do this by opening all the ventilators on the sheltered side of the house a little, and avoid cold currents, which would be most injurious to the tender blossoms of plants that have been brought forward in heat. The Hydrangea japonica variegata is an excellent subject for the decoration of the conservatory in winter, but its fine foliage is somewhat liable to be injured by damp; therefore it should be placed in a dry part of the house, and in watering avoid wetting the leaves. Stove.—Be sparing in the use of fire-heat here for the present, except in the case of things being pushed on with the view of getting them to flower before their natural season; and it is much better to provide a small compartment, which can be managed at will for these, than to overdrive the whole stock at this season on their account. Keep a sharp look out for black thrips, &c., upon Ixoras and other plants making growth, and see to getting the whole collection as thoroughly freed from insects of all kinds as possible; for if these are neglected now they will not fail to be troublesome next spring when it will be difficult to spare time for washing plants, &c. Also see to getting the houses well cleaned, painting, or whitewashing the walls, as the case may be. Greenhouse.—Look well to the management of the fire here, for more mischief is usually done by too much than too little. On frosty nights the temperature need not exceed 38°, and no injury will result if it is allowed to sink a few degrees lower. Give air freely on mild days, and if damp threatens to be troublesome among any of the specimen plants slight fires should be used during the day, when air can be given. Examine Leschenaultias carefully for green-fly, for they are very subject to the attacks of a small species of aphis which at this season very soon disfigures them, and also renders them more liable to be injured by damp. These, with Boronias and Croweas, &c., must be very carefully supplied with water, keeping them rather dry at the root during the winter, and avoiding unnecessarily wetting the foliage, &c., in watering. The Boronias, especially B. serrulata, are very impatient of currents of cold air, and should be placed in the warmest end of the house, and not exposed to cold drying winds. See to getting a good stock of the various kinds of soil used in potting placed under cover where they will be dry and fit for use when wanted; also get plenty of potsherds, broken, and sorted out in sizes, and make every possible preparation for spring when time will be doubly precious with the plant grower. The preparation of stakes and labels should also be seen to whenever the weather is unfavourable for out-doors operations, and the washing of pots should be gone on with.

FORCING DEPARTMENT.

Pineries.—Plants that bloomed late in autumn will require very careful management to prevent their being injured by damp. It is nearly impossible to get fruit to swell properly at this season, therefore unless for the purpose of maintaining a succession of ripe fruit these had better not be hurried until the days become longer. See, however, to affording them a rather dry atmosphere, admitting a little fresh air every fine day. The night temperature may average from 55° to 60°, allowing it to rise a few degrees during the day. Fruit approaching maturity must be assisted with a brisk temperature, say 65° by night and 75° by day. Keep the atmosphere moderately moist until the fruit begins to change colour, after which it can hardly be kept too dry. Also endeavour to have these near the glass, and maintain a healthy root action. Vineries.—As soon as the early house is closed for forcing, be careful to secure a thoroughly moist state of the atmosphere by frequently sprinkling the floors and every available surface, but as observed previously, a regularly moist state of the atmosphere is most effectually secured by means of a slight bed of fermenting materials in the house, which will also afford a little warmth, and the moisture from this is much more congenial to vegetation than anything that can be effected by the most careful use of the syringe or evaporating pans. But the most essential point in successful early forcing is securing a healthy and vigorous root action, and unless this is provided, the best and most careful management of the atmosphere will be of but little importance. An occasional application of water at a temperature of about 90° will greatly assist to infuse warmth into the soil and excite the roots, and there is no good reason why the roots of Vines for early work should not, to a large extent, be inside the house. But where this is not the case give careful attention to the fermenting material placed on the outside border, keeping it well protected from the weather and frequently turned over, and by additions, as may be necessary, endeavour to secure a steady warmth of about 60° at a foot below the surface.

FLOWER GARDEN AND SHRUBBERIES.

The weather is still comparatively favourable for executing alterations; and where these are in hand they should be prosecuted with the greatest possible despatch, taking advantage of frosty mornings, &c., for wheeling. Planting, or the removal of large trees or shrubs, cannot be finished too soon; for it is of the utmost importance that the plants should be afforded some chance of making fresh roots before the trying winds of March. See to even small plants being secured against the wind; for these are often greatly injured by being blown about after planting, which a small stake and a few minutes' work would prevent. Get in a stock of briars for budding upon next season. Let the roots be well trimmed, cutting back closely the strong ones; for these, if left, will be of little use save to furnish an endless supply of suckers. As soon as alterations are completed, and the beds and borders are put into proper order for the winter, let a little fresh gravel be put upon the walks if necessary, in order to render them firm and dry for the winter. The stock of half-hardy plants in pots for next summer's decoration must be freely exposed to the air on every favourable opportunity, and every means used to protect them from damp. Very little water will be required for some time to come, and no more should be given than will suffice to keep the plants from flagging. Keep the surface of the soil clean, and the plants perfectly free from insects.

RISTS' FLOWERS.

Carnations and Picotees.—By no means smother these very hardy plants, they will stand any amount of frost provided they are inured to it. Abundance of air, and a medium state of moisture is a *sine qua non*. Then give air at every favourable opportunity—rain at this season it is as well to avoid. Dahlias.—Examine the tubers, probably the labels may be getting nearly illegible, or the ties decayed; in either case, immediate attention is requisite. Tulips.—Those who had not planted at the time-honoured date (Nov. 9) would have had something to do to find a right period for intrusting their bulbs to the ground; like late sown corn they may occasionally be up to the mark, but we prefer taking time by the forelock.

HARDY FRUIT AND KITCHEN GARDEN.

If any transplanting or root pruning of fruit trees has yet to be done let this be attended to without further loss of time, and see that those exposed to the wind are securely staked before leaving them. Also get the ground prepared for fresh plantations, and the trees planted as soon as possible. Take every opportunity of pushing forward pruning and nailing. Give air freely to Lettuce and Cauliflower plants under glass; indeed the sashes should merely be used to exclude frost, and throw off rains, for they will do all the better in spring for being kept hard and stocky over the winter. If not already done make a sowing of Peas and Beans on well-sheltered dry ground, and do not spare the seed of the former, for it will be some time exposed to the depredations of mice, &c. In favourable localities a second sowing may be made if the first sowing is through the ground. Take advantage of the first dry day that may occur with the ground in a rather dry state to earth up closely any of the Celery that may have outgrown the previous soiling, and be prepared to protect the ridges in case of severe frost. Dry stable litter answers very well for this purpose, but where they can be afforded, light straw or reed shutters are preferable as being more easily applied, causing less litter, and these are also useful in excluding wet. It will soon be time to be providing seed for the early crop of Celery next season, and for this purpose we know no variety equal to Cole's dwarf white. This is, as its name indicates, a dwarf variety, and cannot be grown to a large size, but where quality is preferred to size it will give satisfaction, for it is very crisp, soon blanches, and the flavour is everything that could be wished. Attend to keeping up a regular succession of Seakale, Asparagus, and Rhubarb, by introducing moderate quantities at short intervals into heat.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Dec. 7, 1854, as observed at the Horticultural Gardens.

Dec.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth. 1 foot deep.	Of the Earth. 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 13th, 1842—therm. 61 deg.; and the lowest on the 16th, 1853—therm. 7 deg.

Notices to Correspondents.

American Birch: *Diss.* This hard heavy wood, now so generally used in England, is, we believe, produced by Betula lenta. Plants may be had in such nurseries as Lee's of Hammersmith, or Osborne's of Fulham; or seed may be obtained from the importers of North American tree seed. We will not, however, guarantee its *paying* for cultivation in this country.

Boilers: *R V S.* Use cast-iron, by all means. Their form is not so important as their setting and connection with the pipes. The conical form, either in one piece, or consisting of upright tubes, as Weeks's, are now chiefly used. For other particulars you should apply to those who sell such articles. As to the Pear, you will find 500 as good and 100 better, and more easily procured.

Books: *B Y.* There is not any book on foreign Ferns answering at all to Moore's on "British Ferns."—*E O.* All extensive modern works on horticulture contain the information you seek. The most recent and most complete is Mackintosh's "Book of the Garden," now in course of publication in numbers. We have no experience on the Chichester mode of glazing: but do not see why it should not answer if the work is well executed.—*J W.* Inquire for Lindley's "School Botany." Any bookseller can supply it. ‡

Hollies: *Old Sub.* If you sow yellow Holly berries the trees produced from them are very likely to be yellow berried; but they will not *necessarily* bear berries of that colour. ‡

Liquid Manure: *E H.* Look next week in the Notices to Correspondents on the agricultural side.

Lists of Plants: *Filix.* We are unable to answer your question. Probably your botanical neighbours may know. Enquire of Mr. Stark, who is well able to advise you.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time. — *J S W.* Phaius maculatus. — *Erzeroum.* 75a, Thlaspi strictum; 761, Capparis spinosa; 1296, Lepidium ruderale; 41, Lep. perfoliatum; 760, Cleome ornithopodioides; 1073, Lavatera olbia; and 454, Althæa Kurdistanica.—*E C T.* Ruscus racemosus. There is no such plant as Sophora pinnata; all Sophoras are pinnated.

Names of Fruits: *J Moore, and G S F.* Your Pears are the Beurré Diel. ‖

Quince Stocks: *J S.* We never heard of Peach trees being worked upon Quince stocks. You state that you have written to some of the largest establishments in England respecting "Rider Peach trees on Quince stocks without success; but no one has yet said that they are not to be had on the Quince." We do not suppose that such a union has been attempted in modern times. If a man says he can cross a Thistle with Wheat, do you think others are called upon to deny the possibility of such a feat? Sheer absurdity corrects itself. ‖

Ventilation: *Dublin.* We are not sanguine about your plan of ventilation. Indeed, we doubt whether it would act at all if the walls through which the air is introduced are warm, as they should be. Instead of hollow walls it would be far better to use deep underground drains opening by an upright shaft (closeable by a wooden cap) in the front walk *outside*, and in the inside immediately below and in contact with the back of the hot-water pipes. We should build a stage along the middle of the house and carry a shelf all round. That is all you need.

Vines: *J.* You may graft a Muscat on the Black Hamburgh. It may be done with safety just after the buds have burst into leaf. There will then be no danger of bleeding. ‡

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.

Bridge Street, Blackfriars.

SUPERPHOSPHATE COMPOST COMPANY.—427, Strand, London.

The Directors having received numerous applications for Winter Wheat Manure, have the pleasure to notify to their Friends and the Agriculturists generally, that they have 1000 tons expressly prepared for drilling with Winter Wheat, and now ready for delivery at 7*l.* per ton net cash, that is, payment in one month. Carriage free to any Railway Station or Wharf in London. Further particulars may be obtained of the Agents.

W. W. WATSON, Secretary.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.

WM. INGLIS CARNE, 10, Mark Lane, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.

BURGESS AND KEY,

103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.

103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.

103, Newgate Street, London.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The first Session of 1855 will begin in February. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

John C. Cobbold, Esq., M.P.	William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S.	Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq.	Samuel Morton Peto, Esq., M.P.
Thomas Edward Dicey, Esq.	William Tite, Esq., F.R.S.

William Wilshere, Esq.

Empowered to execute, or to assist Landowners in executing with their own Capital, works of Land Improvement, viz., Drainage, Irrigation, Road-making, Enclosing, Reclaiming, and the Erection of Farm Buildings upon any Estates, under Settlement, Mortgage, or Disability, and without any investigation of Title, to charge the total amount of the outlay and expenses upon the property improved, to be repaid by annual instalments, varying according to the number of years over which Landowners may determine the repayment shall extend.

WILLIAM CLIFFORD, Secretary.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 12th, 13th, 14th, and 15th of December next.

The PRIVATE VIEW and ANNUAL DINNER on TUESDAY, December 12.

There will be SPECIAL TRAINS on all the principal RAILWAYS, full particulars of which will be announced in the Advertisements and Bills of the several Companies.

The Agricultural Gazette.

SATURDAY, DECEMBER 9, 1854.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY,	Dec.	12—Midland Counties Show at Birmingham.
WEDNESDAY,	—	13—Agricultural Society of England.
THURSDAY,	—	14—Agricultural Imp. Society of Ireland.

THE past week has been fruitful of agricultural discussion and excitement. The Smithfield Club has held its annual meeting and exhibition; the London Farmers' Club has met, and listened to one of the most useful papers on land drainage that has yet been written; and Mr. MECHI has read his fourth paper on British Agriculture before a crowded meeting of the Society of Arts. On all these points we have endeavoured to lay before our readers the fullest information that we could. Mr. MECHI's paper will be found in another page: an abstract of that by Mr. BAILEY DENTON, too, is given; and a report of the Smithfield Cattle Show, with the award of prizes. Reports of the discussions which followed the reading of the papers before the Farmers' Club and the Society of Arts, must be postponed till another week. In the meantime, we wish to say one word on the part taken by Mr. MECHI, and towards him, at the two places respectively.

Our readers know that without agreeing with Mr. MECHI on all, perhaps on many, of the points on which he has insisted, the *Agricultural Gazette* has, throughout his career, heartily sympathised with him in his efforts to stir up action and discussion in the agricultural world. His *status* as a farmer and as an agricultural teacher are two altogether different things. If any one wants to see good agriculture, let him visit farms like those of Mr. HUDSON, of Castle Acre, in the south, and Mr. HOPE, of Fenton Barns, in the north—or counties like Norfolk and Lincolnshire in the south, and the Lothians and Fifeshire in the north. After returning (especially from the last-named county, probably the most *wholly* cultivated county in Great Britain) from an excursion to the north in August (when the Turnip fields are as green as Clover and as clean as fallow), or still later (for on the gloomiest day of October, when we last saw Fifeshire, the bright clean stubbles had all the effect of sunshine on the landscape), he will not be disposed—after witnessing the great scale, orderly arrangement, and perfect management of all the operations of agriculture—to rank a small farm in a poor district, with an ill-arranged set of buildings, very high in the agricultural scale. And yet its tenant is pursuing there a costly course of agricultural experiment—with what of good management, or of neatness and practised skilfulness we do not say—with how much energy and earthiness, and public spirit, everybody knows; and he is publishing his results not merely quietly and through the press, but by public speech and cordial intercourse and well-sustained controversy, through evil report and through good report, without abatement of an inexhaustible good-nature by the one, without a slackening of his efforts or temptation to relaxation of his labours by the other.

Whatever may be the general opinion of Mr. MECHI's status as a farmer, we are sure that but one exists as to his usefulness as an agricultural agitator and teacher. It was therefore with great satisfaction that, notwithstanding the independent criticism and opposition which many of his statements received last Wednesday at the Society of Arts, we heard every speaker in succession bear testimony to the valuable services which he has rendered. And it was with great regret that, notwithstanding the life and spirit he has so often thrown into the discussions before the London Farmers' Club, we heard last Tuesday evening, at the meeting of that club, a personal attack upon him and his errors, which, if an even-handed justice had guided the discussion, would at once have been stopped as out of order, or if an intelligent and well-conditioned spirit had influenced the speaker would never have been uttered. The attack was not sympathised with by the majority of the members of the Society; if it had been, Mr. MECHI would, no doubt, not again expose himself to the like; and, in that, we are sure that many others would follow his example to indicate their sympathy with him, not as an agriculturist but as a gentleman.

HAVE any of our readers ever undertaken the investigation of pedigrees? In the case of the *human* subject there is generally sufficient interest hinging upon the result of the inquiry to maintain a perseverance in what is, in itself, one of the dreariest and most laborious of researches. And to this may be added that we have not there to contend with one prolific cause of puzzle and perplexity in tracing animal descent, namely the reappearance of the same individual in half a dozen different generations in the same genealogical tree.

In the spring of this year we had the advantage of inspecting the herd of short-horned cattle at Hendon Farm, in the occupation of J. S. TANQUERAY, Esq.; we went there intending to report to our readers all that we should see and learn of the very skilful management, well-regulated appliances, and valuable stock for which Mr. TANQUERAY's farm is known. The herd itself, one of the largest and most valuable in the kingdom, has been gathered together during the past six years, and is necessarily still somewhat mixed and heterogeneous. It is not yet in the position in which the herd of many an older breeder exists—with a uniform character and family likeness impressed upon the whole. Blood of various tribes of the great short-horn family is found, not as it may be hereafter, in the same, but in *different* animals; and of course we cannot yet speak of the Hendon herd as possessing any known characteristic quality—such as is indicated when we speak of Mr. BATES's blood, or Mr. BOOTH's.

Our idea was to take COATES's herd book in hand and study the individuals of this herd, tracing them back as far as possible so as to ascertain their relationship and origin, and so make ourselves and readers better acquainted with the history of the great short-horn breed of cattle which is doing so much to increase the agricultural wealth of Great Britain. For this purpose we took down the names of all the cattle, upwards of 100, and the references to the herd-book which should identify them there, and we set to work in the case of one which was soon to leave us for America, where he has since arrived, and which was one of the most valuable of the many costly animals sold at Lord DUCIE's sale 15 months ago. If we have not long before this carried out our intention of reporting fully on this stock, it has been because of the labour we found connected with this one animal. Sitting down to our task at 9 A.M. it occupied us till midnight, with a three hours' interval, to record the names, where known, of the ancestors of this one animal, to only the 10th generation back. And a similar task in reference to every other in this herd would have occupied us from spring time on till Christmas, even though no 10 hours' bill interferes to restrict labour of this kind within a reasonable period daily.

Let us, however, give the result of this inquiry in the case of this one animal, as that will throw considerable light on the history of the breed, especially in one of its most valuable families. This bull, the Duke of Gloucester, is descended from its gr. gr. gr. gr. gr. gr. gr. g. dam Duchess 1st, or

"young Duchess," sold at CHARLES COLLING'S sale in 1810 to Mr. BATES. As pedigrees are ordinarily worded, its dam was Duchess 59th by Second Duke of Oxford (9046) :—

"g. d. (Duchess 58th) by Second Duke of Northumberland (3646),
gr. g. d. (Duchess 51st) by Cleveland Lad (3407),
gr. gr. g. d. (Duchess 41st) by Belvedere (1706),
gr. gr. gr. g. d. (Duchess 32d) by 2d Hubback (1423),
gr. gr. gr. gr. g. d. (Duchess 19th) by Hubback (1423),
gr. gr. gr. gr. gr. g. d. (Duchess 12th) by The Earl (646),
gr. gr. gr. gr. gr. gr. g d. (Duchess 4th) by Ketton 2d (710),
gr. gr. gr. gr. gr. gr. g. d. (Duchess 1st) by Comet (155),
gr. gr. gr. gr. gr. gr. gr g. d. by Favourite (252),
gr. gr. gr. gr. gr. gr. gr. gr. g. d. by Daisy Bull (186)
gr. gr. gr. gr. gr. gr. gr. gr. gr. g. d. by Favourite (252),
gr. gr. gr. gr. gr. gr. gr. gr. gr. gr. g. d. by Hubback (319),
gr. gr. gr. gr. gr. gr. gr. gr. gr. gr. gr. g. d. by Mr. J. Brown's Red Bull (97)."

But these names represent but a very small portion of the blood to which its quality as a short-horn bull is owing. It had, of course, two ancestors in the first generation, four in the second, eight in the third, and so on, up to 1024* in the 10th generation to which we have traced it; and every one of these animals has affected its character. What that character is may be gathered from the fact that the Duke of Glo'ster sold at Tortworth for 682*l.* 10*s.*—that its sire, Grand Duke, has been sold for 1000 guineas, and its dam for 367*l.* 10*s.*—that its calf, six months old, the fifth Duke of Oxford, sold for 315*l.*—and that its calf Duchess 70th, six weeks old, sold for 325*l.* 10*s.* And now let us see what has produced this quality. One of the four cows in the third generation backwards from which, through "Cleveland Lad" (3408), he descended was an animal (Matchem cow) almost without a pedigree; that is to say, its dam was by young Wynyard (2859), and that is all that is known about her. The cow herself was once offered for 11*l.* in Darlington market, and brought home again for want of a purchaser!—and in the opinion of all other breeders, Mr. BATES was doing immense mischief when he introduced her into his herd. The cross, for such it was to all intents and purposes, was, however, maintained with Mr. BATES's characteristic resolution, and the animal having been selected by the wonderfully educated or perhaps intuitive skill which characterised him, the result has been most beneficial. Matchem cow was got by Matchem (2281); and *he* was by Bonnyface (807) *or* St. Albans (1412), so *there* again is an uncertainty in the pedigree; Matchem's dam was by Farmer (261), and Farmer was by Bumper (101), out of a cow entirely unknown: so that, altogether, Matchem cow was a most exceptional sort of animal—which only a resolute and confident judgment such as Mr. BATES's would have ventured on introducing into a pure bred herd of short-horns.

We refer to this case as an instance in which a well selected cross has wonderfully improved the breed, and saved it from the evils of in-and-in breeding which would inevitably have shown themselves in Mr. BATES's herd, as they will wherever the practice is closely followed. For in the history of this one bull—Duke of Glo'ster—there is parentage from every conceivable (for closeness) relationship between the dam and sire, the same animal occurring over and over and over again in many successive generations, and the same blood being crossed by the same, as many successive times. To take an instance in the bull Favourite (252), which has had more influence on the short-horn breed than any other animal known. There were 32 cows and bulls in the 6th generation back from Duke of Glo'ster—*one* of them is by Favourite: there are of course 64 cows and bulls in the 7th generation, and of these 28 are by Favourite: there are 128 cows and bulls in the 8th generation, and of these 97 are by Favourite. There are 256 in the 9th generation, and of these no fewer than 141 are by Favourite! And its blood existed in generations before that, so that even these figures do not represent the full extent of his influence on the character of the Duke of Glo'ster. To repeat it, so far as we know, however, we may just say that every animal in the 1st generation contributes of course one half, in the 2d one quarter, in the 3d one-eighth, to the character of any animal whose pedigree is in question: and calculating the matter on these principles, carefully avoiding all counting over again of animals in the same line, we find that there is $\frac{1}{128}+\frac{27}{256}+\frac{95}{512}+\frac{140}{1024}$ of Favourite's blood in the Duke of Glo'ster $=\frac{272}{512}$, or nearly one-half!!

Much more might be added, but we have already filled our space. We shall probably return to this subject, although our present reference to it has had the effect, we think, of proving several interesting points: (1) the immense quantity of other blood mixed up in the line of the so-called Duchess tribe; (2) the degree of doubt and impurity in the most pure and certain of all the short-horn families; and (3) the very interesting light which yet remains to be thrown upon the practice of our most successful breeders.

* These numbers represent names rather than separate individuals, for many, both cows and bulls, may have had as offspring several individuals in any one generation. At the time of so distant a generation as the 10th, there were not 1000 pure bred short-horns in the kingdom.

SMITHFIELD CLUB CATTLE SHOW.

THE Bazaar was opened on the evening of Monday for the private view, an opportunity which was made use of by remarkably few visitors; and the number on the succeeding days has not equalled that of last year's meeting. The exhibition is, however, equally attractive: to the mere amateur more so than ever, and to the professional man as well. For the former, the elegant forms of the Devon and the Down, the most beautiful of breeds in cattle and sheep respectively, never appeared either in equal perfection or in such numbers. For the latter there are matters just as usefully demanding his attention, whether in satisfaction or regret. He finds as much to attract his notice among the implements upstairs; and among the cattle, sheep, and pigs, he has pressed upon him such matters as the *relative merits of breeds* (for notwithstanding that Devons, Herefords, and Short-horns are separated now, yet there are the medals for the best cow and ox respectively in the yard, for which they still come into mutual competition; and the Short-horns have now for three years in succession carried off the palm). There is also the *progress of individual breeders*, and the decadence of others. We can observe the entrance of new names, and the gradual progress of well-known ones—how Lord Walsingham's sheep are obviously year by year gaining in quality and weight, and his Grace the Duke of Richmond's too, whose young Down sheep are astonishing; and there are matters connected with breeding generally, as, for instance, in the cross-bred classes, where there is a singular illustration of the *relative influence of the male and female parent* on the character of the offspring—the bull in every instance impressing his character on the cross to the almost entire absorption of the influence of the dam, Lord Radnor's cross-bred Hereford and Short-horns being to all appearance pure bred Herefords, while Mr. Hewer's Short-horn and Hereford—which, however, is not a half and half cross—being apparently a Short-horn. The *cross-bred sheep*, too, were well deserving notice, and Mr. Druce, of Oxfordshire, who deserves great credit for his energy and success in enforcing the profitableness of the cross-bred Down and long-woolled sheep, has worthily carried off the first prize in his class. It is in a case of this kind that the relative spheres of the Smithfield Club and the Royal Agricultural Society of England come under observation. The former rewards well-made fat meat, and encourages agriculture through the feeder, the latter aims at the agricultural interest through the breeder exclusively. The English Agricultural Society therefore does not offer prizes for cross-bred animals. Nothing is more clearly made out in agriculture than that *bold* crosses will not last; the first cross is a good animal and profitable to its breeder and its feeder; but if you breed from him he will revert to a degenerate copy of one or other of his parents. The cross-bred animal may therefore be properly the subject of a prize offered by the Smithfield Club; while the Agricultural Society do well to encourage the pure bred animals, without which the cross cannot be had. There is one more point on which the two societies come into contact, or more properly antagonism. The former offers prizes for young cows and heifers—"Short-horn heifers not exceeding four years old, &c.," "Short-horn cows above four years, that must have had at least one live calf, &c.;" and there are 17 animals shown in these two classes. The ages of the heifers are from 3 years and 8 months to 3 years and 10 months; those of the cows from 4 years to 8 years. Now, we are sure that there is no one interested in the progress of agriculture but must regret to see pure bred cows and heifers of so valuable a breed find their way to the butcher with so little fruit, or none at all, as is the case in many of the instances shown here. Take, for instance, No. 89, the cow "Alice"—the best cow in the yard—purchased as a calf by Mr. Towneley, the gentleman who protested against Lord Ducie's rule for a previous examination of the animals shown in the English Agricultural Society's yard by judges of fat, in order that excessively fat stock might be rejected. This cow, Alice, has had one calf, and it died as soon as it dropped, we believe; we understand she was exhibited at the Lewes Show, and Mr. Towneley has never bred from her since, or, indeed, at all, and she is now fat meat—so fat, indeed, that with her excessive covering, all, and evenly, over the upper part of her body, and her somewhat scantily covered legs and thighs, she reminds one of those locomotive engines carrying on their cylindrical boiler an additional coating in the shape of a reservoir for water which keeps the boiler warm. If this animal would breed, she is worth 200*l.* or 300*l.*: she has been as fat as she is for the last four years, no doubt as the result of natural character in a great measure, but also no doubt to some extent as the consequence of the over-fattening system in the commencement: and we imagine that "Alice" might be made the text of a very impressive sermon to her breeder and feeder, if they would only listen to it. The award of prizes is given below; but we may, in addition to the mere announcement of the judgment by which it has been guided, just make a remark or two as we walk round.

No. 2, the first prize Devon ox under three years old, is bred by H.R.H. Prince Albert; it is a remarkably compact well got up little thing, *polished* to the very tips of its horns, which, by the way, are hardly of the Devon character. The most elegant and beautiful specimen of an animal in the yard, perhaps, is No. 25, the first prize Devon heifer, by the Earl of Leicester, somewhat lighter in colour, beautifully fine in bone, horn, and muzzle; it is a remarkably fine specimen of the Devon breed.

As to the Hereford classes, they are, we believe, hardly up in quality to those of former years. The first prize ox, shown by Mr. Niblett, of Bristol, is a well-bred remarkably evenly fattened ripe ox, very thick in the flesh all over, especially on the parts most valuable to the butcher. No. 36, which received the 2d prize, was bred by Prince Albert, and is a large compact beast—somewhat coarser than its neighbour, but remarkably thickly covered with useful flesh.

In the Short-horn classes the oxen under three years old are inferior to their usual character; the 1st prize animal in the older class, 4 years and 4 months old, was probably never excelled in quality; very fat but evenly so; extraordinarily thick in the twist and rump, and very fully covered on all the most valuable parts. The Short-horn heifers and cows have been already referred to. In the class for oxen of any other pure breed the prize was awarded to a long-horn ox, inferior as it seemed to us in quality, form, ripeness, and age, to the very well made younger Sussex ox by its side, and we should like to know the grounds of the decision between them.

In the sheep classes we have merely to say that there was a very fine show of South Down sheep, a comparatively inferior show of long wools, and a very good display of the cross between them.

The classes of pigs were represented not by any great number, but certainly by remarkable quality. The classes were more evenly matched in size than we have known them. The large classes were nearly of one size, and the small one also nearly matched in size and also in quality, for the judges must have had a very difficult office here. We give their awards below. We have the measurements of all the cattle shown, and shall hereafter use them, and compare them with those of the Birmingham cattle next week, and make use of them for elucidating other points in reference to the history and progress of the breeds :—

AWARD OF PRIZES.

CATTLE.

Class I. Devon Steers, not exceeding 3 years old.—1st, 25*l.*, his Royal Highness Prince Albert; S. M. to the breeder, R. Mogridge, Molland, South Molton. 2d, 10*l.*, Walter Farthing, Stowey Court, Bridgewater.

Class II. Devon Steers or Oxen, above 3 years old.—1st, 25*l.*, the Earl of Leicester, Holkham Hall; S. M. to the breeder, the Earl of Leicester. 2d, 10*l.*, Fred. King, Nursling, Southampton.

Class III. Devon Heifers, not exceeding 4 years old.—1st, 15*l.*, the Earl of Leicester, Holkham Hall; S. M. to the breeder, the Earl of Leicester. 2d, 5*l.*, his Royal Highness Prince Albert.

Class IV. Devon Cows above 4 years old, that must have had at least one live calf.—1st, 20*l.*, John Hudson, Castle Acre Lodge, Swaffham, Norfolk; S. M. to the breeder, John Hudson. 2d, 10*l.*, Thos. Bond, Park, North Petherton.

Class V. Hereford Steers, not exceeding 3 years old.—1st, 25*l.*, Isaac Niblett, Filton, Bristol; S. M. to the breeder, T. L. Meire, Cound, Shrewsbury. 2d, 10*l.*, his Royal Highness Prince Albert.

Class VI. Hereford Steers or Oxen, above 3 years old.—1st, 25*l.*, Wm. Heath, Ludham Hall, Norwich; S. M. to the breeder, Thomas Carter, Dodmore, Ludlow. 2d, 10*l.*, J. Ford, jun., Rushton, Dorset.

Class VII. Hereford Heifers, not exceeding 4 years old.—1st, 15*l.*, Fred. King, Nursling, Southampton; S. M. to the breeder, T. Samson, Kingston Russell, Dorchester.

Class VIII. Hereford Cows, above 4 years old, that must have had at least one live calf.—1st, 20*l.*, Wm. Heath, Ludham Hall, Norwich; S. M. to the breeder, Edward Longmore, Ludlow. 2d, 10*l.*, John Stevens, Holywell Street, Oxford.

Class IX. Short-horned Steers, not exceeding 3 years old.—1st, 25*l.*, Jas. Futcher, jun., Fovant, Salisbury; S. M. to the breeder, the Right Hon. Sidney Herbert, M.P., Wilton, Salisbury. 2d, 10*l.*, Wm. Aldworth, Frilford, Berks.

Class X. Short-horned Steers or Oxen, above 3 years old.—1st, 25*l.*, the Duke of Rutland, Belvoir Castle; S. M. to the breeder, the Duke of Rutland. 2d, 10*l.*, the Rev. J. Holmes, Brooke Hall, Norwich.

Class XI. Short-horned Heifers, not exceeding 4 years old.—1st, 15*l.*, Joseph Phillips, Ardington, Berks; S. M. to the breeder, Wm. Fussell, Laycock, Chippenham. 2d, 5*l.*, the Earl Spencer, Althorp Park.

Class XII. Short-horn Cows, above 4 years old, that must have had at least one live calf.—1st, 20*l.*, Charles Towneley, Towneley Park; S. M. to the breeder, Alex. Bannerman, South Cottage, Chorley. 2d, 10*l.*, J. H. Langston, M.P., Sarsden House, Chipping Norton.

Class XIII. Scotch or Irish Steers or Oxen, of any age.—1st, 10*l.*, J. H. Gurney, Catton Hall, Norwich.

Class XIV. Scotch or Irish Heifers or Cows, of any age.—1st, 5*l.*, Hugh Hamilton, Lindsay, Westdean.

Class XV. Welsh Steers or Oxen (Runts), of any age.—1st, 10*l.*, B. E. Bennett, Marston Trussell Hall.

Class XVI. Welsh Heifers or Cows, of any age.—1st, 5*l.*, Richard Worthington, Saddington.

Class XVII. Steers or Oxen, of any pure breed (except Devons, Herefords, Short-horns, and Scotch, Welsh, or Irish), of any age.—1st, 10*l.*, R. H. Chapman, Upton, Nuneaton; S. M. to the breeder, R. H. Chapman.

Class XVIII. Heifers or Cows, of any pure breed (except Devons, Herefords, Short-horns, and Scotch, Welsh, or Irish), of any age.—1st, 10*l.*, Charles Neame & Sons, Selling; S. M. to the breeders, Charles Neame & Sons.

Class XIX. Cross or Mixed-bred Steers, not exceeding 3 years old.—1st, 15*l.*, the Earl of Radnor, Coleshill House; S. M. to the breeder, the Earl of Radnor.

Class XX. Cross or Mixed-bred Steers or Oxen, above 3 years old.—1st, 15*l.*, William Hewer, Sevenhampton; S. M. to the breeder, William Hewer.

Class XXI. Cross or Mixed-bred Heifers, not exceeding 4 years old.—1st, 10*l.*, John Tucker, Abbey Print Works; S. M. to the breeder, John Tucker.

SHEEP.

Class XXII. Fat Wether Sheep, of any Long-woolled breed, 1 year old (under 22 months).—1st, 20*l.*, the Marquis of Exeter, Burghley Park, Stamford; S. M. to the breeder, the Marquis of Exeter. 10*l.*, G. S. Foljambe, Osberton Hall; 5*l.*, Thomas Twitchell, Willington.

Class XXIII. Fat Wether Sheep, of any Long-woolled breed, 1 year old (under 22 months). Each Sheep not to exceed 220 lbs. live weight.—20*l.*, G. S. Foljambe, Osberton Hall; S.M. to the

breeder, G. S. Foljambe. 10*l.*, the Marquis of Exeter, Burghley Park, Stamford; 5*l.*, Richard Newman, Harrowden.

Class XXIV. Fat Wether Sheep, of any Long-woolled breed not Leicesters), 1 year old (under 22 months).—10*l.*, William Slatter, Stratton, Cirencester, Gloucester. S. M. to the breeder, William Slatter.

Class XXV. Long and Short-woolled Cross-bred fat Wether Sheep, 1 year old (under 22 months).—10*l.*, Samuel Druce, Eynsham, Oxford. S. M. to the breeder, Samuel Druce. 5*l.*, John Overman, Burnham Sutton, Norfolk.

Class XXVI. Long and Short-woolled Cross-bred fat Wether Sheep, 1 year old (under 22 months). Each Sheep not to exceed 220 lbs. live weight.—10*l.*, John Overman. S. M. to the breeder, John Overman.

Class XXVII. Fat Wether Sheep, of any Short-woolled breed 1 year old (under 22 months).—20*l.*, the Duke of Richmond, Goodwood. S. M. to the breeder, the Duke of Richmond. 10*l.*, Lord Walsingham, Merton Hall.

Class XXVIII. Fat Wether Sheep, of any Short-woolled breed, 1 year old (under 22 months). Each Sheep not to exceed 200 lbs. live weight.—10*l.*, William Rigden, Hove, Brighton. S. M. to the breeder, William Rigden.

Class XXIX. Fat Wether Sheep, of any Short-woolled breed, 2 years old (above 22 and under 34 months).—20*l.*, the Duke of Richmond. S. M. to the breeder, the Duke of Richmond. 10*l.*, Lord Walsingham, Merton Hall.

Class XXX. Fat Wether Sheep, of any Short-woolled breed (not South Downs), 1 year old (under 22 months).—10*l.*, William King, Mew Hayward Farm. S. M. to the breeder, William King.

PIGS.

Class XXXI. Pigs of any breed, above 13 and not exceeding 26 weeks old.—10*l.*, J. V. Williams, Haygrove Farm. S. M. to the breeder, J. V. Williams. 5*l.*, Wm. Mills Barber, Langley Broom.

Class XXXII. Pigs, of any breed, above 26 and not exceeding 52 weeks old.—10*l.*, John Coate, Hammoon, Dorset. S. M. to the breeder, John Coate. 5*l.*, Samuel Druce, Eynsham.

Class XXXIII. Pigs of any breed, above 12 and under 18 months old.—10*l.*, Samuel Druce, Eynsham. S. M. to the breeder, Samuel Druce. 5*l.*, Stewart Majoribanks, Bushey Grove.

GOLD MEDALS.

Gold Medal to the feeder, for the best steer or ox in any of the Classes. The Duke of Rutland, Belvoir Castle, Grantham, Lincoln.

Gold Medal to the feeder, for the best heifer or cow in any of the Classes. Charles Towneley, Towneley Park, Burnley.

Gold Medal to the feeder, for the best pen of long-woolled sheep in any of the Classes. The Marquis of Exeter, Burghley Park.

Gold Medal to the feeder, for the best pen of one year old short-woolled sheep in any of the Classes. The Duke of Richmond, Goodwood, Chichester.

Gold Medal to the feeder, for the best pen of pigs, in any of the Classes. J. V. Williams, Haygrove Farm, Bridgewater, Somerset.

EXTRA STOCK.

S. M. for the best beast in extra stock. Lord Feversham, Duncombe Park, Helmsley, York.

S. M. for the best long-woolled sheep in extra stock. William Sandy, Holme Pierrepoint, Nottingham.

S. M. for the best cross-bred sheep in extra stock. George Hine, jun., Oakley, Bedford.

S. M. for the best short-woolled sheep in extra stock. William Rigden, Hove, Brighton.

S. M. for the best pig in extra stock. His Royal Highness, Prince Albert.

We must add a few words on the implement show, which was as full and interesting as ever. Implements of tillage and of carriage and for sowing and for reaping were not so numerous as those connected with the preparation of food—chaff-cutters, corn-knives, grinding-mills, Turnip-cutters and graters, steaming apparatus, &c. And this was rightly in accordance with the period of the year, and the interests of the farmer at the winter season. There were a number of root graters, which hardly amounted to pulping machines, but yet effected so far a reduction of the root that it might be more thoroughly incorporated with chaff, meal, &c., for food. Perhaps the most effectual one was Philips's, which results in a mincing of the Turnips, whereas all the others, as Bushe and Barter's, merely act by cutting or scraping off a thin riband-shaped piece. We do not believe, however, that the process of mincing or pulping is worth, in its result, the enormous amount of labour that must be spent upon it.

Among the other machines exhibited, we may mention Williams's Patent Self-holding Lever Plough, which we refer to simply as, in our opinion, an extravagant attempt to combine a lot of ploughs or other implements in one, without any advantage arising from such combination to compensate for the cumbrous bulky awkwardness of so large an implement. There is considerable mechanical ingenuity displayed in its construction, but we do not think it is likely to displace either the plough or the cultivator. We may also name as a novelty Mr. Peirce's (73, Mark Lane) spring shaft cart, and car, in which a trussed shaft is used as a cart bed in place of springs.

Besides stands on which the implements of most of our agricultural machine-makers were represented, the London and provincial seedsmen had many of them stands, on which magnificent specimens, especially of Mangold Wurzel and of Swedes, were exhibited; we did not see the splendid specimens of Cow Cabbage which we had seen the previous year.

Home Correspondence.

The Birmingham Cattle and Poultry Show.—The sixth of the great annual exhibitions of stock and domestic poultry, will open in Bingley Hall, on Tuesday, the 12th inst. The nature and extent of the entries, and the other arrangements which are in progress, are such, we understand, as to hold out abundant promise of a highly satisfactory meeting. The show of poultry—always in Bingley Hall a most agreeable and striking feature—will, it is stated, this year be of extraordinary excellence. Since last year a change has been made in the amount of subscription giving the right to exhibit poultry, which has been raised from 10*s.* to 1*l.*, the entries at the same time being limited to four instead of six as heretofore. Notwithstanding this change, however, the total number of pens will be very nearly 1800.

Farmers improve as much as other People.—Every one in the remotest degree connected with the soil of England must derive satisfaction from the present aspect of the agricultural "interest" emerging gradually from the slough of despond into which it had been so long dragged. Hard was the fate of those on whom fell the first reverses wrought by the political change—a change so sudden that no occupier was prepared to meet it, and against the consequences of which no shield was provided. The farmers were naturally identified with high prices because their rents depended on them; and they thought free trade insisted upon the possibility of paying landlords and labourers out of inadequate receipts: their payments were certain, and if they cultivated their farms with any degree of skill and judgment their expenses could be only extracted from half-fed and hostile consumers by artificial processes, which bewildered and irritated the pauper population;—ever-varying enactments only delayed the day of reckoning; cunning speculators only pocketed the harvest of intricate calculations that always baffled the anxious cares of the simple husbandman: he never knew on what ground he stood, and while he supposed by a sliding scale he could not lose any money, his attention was diverted from the proper exercise of skill and intelligence to acquiesce in any custom or agreement imposed by a "farmer's friend," instead of looking to improvement of cultivation, increase of fertility, or sound economy of management, as the true springs of future welfare. Now that the chill plunge is over into the stream of unrestricted competition, what do we see? Everywhere signs of a new era. The farmer now knows on what he has to depend; his own inherent resolution is called into life, he is determined not to be beaten on his own ground; he cleans his land, he selects his stock, he provides machinery, he stipulates that his landlord shall perform at least a part of his share of the required obligation, and he goes to work like a man of business, no longer propped up by the fiction of high prices, but reasonably calculating on a home market annually more importunate for food. Instead of land going out of cultivation, waste lands are made productive, well husbanded manure converts sand or clay or chalk to an efficient supporter of root crops, artificial grasses tax the credulity of sceptical men who are positively envious at any quicker advance than they themselves can make; and so in honourable rivalry, careless of published accounts of successful achievement, a wonderful spirit seems to animate all classes of farmers in fields hitherto scarcely trodden in the march of improvement, the analyses of soils and succedaneums are followed by the analyses of food. Steam is working its wonders with precision and celerity, railroads and telegraphs aid the traffic of corn and cattle even more than that of cloth and hardware, and a great stride of industry is made in the elevation of all the human agency of agriculture by the constantly increasing exercise of intelligence called forth in every department belonging to the farmer. *J. W., Peterborough.*

Potato Culture.—I send you the result of several years' experience and observation on the cultivation of the Potato. The plan here recommended is simple and inexpensive, and if followed out will prove profitable to the cultivator as well as beneficial to the community, producing sound tubers of superior quality. In order to success four things must be attended to. 1st. A moderately dry friable soil deeply stirred before planting. 2d. No direct application of manure of any kind. 3d. Whole sets of middling size and sound. 4th. A clear space of 20 inches between the sets along drills. I believe all the parts of the above plan have been already tried separately, or partially combined, and by some commended and by others condemned, but in thorough combination it has not been followed out, and as far as I know never before recommended. In this neighbourhood whole sets are condemned because they produce a superabundance of shaws and a multitude of small tubers, the reason of which is they are set too close by one-half. No manure is also condemned, as producing a poor return, but it has been tried only with puny cut sets which have not strength to send up a vigorous stem without the aid of manure. In like manner wide setting is condemned as a waste of ground, and so undoubtedly it is when the sets are small and cut, as they would rarely under any circumstances expand over a space of 20 inches between. I do not attempt to give the *rationale* of the plan; we have already had plenty of theorising, it is enough if success follow its prosecution. A paying crop without a fresh application of manure must always be profitable to the cultivator. *S., Forfarshire.*

Guano, Nitrate of Soda, and Common Salt, for Wheat.—The importance of Mr. Caird's experiments, reported in a recent number of your Paper (p. 765), must be generally appreciated, and would have been, to me, still more interesting if the salt had been applied with the guano instead of with the nitrate of soda; the latter, being itself a neutral salt, with base of soda, appears, chemically, less to require another neutral soda salt than the guano, which is highly alkaline and putrescent. For 10 years I have frequently recommended the admixture of guano with half its weight of tolerably pure salt, or up to its own weight of used pilchard salt, where obtainable; with the view not so much of augmenting the increase in quantity of grain as of improving its quality. The sea-coast Wheats have been long noticed, hereaway, as cleaner and fuller in grain, and stiffer in straw, than those grown inland, and pilchard salt does seem also to increase quantity. The tendency to rot in guano is best remedied by salt, whilst it prevents over growth (but rather retards early vegetation). A mixture of Mr. Caird's three ingredients—1 cwt. each of guano, nitrate of soda, and salt (preferring fishery or other animal-foul salt), would seem to possess a union of qualities likely to produce abundant crops, with clean full grain and firm straw, and leave the ground in a healthy state. *J. Prideaux.*

Manuring Seeds.—I dare say most people know a little sweetmeat called comfits, viz., an Aniseed or something of the sort incrusted with sugar to the size of a Pea, or thereabouts. I have often thought if farmers and gardeners could incrust their seeds in a similar way before sowing, with an artificial manure suitable to their early growth, it would be a saving, and also a greater certainty that all the seeds would be left by birds, &c., to vegetate. Take for instance the Turnip crop in the counties of Northumberland and Durham. It is usual to sow in drills, manuring partly with farm-yard dung and guano, the latter scattered by the hand on the top of the former. Now, besides the irregularity of depth between the seed and guano, a part of the latter is not covered up by the plough, and thereby serves to encourage the early growth of weeds quite as much as the Turnips. I am not aware if this has been tried, but fancy there would be little difficulty in making a small machine to incrust seeds, which would effect a saving in guano. *W. H., Tyneside.*

Cooked Bean-straw as food for Pigs.—In a number of your Paper about a year since a correspondent spoke favourably of Bean-straw cut into chaff, and boiled, and mixed with meal, as being an economical food for pigs. I am now feeding a quantity of pigs, and having for several years past found that pigs have "eaten their heads off" by being fed entirely on meal when put up, in common store condition, to feed, I have determined this year, not being able to obtain grains, and being short of Turnips, to try an experiment with cooked Bean-straw. I have had about a score good sized pigs at feed a fortnight on a compound of Barley-meal and cooked chaff in equal quantity; the chaff is boiled three hours, and mixed while warm with the Barley-meal. The mixture stands about twelve hours. The pigs are fed twice a day, and, so far, it appears to me they have made as much progress as if they had been fed entirely on meal. The pigs consume a bushel of meal each per week. I shall be obliged to the correspondent who noticed the subject last year, or any other who has experience, by any suggestion. Will the pigs become ripe for the butcher on this diet, or should they not rather be finished the last month with meal alone? Will they remain healthy upon it without a change? *R. F. W.*

Italian Rye-grass and Lucerne.—May I beg you will afford me information as to the relative merits of Italian Rye-grass and Lucerne. My lands are situated near the water, scarcely salt, as the estuary runs up here from the open sea some 12 miles; the soil is light, subsoil gravelly, latitude 57.30. I have heard so much of Italian Rye-grass the past 3 or 4 years, and nothing of Lucerne, that I presume that the latter is a more troublesome, expensive, and precarious crop, and more suited to warmer regions, or is it that agriculturists are swayed as much by fashion in crops as ladies are in dress? In your *Gazette* of 1852, p. 588, I observe Messrs. Hardy & Son strongly recommend Lucerne, but I still cannot suppose such men as Kennedy, Telfer, &c., would have grown the Rye-grass if they had not some objection to the other crop, either of relative yield, expense, or climate. Lucerne, it appears, will last from 5 or 6 to 10 or 12 years, whereas the Italian Rye-grass does not exceed 3 years, if so much. If you recommend my trying the Lucerne, I should grow, or rather sow, it after a crop of Potatoes, or Turnips. Could I attempt to sow it in autumn for the spring following? I believe irrigation is very favourable to it, and I have a command of water. *H. W. W.* [We should prefer the Italian Rye-grass. The Lucerne must be sown in spring.]

Lime burned with Peat ("J. W. R.," p. 765.)—Lime is universally burned with peat throughout Ireland, wherever peat is to be had; the kilns for burning it are either what they call pot-kilns, being in form of a gipsy cooking pot, or parallelograms, about 6 feet wide, 5 feet deep, and of any length, with ash-holes along the side most exposed to wind to admit air, and which are placed about 6 feet asunder; the pot-kiln is of any size, but generally about 6 or 7 feet deep and 5 or 6 feet diameter at the top. Neither of these kilns are draw kilns, and although I do not see why peat would not answer as well in draw kilns as coal, yet I do not recollect having seen it used for them. As peat does not make so lasting or so strong a fire as coal, as it is indeed a more bulky fuel, it must be used in much larger quantities, I think about three or four times in bulk of the quantity of stone; and the stone is also broken much smaller than for larger kilns and coal fuel, say about the size of eggs, from pullets to geese. Light brushwood is placed at the bottom of the kiln, and then alternate layers of turf and stone, as where coal is used, but the layers of stone are thinner, that is 3 or 4 inches thick, and the layers of turf about 1 foot or 15 inches thick (this will somewhat depend on the sort of peat used, for both the light fuzzy kind and the hard stone turf answer the purpose equally well). The turves are carefully placed by hand on their ends as close as possible. When the kiln is full it is covered over at top with a layer of turf, but this is more carelessly thrown on. The kiln is lighted, and, when burned, the lime is taken away from the top as it is wanted. The lime is burned well enough in these little kilns with peat for any purpose; indeed, it is as perfectly burned as in the larger kilns with coal. Some years ago, when reclaiming waste lands, I excavated

three very large kilns in a turf bank (it is not an uncommon thing to do this in our bogs, and they serve for some time without any lining of any kind, the moisture of the bog only permitting of a slight charring of the sides), and filled and burned them in the usual way; as dried turf was scarce, when the fire had reached the top and the contents had sunk, I filled the kilns again to the top with layers of stone and raw stuff dug fresh from the bog, and thrown in from the spade. The heat of the under fires dried and ignited this raw stuff, and the stone turned out as well burned as that which had been subjected to the action of the fire from the dried peats. The country people were astonished. *J. M. Goodiff.*

Societies.

Society of Arts, *December* 6.—Mr. Mechi read his fourth paper on Agriculture this evening, and, excepting the introductory paragraphs and a few abridgements elsewhere, the following is a report of it:—

A FOURTH PAPER ON BRITISH AGRICULTURE.

There is something of stern admonition in our present food position. With an abundant harvest, for which we have just returned grateful thanks, the prices of corn are enormous. I venture to assert, from my own experience, that we could grow more than all the food that is required by the British people; but it must be done by investment and improvement. The mere drainage of all the land that requires it would add millions of quarters of corn and much additional meat to our present supply. My own farm may be taken as an instance of greatly and amply increasing our food supply. I therefore purpose this evening to lay before you my own agricultural balance sheet, which is again highly satisfactory and remunerative, showing an advantage to me in rent and profit of about 750*l.* I shall glance at the progress of British agriculture, and enter into some details connected with its internal economy, thinking that such information may be a useful preparative for those who, like myself, hitherto engaged in other pursuits, may be disposed to divert some portion of their capital to agricultural practice and amendment. I do not know anything more rational and more desirable than that the surplusage of our town and city profits should find useful employment on the land. It is much needed.

The agricultural cry is always "but where is the money to come from for these improvements?" and therefore every landlord and tenant should rejoice at an increase of "apron-string" farmers and improvers, seeing that the inflowing of capital and intelligence diminishes rates and increases profits and comforts in a thousand various ways. If I were asked "Why so little town capital finds its way to agricultural improvement?" I should say, 'you have hitherto not held out to it the hand of invitation. Great landed proprietors with poor, unimproved and entailed estates, either from want of knowing that means for their improvement exist, or from a false delicacy as to borrowing the money, or from a disbelief or doubt of the improvements resulting profitably to themselves and their tenantry, have not generally availed themselves to any extent of the two or three existing companies, which have the means and legal powers to effect every necessary amendment, even on strictly entailed estates. I know a great many small land-holders whose property and tenantry would be equally benefited by such investments.

In a national point of view, it would be highly desirable that some hundred millions of our surplus capital should be engaged in producing British food on British soil by British means and labour*, rather than that the cash boxes of our capitalists should be crammed with bonds and responsibilities from every foreign nation and foreign undertaking, to the very casting of Russian cannon to be used against our own troops. I could readily point out how 100 millions could be at once profitably employed in agricultural amendment. But ere this can be done there is an immense amount of prejudice to be removed and self-satisfaction to be disturbed. I, then, venture to predict that in a comparatively short period we shall see every farmery covered in with sufficient shelter for its stock, lighted with gas, its fixed steam engine, economising the costly labour of horses, and warming by its waste steam the various sheds. The food which the farm produces having done its office in the town will run back to restore the fertility which it had exhausted—our land will be drained and irrigated—the residences will be worthy of a more intelligent and more capitalled tenantry, rejoicing in pianos and libraries. The waste and loss occasioned by misplaced buildings, bad roads, and queer-shaped fields, will be corrected by the facile sale or transfer and interchange caused by an easy legal registration.

If we have capital in this country — and who can deny that we have it in superabundance? — let it avail to give to agriculture a higher and more dignified, more intelligent, and consequently a more profitable position. The clumsy appliances and prejudiced neglects of antiquated agricultural customs are not profitable. The men who now suffer most in agriculture are precisely those, whose ill-farmed, wooded, small, and undrained fields, and unimproved buildings, are slowly but surely absorbing the tenant's capital, binding him in poverty and discontent. It will be a happy day for the tenantry of this country, when their rents are doubled, provided that increase represents a proper interest for necessary improvements. This takes place in our towns and cities—why not in our agriculture?

I do attach much importance to the application of our town sewage to agricultural fructification. It is going on rapidly in various quarters; and I have been delighted to find that my intelligent and calculating friend, Mr. Samuel Brooks, of Manchester, has placed at the disposal of the managing council of that city the munificent sum of 1000*l.* to be expended in prizes, or means to obtain the best mode of applying the sewage of that city to the fructification of the surrounding country. My own experience in this matter, with two miles of pipe on my farm, convinces me that the engineering difficulties are perfectly insignificant, and that a nation which has passed its iron railways through every man's house and property, *nolens volens*, for a useful general purpose, will not be deterred from acting similarly in the great question of feeding the British people. One thing is quite certain, that you must convince landlords and tenants that manure liquefied is better and more available than solid manure; this it will take some time to do; and you must also convince engineers that they do not at all know at present the greediness of soil for manure, for if they did, a recent writer in your Journal would never have made the mistake of over-estimating some 30 times the area that would appropriate the sewage of the metropolis. Our excrement is literally our food, disagreeable and disgusting in form and smell, but unaltered in elementary value. Injurious to man it is vitality to plants; and much of the luxuriant vegetables that grace our table are a mere re-embodiment of our own excretæ. The time is gone by for false delicacy in these matters—we must entertain this great privy question. The Chinese would be starved did they follow our example; but that wise people economise with rigid care that which they alone depend upon for the reproduction of their food. I am informed they do not, as we do, fat cattle at a loss with purchased food to produce manure for the growth of corn.

In order to learn the extent to which our food might be increased by the application of town sewage, let us consider that 300 sheep on a farm of 100 acres would keep it in a high state of fertility, and that therefore, reckoning 450 men, women, and children as equivalent to 300 sheep, our population would fertilise 500,000 additional acres. I say nothing of dogs, cats, parrots, canary birds, and horses; they consume largely, each horse consuming the food of eight men. Then you have enormous supplies of waste blood and offal, and a thousand other things that should add millions of quarters to your food. The mere disintegration of your alkaline granites by the abrasion and triturition of traffic—the carbon, or smuts from your roofs, which is but too perceptible after a shower, are all sources of fertility. Amongst the coming improvements in agriculture is—

Cultivation by Steam.—On public grounds, I expended some money in the construction of Mr. Romaine's machine. Our trials with it were only partially successful; we had too much velocity, and too little steam. The act of raising the soil must evidently be by a slow steady motion. Enough, however, was shown to prove that cultivation by steam will soon be the order of the day; several parties are engaged upon it, and I have a strong impression that Mr. Usher's, of Edinburgh, will not be one of the least successful. I find there is one at work in Germany, of which a drawing lies on the table for your inspection. I think Mr. Romaine's has an advantage by the attachment of horse-power in the case of undulating surfaces; but I need hardly tell you, that it requires an immensity of time and no small investment of capital to bring new inventions to perfection. The Royal Agricultural Society of England have very properly offered a premium of 200*l.*, which will no doubt develope many attempts. When we consider that the farm horses consume the produce of nearly one-fourth of the arable land of the country, and when we calculate for how few hours daily they can be kept at work, the whole question is one of great importance to agriculture and to the nation. I hope, now that agricultural statistics are becoming acceptable, that we shall have comprehensive details of the number of acres undrained and otherwise imperfectly farmed, amount of steam power employed, number of acres under lease or annual tenure, customs of valuation to incoming tenant, extent of irrigation, number and position of cottage residences, and other details, necessary to form sound conclusions as to the present condition of British agriculture. As there are, no doubt, several in this large and influential meeting who may hereafter desire to enter upon British agriculture, I think it will be useful to lay bare its internal economy in a popular and simple form, unencumbered with tedious details. Farming, although a most agreeable occupation, is notoriously a slow business, attended with small profits. Fortunately it is so, otherwise our towns and cities would be comparatively deserted; yet, how desirable it is, that the surplus profits of trade, commerce, and manufactures should flow into the lap of poorer Ceres, to develope her powers and increase her riches. One thing is quite certain, that if high farming is slow, unimproved farming in ruinous.

There is nothing more difficult than to obtain from farmers a statistical detail of the cost and return of the various branches of their occupation. Comparatively few keep books, nor do they appear to have considered it necessary to investigate details. By-the-bye, I know a great many tradesmen who have much to revise in this respect.

Farming Capital.—I may, perhaps, be permitted to say generally, that to farm 400 acres of land you should have at least 5000*l.*, or 12*l.* per acre; but if you are to carry out subterranean irrigation and all the modern improvements, you will want 6000*l.* to 7000*l.*, irrespective of landlord's improvements for building, drainage, &c. You will then be in a condition to avail yourself of opportunities, to buy when you see anything cheap, and to sell when things are dear. I assume that you have judgment and a thorough knowledge of your business in all its details, for unless by yourself or others acting for you the most is made of everything, you must expect to lose your capital. There always are in every market men of extraordinary powers, ready to absorb the injudicious or uninformed. Look at my own live stock account; if five per cent. mistake were made in buying and selling it would derange my balance sheet to the extent of 250*l.*

Farm Profits.—As a general rule, 10 per cent. on the capital invested is considered a very good profit in farming. There are thousands who do not realise half of it. Here and there a man of extraordinary powers and great personal economy accumulates a large fortune, but it is the exception, not the rule. A return of four rents per acre is generally considered satisfactory; the average of the kingdom is, I think, less. In cases of improved farms it is sometimes five rents, or more. The necessity for diminishing the fixed expense by an increased produce is illustrated by the statement of a first-rate north-country farmer, who says that, if he spends 1*l.* per acre, or 600*l.* a year for artificial manure he makes a profit; if he omits it he makes a loss. If stock is too dear, or you are short of capital, plough in green and root crops, particularly on heavy land.

Disposal of Capital.—As a general rule, your capital will be absorbed as follows:—

Valuation	£2 10 0	
Live stock	2 0 0	to £6
Implements	1 0 0	
Labour	1 15 0	to £2 5*s.*
Seed	0 10 0	
Tradesmen's bills	0 5 0	
Rent	1 10 0	
Poor rates, tithes, &c.	0 10 0	
Artificial manure...	1 0 0	
Farm horses	1 0 0	
Personal expenditure		
	£12 0 0	

Farmers have generally the advantage of house-rent free, although too many of our farmeries are entirely unfit for a tenant of capital and intelligence, who will seldom enter upon such occupations. Supposing we take a farm of 400 acres on the four-course or mixed husbandry system, we shall find that one-half the farm produces nothing in the way of profit, but on the contrary leaves a considerable charge against, or upon the remaining half which is in corn. For instance the horses consume one quarter of the farm, the sheep and cattle consume the other quarter; and you will find, if you give your live stock much oil-cake or corn, that the whole of the expenses of one half the farm have to be paid by the other half, which is in corn—and whether that corn is at 40*s.* or 80*s.* per quarter, makes a very serious difference to the occupier:—

Example.—400 acres (manure, fences, buildings, roads, and waste, for which the tenant always pays rent) really 380 acres.

50	acres in Clover
30	acres in Beans
20	acres in pasture
40	acres in Tares, Rye-grass, &c.
50	acres in roots
100	acres in Wheat
90	acres in Barley and Oats
380	

It follows then that your 190 acres of corn have to pay two rents, two tithes, two rates, two manual labours, two seedings, two tradesmen's bills, and merely make a polite bow to the other half of the farm for the manure left, by the consumption of its crops. Now, it seems very ungracious that when you have grown a splendid crop of Turnips, at an expense of 7*l.* to 10*l.* the acre, the sheep are to consume it, leaving you nothing but the price of the hay and cake you gave them with it; but it is a system that can't be avoided, until you find some cheaper sources of manure. The man who does not feed off his green crops, but attempts to steal extra crops of corn, soon impoverishes the land and himself too. All our most successful farmers are large purchasers of cake and artificial manure. But if manure is so costly to produce, how important is it that not one drop or atom of it should be wasted! or allowed to run down the ditches or road-sides with every shower. Amongst the evidences of enlightenment and improvement of the present day is the introduction of covered homesteads or farm-yards, where the animals and manure are both sheltered from adverse weather. This is one of the paying moves in agriculture.

But to return to live stock, a reference to my balance-sheet will confirm what I have stated. After paying for purchased food, shelter, and attendance, the sheep and bullocks left a mere nothing for the cost of producing some 70 acres of fine roots and green crops. Owing to my system of managing live stock, I never have disease; but when I find insurance companies charging 20 per cent. for insuring animals! it is evidence of ruinous mismanagement, and would form a charge on my farm of 200*l.* per annum. In pastoral and dairy cheese districts where a suitable soil and climate combine to produce a natural fertility, live stock may be reared, or sustained with advantage on the natural produce, and I believe in parts of Scotland the Turnip is produced more cheaply and nutritively than elsewhere, owing to the climate, but my remarks will apply to a great portion of this kingdom, especially where the rain-fall is under 26 inches, and the climate dry and suitable for the cereals—as on the Eastern and South-Eastern coast. In such districts the retention of poor worthless pastures is a great mistake, and they should give way to a mixed husbandry. On the subject of live stock, I once asked a Lancashire farmer who consumed 500*l.* worth of cake annually, how he charged it. "Oh!" said he, "I charge half to the bullocks, and half to the manure." As a general rule, when we are buying sheep for fattening, we pay 1*d.* per lb. more for them than we could realize for the same weight when fat. This is the penalty we have to pay to the breeder, who has to provide the bone and offal in the animal. Breeding is not all profit, for it robs the corn side of the farm, unless much purchased food and manure is used to restore the balance: but to return to my 400 acre farm. Now I have no doubt this statement will startle many a practical farmer, and will raise a storm of indignation amongst stock feeders and stock breeders; but the naked truth is best told, which is "that live stock are necessary evils, mere manufacturers of manure, and unattended with any direct profit." That if you give them cake and hay whilst feeding off your Turnips and green crops, the return for these green and root crops will be "nil," and their cost must be charged to the corn crops against the manure.

I am firm in this opinion, not only from my own extensive feeding, but from an extended observation, as well as by the undeniable proofs recorded by Mr. Lawes in the "Royal Agricultural Society's Journal." It is a want of this knowledge or belief that leads to so much vexation and disappointment. I remember receiving an inquiry from a novice on farming how much the bullocks should leave for his roots and hay. I told him if he gave them much cake, he would get nothing for his roots, and about two-thirds the marked value of his hay. He evidently was not prepared for this, and suspected foul play. He has since retired from farming in disgust. Another correspondent wrote to state he was about to prepare for the accommodation and feeding a large number of pigs, as a matter of profit. I told him the only profit he would get would be the manure, which would cost him a loss of 10 to 20 per cent., including attendance, casualties, &c. Of course, he thanked me, and gave up all idea of making a fortune by pig-feeding. The same remark applies with increased force to poultry, which should only be in sufficient number to consume the waste corn. Now there is nothing loses so little as a pig, because he makes a quick return; and you get paid meat-price for his skin, which is not the case with other animals; his offal is also valuable. I find, with a very extensive practice, that with fine heavy Barley at 30*s.* per quarter, and pork at 6*d.* per lb. net, pigs will "clear their teeth," or pay for their food, leaving attendance, housing, and casualties, as a charge against the manure. This agrees with the Suffolk saying, that a bushel of Barley, 56 lbs., will make a stone of pork (8 lbs.) For fattening pigs, nothing beats one-third Pea-meal, two-thirds Barley-

* By companies, or by an improved law of partnership.

meal, and some milk, if you have a dairy. I am particular in enlarging and insisting on this important question in agriculture, because there is much mistaken opinion about it; and even the editor of the best Scotch agricultural periodical ("The North British Agriculturist") will continue to assert that live stock will pay, irrespective of manure.

AGRICULTURAL VICISSITUDES.—Three years ago, when I had the honour of addressing you, Wheat was at 38*s.* per quarter, and agriculture gloomy and desponding. Now Wheat is 78*s.* per quarter, with an abundant harvest, and agriculturists happy. Those who will refer to my predictions at that period will admit that I was a true prophet. I will not detain this great meeting with details, but will refer you to "Norfolk Agriculture," by Bacon, a most valuable book, where you will see many honest farming balance-sheets exhibiting all the phases of agricultural prosperity and adversity. You will there see (pages 99 and 100) a difference of 1000*l.* between a "good year" and a "bad one.' It is precisely these strange agricultural vicissitudes that should teach us wisdom. They always have occurred, and they always will occur. A wise agriculturist will, therefore, when things are palmy, put by a little to meet future difficulties, and not invest his happy balance in enlarged holdings, which may hereafter be a dead weight and loss in times of difficulty. On a farm of 400 acres of highly farmed arable land, the discrepancy in price between the two periods would be enormous. Take the 200 acres in grain, the difference would be something like 1500*l.* If I were to advise you, I would say never take a farm that is not thoroughly drained, more particularly if of heavy clay; the alternative is one of profit or ruin. I know so many estates where I see the tenant's capital wasting away under the evil influence of undrained clay, that it is quite a painful consideration. I am prepared to prove that if a tenant will pay his landlord 5*s.* per acre extra, or 5 per cent. on 5*l.* per acre drainage, the gain will, in various ways, far exceed the charge. I may be asked—why I attach so much importance to drainage? Why, you might as well ask me, why I attach importance to circulation, vital or monetary? Stagnated water, or stagnated air, are as ruinous to the plants as they would be to our own vitality. Fix a cork in the drainage hole of your flower-pot, and you will soon have a practical illustration of my meaning. The sallow and bilious plants (like many Turnip crops I know of on undrained land) will show by their expression what is denied to them in speech. This is not the occasion to enter into a subterranean examination of gravity, capillarity, aëration, or filtration, much less of all those affectionate or repulsive interchanges, that turn air, water, and earth, into food for man or beast; but be assured, circulation is vitality—stagnation death and ruin.

AGRICULTURAL POWER.—I lay down as a great axiom in agriculture, in the mere question of physical labour or power, independent of skill, that steam is cheaper than horse, and horse cheaper than man. A steam-horse costs 1*s.* 6*d.* per day, and will do as much work as two real horses. A real horse costs 2*s.* per day (including harness, shoeing, &c.), and a farm labourer, nearly the same. But as a good horse weighs 1600 lbs. and a man only 160 lbs. the power being as from eight or ten to one in favour of the horse, it follows that horse-power is considerably the cheaper, probably (including the necessity for manual superintendence) as four to one. This brings me to the fearful question—what portion of the acreage of this kingdom do farm horses consume? I answer, nearly one-fourth of all the arable land in the kingdom. In ordinary arable culture, where there is little permanent Grass, it requires four farm horses to 100 acres. Each of these horses will consume on the average from 5 to 6 acres (landlord's measure, which includes hedges, roads, waste, farm buildings, &c.) Forty-two weeks, 84 bushels of Oats; 157 trusses of hay, or 7¾ cwt.; 10 summer weeks (no corn) will clear 2½ acres of Clover. This will be found to amount to 10*s.* per week, or 26*l.* per annum, and will be the produce of about 6 acres at 4*l.* 10*s.*, or four rents per acre. I speak, of course, of average land, rented at 20*s.* to 22*s.* 6*d.* per acre, ordinary farming. Many farmers give Oats all the year round. On very poor farming, like some I know of, 10 acres would hardly keep a horse, whilst on very high farming (especially on the irrigation system), one to two acres would suffice. This brings us to consider the imperious necessity and advantage of forcing from the land its utmost possible development. If one acre will keep a horse, there is only one rent, one tithe, one rate, one seeding, and so on; but all these are multiplied from five to ten times, by middling and bad farming. Those who have watched the discrepant productions of three tons or 50 tons of green food per acre, can at once apply my observations. But a great economy may be effected in horse-keep, by crushing the Oats, cutting the green food, and mixing with it a proper proportion of straw, &c., instead of turning the horses out to trample down and defile their food.

Dr. *Cr.*

To valuation, 31st October, 1853.				By Valuation, 31st October, 1854—	
Horses	£74 0 0			Horses	£140 0 0

Cr. LIVE STOCK ACCOUNT. *Dr.*

To Valuation, 1853	£1016 16 0	By Valuation, 1854	£1016 6 0
Corn, cake, and feeding stuffs bought	1021 10 9	Live stock and wool sold	2576 19 5
Live stock bought (including 2 horses)	1619 0 6	Loss, independent of the root and green crops consumed	64 11 10
	£3657 7 3		£3657 7 3

The quantity of green food consumed by the stock is estimated as follows (this includes the keep of six farm horses):—
12 Acres of Mangold Wurzel.
6 Acres of Italian Rye-grass, well irrigated, and five times cut or fed (a very heavy crop).
A good second growth of Clover, irrigated, about 9 acres. A first growth on 8 acres.
20 Acres of Tares and winter Oats.
16 Acres of good white Turnips and Swedes.
The straw of the farm.
5 Acres of pasture.
Grinding meal, attendance, interest for shelter, &c., may be considered as a set off against the horse-keep.

Mr. Mechi's paper was followed by an animated discussion, of which we shall next week give a report. Mr. Sidney defended British agriculturists as being fully alive to the demands made upon them by consumers, and as having progressed as rapidly as any other class of manufacturers. His speech gave a remarkably able history and general description of the agriculture of the country. He contended that steam cultivators were as yet not within the reach of agricultural discussion: and that sewage manure and the liquid system generally were not inapplicable to farming. Mr. Oakley referred to his experience on box-feeding as superior to all other systems for the quality of the manure produced.—Another speaker gave a very interesting experience on the application of liquid manure to Italian Rye-grass. Mr. Caird contended that many of Mr. Sidney's instances of agricultural energy and progress were as exceptional as the case of Mr. Mechi himself, the particulars of which Mr. Sidney had condemned. He stated that Mr. Morton referred to the economy of horse labour, and the profitableness of cattle feeding, as points on which Mr. Mechi's views were open to criticism. Colonel Challoner and Mr. Hoskyns wound up the discussion with remarks in acknowledgment of Mr. Mechi's services. The latter gentleman referred to the solid form as being, in our climate, practically the most useful form in which to apply manure; and, on another point which had been mooted, he acknowledged the practical difficulties in the way of steam power as to its application to cultivation. The chairman spoke of solid and liquid manure, and stated his opinion, that the latter was especially, if not exclusively, adapted for the Grasses and pasture.

Farmers' Clubs.

LONDON, *Dec.* 5.—*On Land Drainage.*—Mr. Bailey Denton read a most substantial valuable paper on this subject—the best practical treatise and discussion of land drainage which we have yet seen or heard. It is to be published in a separate form, and we are therefore permitted to lay only an abstract of it before our readers, though to some of the points treated by its author we shall hereafter direct their attention. The paper commences with a comparison of Smith of Deanston's system and of Mr. Parkes's:—

"The characteristic views of Mr. Smith were—

"1st. *Frequent* drains at close intervals of from 10 to 24 feet. 2d. *Shallow* depth—not exceeding 30 inches—designed for the single purpose of freeing the depth of soil of stagnant and injurious water. 3d. '*Parallel drains at regular distances*, carried throughout the whole field, without reference to the wet and dry appearance of portions of the field,' in order 'to provide frequent opportunities for the water *rising from* below and falling on the surface to pass freely and completely off.' 4th. The minor drains to be directed 'down the steep,' and the mains to be directed along the bottom of the chief hollow, with tributary mains for the lesser hollows. (The reason assigned for the minor drains following the line of steepest descent was, that 'the stratification generally lies in sheets at an angle to the surface.'*) 5th. Stones preferred to tiles and pipes.'

"The characteristic views of Parkes, then, were—

"1st. *Less frequent drains*, at intervals varying from 21 to 50 feet, *with preference for wide intervals*. 2d. *Deeper drains at a minimum depth of 4 feet*, designed with the twofold object of not only freeing the active soil of stagnant and injurious water, but of converting the water falling on the surface into an agent for fertilising; no drainage being deemed efficient that did not remove both the water falling on the surface and 'keep down the subterranean water at a depth exceeding the power of capillary attraction to elevate it too near the surface.' 3d. *Parallel arrangement of drains*, as advocated by Smith of Deanston. 4th. *The advantage of increased depth put forth as compensating for any disadvantages attending increased width* between the drains. 5th. *Pipes of an inch bore the 'best-known conduit'* for the parallel drains. (See Evidence before Lords' Committee on Entailed Estates, 1845, Q. 67.) 6th. *The cost of draining uniform clays should not exceed 3l. per acre.* (See Evidence before Lords' Committee, 1845, Q. 151 and 152.)"

On this Mr. Denton remarked that, "Mr. Smith's or the shallow system, aiming only at getting rid of the enemy, was most popular in the country, because the object was simple, and it approximated more to past practices. Mr. Parkes's, or the deeper system, on the contrary, aimed at the conversion of the enemy into a friend." The main criticism Mr. Denton makes on Mr. Parkes's system is on the score of the excessive cheapness recommended. "In the desire for economy, soils that should have been drained from 18 to 25 feet apart have been drained at from 30 to 45 feet, and yet the average actual cost of parallel drainage, executed in Great Britain within the last eight years, will be found to be at least three times the cost instanced by Mr. Parkes, and which he gave, in 1846, as that which might be taken as a guide to the future cost of drainage in this country." Mr. Denton then goes into the subject generally, and the points discussed "are four in number, and may thus be taken—*Depth of drains, distance between drains, arrangement of system*, and *direction of drains*." On the first he states—

"The character of the evidence I have collected is so condemnatory of the shallow system of drainage, and, with one exception only, so much in favour of the deep system, that I consider the superiority of the latter incontestibly admitted. In fact, I have failed altogether to gain evidence detracting from the utility of deep draining as compared with shallow, although prompted in my inquiries by an honest and earnest anxiety to promote discussion on the comparative advantages of the two systems. Cases without number may be quoted in which an indiscreet desire to economise has led to the recognition of the theory that depth will compensate for distance in soils to which it would not apply. But these instances, though they prove that drainage is not so cheap an operation as was supposed, do not affect the abstract question of the superior efficacy of deep drains compared with shallow ones. We have abundant instances of deep drains taking the place of shallow ones, and effectively draining land not hitherto drained, although excoriated with shallow drains; while it is difficult, if not impossible, to name a single case where deep drainage properly executed, and on a good system of arrangement, has failed. So numerous, indeed, are the instances throughout Great Britain of the complete success of deep draining as a principle, that one can hardly bring one's mind to the expediency of a compromise of that principle under any circumstances whatever."

An immense body of evidence is referred to on this subject, and he sums up thus:—

"I submit that upon the first point, *depth*, the results of the practice of the last few years have confirmed the soundness of the principle of a minimum depth of four feet, where outfalls will admit of it."

On the next point, *distance between drains*, the relations of climate to soil—*i. e.* the composition of clays, and the quantity and distribution of the rain-fall—which are the two elements to the decision of this point, are both of them very usefully discussed, and he sums up thus:—

"I submit upon the second point, *distance between drains*, that the results of the practice of the last few years have confirmed the principle, that depth may govern distance in soils of an uniformly open and porous nature; that in the denser clay soils the compensating principle is inadmissible, and that much clay land has been drained imperfectly from being drained too widely. And that in lands suffering from springs, or from a pressure of water, where each drain should be designed for a special service, there is no dependence of one drain upon another, and therefore no rule of distance whatever can apply."

As to *arrangement of drains*, Mr. Denton concludes that if—

"We are to profit by experience, we shall be led to modify the parallel system of arrangement by a closer attention to the variation in the texture of the soil, and in the inclination of the surface. We shall look more to a subdivision of fields, which are now too frequently prejudiced by a love of mathematical uniformity; we shall cease to continue the drains of low flat-lands, up the face of steep hilly ground for the sake of straight lines; we shall look upon all continuous hollows, and lateral valleys, as nature's drains, which cannot be overridden by even the closest parallelism, but must be retained as the proper course of drainage, though the conduit be in future below, as it has hitherto been above the surface; and we shall for the same reason apply distinct relief drains to those slacks or planes of lesser inclination, which constantly interpose in fields apparently of one slope and aspect, and which, when drained on one uniform plan, never fail to exhibit tell-tale spots which are not unlike a black eye on a healthy schoolboy's face: the mark of both being signs of weakness."

The fourth point is *direction of drains*, and on this he concludes as follows:—

"The results of the practice of the last few years have confirmed the principle of laying out the minor drains with the fall of the ground in the generality of circumstances—that the principle of carrying the drains across ridge and furrow may be departed from in certain soils without disparaging effect—and that, let the direction of the drains be what they may, a constant and effective discharge can only be secured and maintained in perpetuity by carefully designing, and by substantially securing the outlets with due regard to arterial channels."

Several minor systems of drainage were then discussed—among others Lord Wharncliffe's combined deep and shallow, which is condemned; and Mr. Trimmer's Keythorpe system, which makes use of the natural furrows in the subsoil as carriers of water, which is also condemned as to its practical carrying out, though it is admitted that the knowledge of the distribution of surface soils over uneven, scored, and channelled subsoils will be useful. Mr. Denton then discusses spring drainage, syphon drainage, &c., matters of local rather than general interest, and to which, therefore, we shall not here refer. His concluding paragraphs are on drainage legislation; he enumerates all the various powers conferred by law, whether on departments of the executive or on companies for the purposes of agricultural improvement. We shall at another time go fully

* "There is no doubt that all stratification that is not parallel with, but outcrops at the surface, must describe an angle with it; but Mr. Smith was wrong in asserting that the soils operated upon by drainage 'generally lie in sheets.' Lamination of soil is found to be the exception, not the rule."

into this point, enumerating the powers of all the different companies; but we must not, at present, extract so largely from the pamphlet which Mr. Denton is to publish. We conclude with his statement of the expenditure of the 4,000,000*l.* at the disposal of the commissioners under the Public Drainage Acts. The amount already spent is 2,239,157*l.* 12*s.* 10*d.*; the amount bespoken is 3,951,150*l.*, which has been applied for as follows:—

England,	957	applicants for	£1,706,594
Wales	53	„ „	107,199
Scotland	892	„ „	2,137,367
Total	...	...	£3,951,150

There is thus little left for further applicants.

Mr. Denton's paper was received with great satisfaction by the large and influential body before whom it was read; and an interesting discussion followed, of which, however, we cannot now lay any report before our readers. Mr. Cuthbert Johnson referred to the uses of drainage water for purposes of irrigation. Mr. Baker, of Writtle, discussed the policy of tenants-at-will, and advocated the cheapest possible efficient system, as being the one which was proper in their circumstances. Mr. Bullock Webster, with great influence on the meeting and evidently commanding the sympathies of the majority present, condemned the practice of going deeper than 3 feet in stiff clay subsoils not surcharged with water. Mr. Thomas, of Bedfordshire, discussed Mr. Mechi's agricultural experience in drainage. Mr. Walton referred with great humour and force to his own experience. Mr. Stokes contended for the general efficacy of 4 feet drains. Mr. Mechi referred to the depths to which roots would go, as properly guiding a decision on the depth of drains. Mr. Bailey Denton replied. The discussion was a most animated and interesting one, and we hope to give an abridgement of it in our next.

Miscellaneous.

Crops of Swedes in 1853.—Prizes of silver medals, 5*l.*, 4*l.*, and 2*l.* are given by the Manchester Agricultural Society in the following instances:—1. T. J. L. Brooke, Esq., Mere Old Hall, near Knutsford. Claimant's farm is 125 acres. Extent in Turnips, 5 acres. Previous crop, Oats. The soil is a deep friable loam, upon a clay and sandy subsoil, well drained. The seed, 2½ lbs. per acre, was sown in drills, on the 16th May, and 14 tons of farm-yard manure, 5 cwt. of raw bones, and 1½ cwt. of guano, was applied per acre. The cultivation was very clean, and the bulbs large and handsome, but some of them were unsound. Two statute perches were weighed, which gave an average of 33 tons per acre. 2. Mr. J. Birch, Orrell, near Liverpool. This claimant's farm contains 121 acres, of which 8 acres were in Swedish Turnips. The previous crop had been Wheat after Potatoes. The soil is a sandy loam, on a subsoil of sand, clay, and foxbench. The drills were 25 inches apart, and the bulbs 12 inches. Two lbs. of seed were sown per acre, on the first week in May. Twenty-five tons of stable manure and nightsoil, mixed together, and 2½ cwt. of guano, were applied per acre. The land was very clean, the crop remarkably uniform, and the bulbs large and sound. Average weight, 42 tons 8 cwt. 2 qrs. 8 lbs. per acre. Weighed 10th November, 1853. 3. To Mr. T. Atherton, Speke, near Liverpool. This claimant's farms contain 146 acres, and he had five in Swedes. The land had been Grass, cut for hay the previous year. Average weight 48 tons 12 cwt. 3 qrs. 2 lbs, per acre. Mr. Atherton obtained a prize for common Turnips. The land had been mown the previous year (three years old Grass). The soil was a good deep, sandy loam, on sand and gravel, and properly drained. The land was planted with early Potatoes last spring, in rows 27 inches apart. 2 lbs. of Turnip seed per acre was sown in the intervals between each row of Potatoes, in the month of June. In taking up the Potato crop, care was taken not to cover the young Turnip plants. Twenty-five tons per acre of night-soil was applied to the land, and ploughed in in the autumn of 1852, and 25 tons per acre of cowdung in the spring, when the Potatoes were planted, and also 3 cwt. of guano per acre to the Turnip crop. The land was very clean, the bulbs sound, well grown, and of good shape. Average weight of crop, 20 tons 16 cwt. 1 qr. 20 lbs. Weighed November 15, 1853. *Journal of Manchester and Liverpool Agricultural Society*, 1854.

Notices to Correspondents.

Flax: *J Bell.* We know of no joint stock company for purchasing Flax straw. A Flax rettery cannot draw profitably beyond a radius of 15 or 20 miles around it.

Grass Land: *Weekly Reader.* If exhausted by continual mowing, you may get it up again soon by pasturing sheep and giving them food on the land. 3 cwt. of guano, in compost with a lot of ditch mould (if you can get that free of weeds), will set the land up at once. Italian Rye-grass may be sown in August on fresh-stirred stubble; but is best sown in April.

Mangold Wurzel: *Constant Sub.* You may commence feeding on them now, giving more dry food in addition to them than you would with Turnips.—We do not know the natural history of the badger, but will inquire.

Nitrate of Soda and Salt: *Young Farmer.* The common salt would have been better mixed with the guano. It is to be thrown broadcast over the field, and harrowed in during March or April. If it be sown in wet weather, it will not injure the Clover seeds.

Philipps' Turnip Cutter: *W. D.* We do not know their present address; they have left Bristol, we believe.

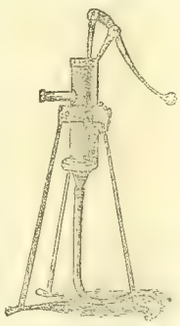
Stables: *Old Sub.* It is better for the horses that they be well ventilated, and that is easier done when there are no lofts.

Wheat: *J S C.* Any kind of Wheat (not the April) will do to sow now. We should try and get Bristol red or Redstraw white; sow 6 pecks an acre if in the south of England. Gas-lime becomes gypsum and common lime by exposure to air. You may put a ton per acre on the ground, spread broadcast on the stubbles before ploughing in. You must not dress young Wheat with it.

WEIR'S DRAINING LEVEL.
Price 30*s.*

These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.

Edward Weir, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.



WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

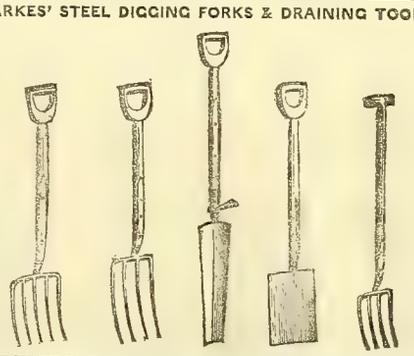
Diameter of Barrel, under nose.	Length of Barrel,		£ *s.* *d.*
2¼ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12 0
2¼ „	long 3 „ 3 „		1 15 0
3 „	ditto 3 „ 6 „		2 12 0
3¼ „	ditto 3 „ 6 „		2 18 0
4 „	ditto 3 „ 6 „		3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2¼ in.	long ditto	ditto ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER and SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

GLASS FOR CONSERVATORIES, ETC.

HETLEY and CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

6 in. by 4 in. to 6 in. by 5½ in.	... 13*s.* 3*d.*	per 100 feet.
7 by 5 to 8 by 6	... 13 6	
8½ by 6½ to 10 by 8 ...	... 14 0	
10½ by 8½ to 14½ by 10½ ...	... 16 0	
17 by 10 to 18 by 12	... 18 0	

A great variety of sizes. Particulars had on application.

ORCHARD HOUSE SQUARES on Mr. Rivers's plan, to whom I have sold some thousands of feet.

Large Sheets for cutting up, in cases, at 2½*d.* and 3*d.* per foot.

HARTLEY'S IMPROVED ROUGH PLATE GLASS, Sheet, and Rough Plate, Tiles, Milk Pans, Bee and Propagating Glasses, Wasp Traps, Cucumber Tubes, Preserve Jars, with and without covers; Fern Glasses.

Plate, Sheet, Crown, and Ornamental Window Glass. Crystal Glass Shades for ornaments.

Greenhouses, erected in either wood or iron. Garden Lights and Frames.

87, Bishopsgate Street Without, London—same side as Eastern Counties Railway.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

Packed in Boxes of 50 feet each.

6 by 4 and 6½ by 4½	10*s.* 6*d.* per box.
7 „ 5 „ 7½ „ 5½	12 0 „
8 „ 6 „ 8½ „ 6½	13 6 „
9 „ 7 „ 9½ „ 7½ and 10 by 8 ...	15 0 „

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2*s.* each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,
116, Bishopsgate Street Without.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, 296, Oxford Street, London.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt.

HARTLEY'S PATENT ROUGH PLATE, for Roofing Conservatories, Halls, and Public Buildings.

PLATE, CROWN, and SHEET WINDOW GLASS.

Coloured and Ornamental Glass of every description.

Glass Milk Pans, Pails, Tests, and Measures; Cream Pots and Syphons; Churns, Butter Tests and Slabs; Tiles and Slates; Bee Hives, &c.

Moore's Patent Ventilator and Lockhead's Patent Perforated Glass, for Dairies and Greenhouses.

Aquavivariums, Fern Shades, Propagating Glasses, Fruit Protectors, Preserve Jars, Cucumber Tubes, Hand Lights, Flower Vases, Labels, &c., and all kinds of Agricultural, Horticultural, Architectural, Domestic, Scientific, and Ornamental Glass, British and Foreign, at the lowest prices.

CLAYTON, SHUTTLEWORTH, and CO.'S PRIZE PORTABLE STEAM-ENGINES, and COMBINED THRASHING, STRAW SHAKING, RIDDLING, and WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as thrashed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. and Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading agricultural shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

B. SAMUELSON (Late James Gardner),
BRITANNIA WORKS, BANBURY,
and at
IMPLEMENT STANDS, 57, 58, 59, 60, 61, 62, and 63, SMITHFIELD CATTLE SHOW.

SAMUELSON'S PATENT FORKING AND DIGGING MACHINE
Has been awarded the Royal Agricultural and numerous County Prizes.

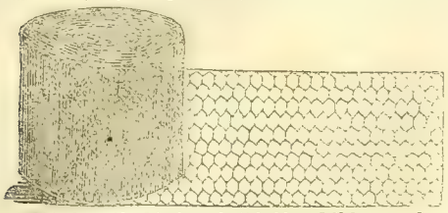
SAMUELSON'S GARDNER'S TURNIP CUTTERS,
With new PATENT DIRT RASPING PLATE, received the First Prize of the Royal Agricultural Society at Lincoln, and at all the Royal Agricultural Society's Shows from 1844.

Economical Chaff Cutters
Corn Bruising Mills
Oilcake Breakers
McCormick's Reaping Machines
Registered Budding's Lawn Mowers
Patent American and Atmospheric Churns
Patent Force Pumps for Farm Use
Field Rollers, &c. &c. &c.

Illustrated Catalogues and other particulars may be had of any Ironmonger or respectable Implement Dealer in town or country; at Stands 57 to 63, Smithfield Cattle Show, or free by post of

B. SAMUELSON, Britannia Works (late Gardner's), Banbury.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½d., 6d., and 8½d. per yard.
24 inches wide, 2-inch mesh, 7d., 9½d., and 1s. per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

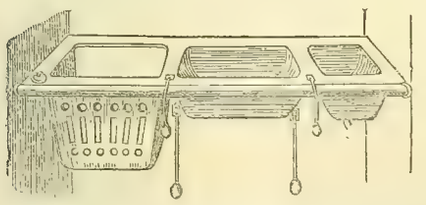
GALVANISED WIRE GAME NETTING.—7d. PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7d. per yd.	5d. per yd.
2-inch „ strong „ ...	9 „	6½ „
2-inch „ extra strong „ ...	12 „	9 „
1⅝-inch „ light „ ...	8 „	6 „
1⅝-inch „ strong „ ...	10 „	8 „
1⅝-inch „ extra strong „ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.
Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

THE MOST APPROVED STOVES.—The demand for the CHUNK and VESTA STOVES (separately patented), still continuing unabated, and numbers having been sold last season (in all upwards of 14,000) through the patronage of families who have had experience of their pre-eminently useful qualities, WILLIAM S. BURTON has renewed confidence in recommending them for their cleanliness, economy, and safety. During the last 13 years they have been found sources of great comfort in the bedroom of the invalid, affording an uniform temperature throughout the day and night, with one supply of fuel, without attention. Particulars sent postage free. Chunk, 30s. to 50s.; Vesta, from 35s.; Stoves for Warehouses, &c., from 10s. each. Joyce's Patent Fuel, 4s. 6d. per sealed bag.
WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.
Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.
39, OXFORD STREET (corner of Newman Street); Nos. 1, & 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

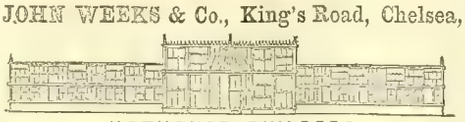


THE only Patented invention of this description constructed so as to prevent considerable waste of Hay and Corn, together with all the newest improvements.
STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.
Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 35s. each. Price Lists and Illustrated Catalogues forwarded on receipt of two postage stamps.
JAMES BARTON, IRON FOUNDER, &c., 370, Oxford Street, a few doors east of the Pantheon.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1l.—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1l. Hermetically-sealed Inodorous Chamber Commodes, 1l., 2l. 4s., and 3l.; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square.

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge.
ESTABLISHED A.D. 1700.

TEN THOUSAND STOVES.
THE TENTH THOUSAND OF THE PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, AND CO., 46, King William Street, London Bridge; and may be obtained of most Ironmongers.
The IMPROVED PATENT VENTILATING STOVE, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded post free.

FORD'S EUREKA COLOURED SHIRTING is now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.
FORD'S COLOURED EUREKA SHIRTS, Six for 27s.
FORD'S WHITE EUREKAS, best quality, Six for 40s.; second quality, Six for 31s.; if washed ready for use, 2s. extra.
CAUTION.—Ford's Eureka Shirts are stamped, "38, POULTRY, LONDON," without which none are genuine.
*** Catalogues with particulars post free.
RICHARD FORD, 38, Poultry, London.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS!—DR. BARKER continues to supply the afflicted with his celebrated remedy for this complaint, the great success of which for 16 years past renders further comment unnecessary. It is easy and painless in use, causing no inconvenience or confinement, and is applicable to every variety of single or double ruptures, however bad or long standing, in either sex, of any age. The remedy will be sent post free to any part of the world, with Instructions for use, on receipt of 7s. 6d. in postage stamps, or post-office order (preferred), payable at the General Post Office, to ALFRED BARKER, M.D., 25, Argyle Square, King's Cross, London. Patients received every morning except Sunday from 11 till 2, and at no other hour, unless by appointment made two days previously. Consultation fee, One Guinea.

TO LOVERS OF FISH.—100 Genuine Yarmouth Bloaters for 6s., package included, forwarded to all parts on receipt of Penny Postage Stamps, or Post Office Order, for the amount preferred.
Address, THOMAS LETTIS, Jun., Fish Curer, Great Yarmouth.

TO HOP MERCHANTS AND IMPORTERS.
WANTED, a COMMISSION in HOPS, for Scotland.—References, &c., on application to C. W. A., *Herald Office*, Glasgow.

ALDERNEY BULL.—A Clergyman has a very fine Bull of the above breed for sale, 14 months old, and very strong and handsome.—Apply to Rev. F. H. L., Merevale, Atherstone.

PURE BRED SOUTH-DOWN EWES.
TO BE SOLD by a gentleman who has a large flock of sound pure bred SOUTH-DOWN SHEEP, will be overstocked at Lady-day, in consequence of giving up one of his Farms. He wishes to sell 100 Ewes, in lamb to tups now on the Farm. The ewes may be selected. Apply to Mr. W. Turner, The Shepherd, Dowdeswell, near Cheltenham, Gloucestershire.

TO NURSERYMEN, SEEDSMEN, AND FLORISTS.
TO BE SOLD, in consequence of the Proprietor retiring from business, a capital BUSINESS in the above line, with a first-rate connection, and of 17 years' standing. The Premises, which are convenient and well situated, will be sold with the Business. Such an opportunity seldom occurs.—For particulars apply to Mr. LENDON, Nurseryman, &c., Wellington, Somerset.

TO BE SOLD, BLACK POLAND FOWLS (Cock and Three Hens). Birds that took the second prize at Derby at the recent Show. Price 2l.—Apply to Mr. PECKHAM, Breadsall Moor, near Derby.

TO BE SOLD, eight couple of WHITE DORKING PULLETS, hatched in March, at Ten Shillings per couple, and one Cock for Six Shillings.—Apply to J. TUTTON, Gardener, Mordon Park, Mordon, Surrey.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

TO FANCIERS OF PIGEONS AND COCHIN CHINA FOWLS.
TO BE SOLD, by a Gentleman, in consequence of his leaving his residence, his entire stock of PIGEONS and COCHIN CHINA FOWLS. The pigeons have been selected from pure birds, and at a very considerable expense. They consist of Owls, Nuns, Jackobines, Almond Tumblers, Horsemen, Fantails (white and black), Barbs, and Archangels. The Cochin China Fowls (cinnamon coloured), are very large and first-class birds. Address, prepaid, A. B., Post-office, Atherstone, Warwickshire.

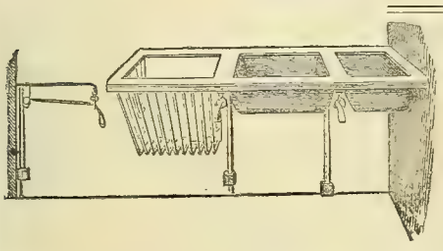
WOOLWICH.
TO GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.
MESSRS. PROTHEROE AND MORRIS are directed by Mr. Williams, who is declining business, to submit to an unreserved Sale by Auction, on the premises, Bowater Nursery, Woolwich, on FRIDAY, December 15th, at 11 o'clock, the whole of the NURSERY STOCK, consisting of Evergreens, Ornamental Trees, and Deciduous Shrubs; also the GREENHOUSE PLANTS, comprising Fine Double Camellias, and Azalea Indica well set with bloom buds, Geraniums, &c.; with several Brick Pits, 2 and 3-Light Boxes, capital Hot-water Pipe, Saddle Boiler, a quantity of Hand and Bell-glasses, two capital Nests of Seed Drawers, Counter, Garden Seeds, Wheelbarrows, and sundry effects.—May be viewed one week prior to the Sale. Catalogues may be had on the Premises, of the principal seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.
MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, December 14th, at 12 o'clock, a first-class collection of DUTCH BULBS, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Anemonies, Crocus, Tulips, Snowdrops, Ranunculuses, Gladiolus, &c.; also a selected assortment of fine Standard and Dwarf ROSES, with fine American Plants, well set with bloom buds, &c. On view the morning of sale.—Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

MITCHAM.
MESSRS. PROTHEROE AND MORRIS are directed by J. W. Dawson to sell by Auction without reserve, on the premises, Mordon Road, Mitcham, Surrey, on MONDAY, Dec. 18, 1854, at 11 o'clock, the NURSERY STOCK, consisting of Evergreens; comprising Chinese Arbor Vitæ, Laurel, Privet, Laurestinus, Hollies, Aucubas, Rhododendrons, Pyracantha, Honeysuckles, Currants, quantity of Rhubarb, Herbs, &c.—May be viewed prior to the Sale.—Catalogues may be had on the premises of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO FLORISTS AND OTHERS.
MESSRS. JONAS AND THOMAS PAXTON are instructed to sell by Auction, on WEDNESDAY, December 20th, at 11 o'clock, the whole of the choice collection of Picotees, Chrysanthemums, &c., of the late Rev. A. H. Mathews, at Weston-on-the-Green, midway between Oxford and Bicester.—Catalogues may be had of the Auctioneers, Bicester, Oxon.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.



COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, as one Fixture, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest.

COTTAM'S ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.

IMPROVED PUMPS,

OF THE BEST WORKMANSHIP AND WARRANTED.

The VALVES and SUCKERS of these Pumps are constructed upon an entirely new and SIMPLE principle; they are not likely to get out of order; should they do so, can easily be repaired, as the Pump is so contrived that the valves can readily be got at.

An Improved CAST IRON TRAP, strongly recommended by the Sanitary Commissioners, and suitable for Sugar Bakers, Slaughter Houses, &c. &c. It is so formed that the Trap-plate will pass any matter the top grating will let through, and therefore is not liable to stoppages; and well adapted to Stables and Stable-yards, for saving the best part of Liquid Manure.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

In One large Volume, 8vo, with upwards of Six Hundred Woodcuts, price 50s. half-bound,

GARDENERS' CHRONICLE for Sale, from 1844 to 1853, inclusive.—Apply by Letter, to E. H., care of Mr. LOW, Stationer, 31, Abchurch Lane, City.

A SUPPLEMENT, GRATIS, WITH THE WEEKLY DISPATCH, EVERY WEEK UNTIL FURTHER NOTICE.—The unexampled interest which attaches to every incident connected with the operations of the Allied Armies in the East has determined the Proprietors of the WEEKLY DISPATCH to devote a greater space to the intelligence from the seat of war than the ordinary limits of this, the largest newspaper published, could possibly afford; and, with the view of giving the amplest details, they have resolved upon the issue of a SERIES OF SUPPLEMENTS, GRATIS, which will include every particular of interest connected with the Siege and decision of the contest at Sebastopol, and will be continued whenever demanded by the progress of the Campaign.
By the publication of these Supplements the portion of the Paper usually devoted to incidents of domestic and political importance will be reserved intact, and the engrossing subject of the War will receive the fullest and most varied illustration.
A SUPPLEMENT WILL BE PUBLISHED ON SUNDAY NEXT (GRATIS), and on every succeeding week until further Notice.—Orders may be given to all Newsvendors in town and country; and to the publisher, at the *Dispatch* Office, 139, Fleet Street, London.

Just out (3d year), 1s.; or bound as a pocket-book, 2s. 6d., post-free, 6d. extra each, stamps equivalent,

THE ANGLER'S ALMANAC; a Hand-book and Guide to the Rivers and Lakes in Great Britain and Ireland. Richly illustrated.
London: GEORGE COX, King Street, Covent Garden. Sold by Booksellers and Tackle Makers.

Illustrated London News.

THE YEAR 1855 bids fair to be one of the most important and eventful of modern history. On the 6th of January, 1855, will be issued the first number of a new volume of the ILLUSTRATED LONDON NEWS, and not merely a new volume, but of a New Year—each volume being perfect and complete in itself—containing, for the time, a faithful record, pictorial and descriptive, of all Events of Interest in every part of the world. To that limited portion of the public who do not subscribe to this Journal it may be stated that no period could be selected more opportune for commencing,—the whole expense being but 26s. per annum, exclusive of double numbers, which are issued on rare occasions, when it would be impossible to crowd the important events and Engravings into a single number; for this small sum the subscriber will receive 24 large pages—72 columns—of the most interesting information, carefully selected from the News of the Week, interspersed with a variety of charming Articles on the chief topics of the day.
The ILLUSTRATED LONDON NEWS has, by its impartial and consistent advocacy of the welfare of the public, secured for itself a political influence scarcely second to any Newspaper in the Empire; and reference can, with some pride, be made to the support afforded to all beneficial measures proposed and adopted by the English Parliament.
Foreign Politics will ever command the attention which ought to be devoted to so important a feature of a Newspaper. On the question of the Russian War, during the year 1854, ONE THOUSAND ENGRAVINGS appeared in the ILLUSTRATED LONDON NEWS. Extensive arrangements, calculated to improve this popular Journal, and engagements such as will greatly enrich its Literary, Scientific, and other departments, have been made, and will thus combine on this Paper the greatest talent of the day.
The ILLUSTRATED LONDON NEWS has been established 13 years, during which period it has received a greater degree of encouragement and approbation than any Journal ever published. This is proved by the Return of Stamps issued from time to time by order of Parliament. The Stamps applied for the first six months of 1854 were upwards of 2,734,000—showing a WEEKLY CIRCULATION OF UPWARDS OF ONE HUNDRED AND THIRTY THOUSAND COPIES!
Terms (for payment in advance)—Half-year, 13s. 6d.; Year, 26s.
Any of the Volumes of the ILLUSTRATED LONDON NEWS, from the commencement to the present time, may now be had, in paper or cloth. Covers for Binding the Volumes 2s. 6d. each.
All Numbers may be sent free by post to any part of the Kingdom and the Colonies.
Give an order for six months to ensure all the gratuitous Prints and Supplements. Supplied by all Booksellers and Newsmen.
The ILLUSTRATED LONDON NEWS is published in London every Saturday, stamped, to go free by post, 6d. per copy.
Office, 198, Strand, London.

BOARD OF TRADE, DEPARTMENT OF SCIENCE AND ART.—AID TO PUBLIC SCHOOLS IN OBTAINING EXAMPLES FOR ART-INSTRUCTION.—The Lords of the Committee of Privy Council for Trade having resolved to furnish examples to Schools in accordance with the plan adopted by the Committee of Privy Council for Education, and to discontinue the practice of keeping a stock of such articles at the Department, NOTICE IS HEREBY GIVEN, that on and after the 1st of January, 1855, Examples will not be supplied directly from the Department of Science and Art as at present, but through Agents in London and the Provinces.
Forms of application for aid, and further information may be obtained at the Offices, Marlborough House, Pall Mall, London.
Marlborough House, 30th November, 1854.

ROYAL PANOPTICON OF SCIENCE AND ART, LEICESTER SQUARE.—Lectures for the ensuing week:—Dr. Noad, on Electricity, with Demonstrations on the Gigantic Electrical Machine in the Rotunda, Monday evening, 8.15. Ansell, Monday; Tuesday, and Friday, 3.15; Thursday, 8.15. Geology, Mr. Hugo Reid, Thursday, 3.15. Principal Attractions at the Present Time. Luminous Fountain daily, at 4.55 and 9.55. Moving Panorama and Dioramic Views of Verona, 2.45 and 7.45. Grand Performance on the Organ, by Mr. W. T. Best, at 4.15. Cosmorama of St. Petersburgh and Moscow, with Portrait of Czar Nicholas. Heinke's Diving Apparatus and the Subaqueous Light in the Crystal Cistern, 2.15 and 7.30. Distin's Flügel Horn Union, 9.15. Doors open in the morning at 12, in the evening (Saturday excepted) at 7. Admission 1s. Schools and children under 10 half price. Season admission 1l. 1s. Life admission 10 guineas.

JOHN MORREN, GENERAL COMMISSION AGENT, Ock Street, Abingdon, is open for Commissions for the sale of Agricultural Implements, Manures, Seeds, &c., and for the purchase of Corn, &c.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.

MAPPLEBECK AND LOWE, MACHINISTS AND MANUFACTURERS, respectfully invite Agriculturists and others who may visit the BIRMINGHAM CATTLE and POULTRY SHOW, in the week commencing December 11, to inspect their very extensive Collection of AGRICULTURAL IMPLEMENTS, in the SMITHFIELD and GLOUCESTER STREET WAREHOUSES; also many Choice WORKS of ART, and every kind of useful Hardware, in their FURNISHING IRONMONGERY SHOW ROOMS, BULL RING. Wholesale and Retail.

MECHI'S PREPARATIONS FOR CHRISTMAS AND NEW YEAR'S PRESENTS.—Sensible that the season is approaching when love and friendship give their tangible testimonials, MECHI has taken care to provide an abundance of objects for tasteful selection. None need deny themselves the luxury of giving, for the most inexpensive, as well as the most costly, articles are to be found at his Repository of Utilities and Elegancies, 4, Leadenhall Street, near the India House. England has always been renowned for its hearty Christmas liberality, while "Le Jour de l'An" of our lively neighbours the French is equally consecrated to the gifts of affection. MECHI invites a visit from the natives of all countries to his Emporium. In his elegant show-rooms are displayed a superb stock of Ladies' and Gentlemen's Dressing-Cases, Work-Boxes, Tea-Trays, Work-Tables, Chess-Tables, Tea-Caddies, Card-Cases, &c. Those who desire to make really useful presents will find in the general department the best Table Cutlery, Scissors, Thimbles, Pen-Knives, Writing-Desks, Ivory and other Hair Brushes and Combs, and a variety of goods adapted to every exigency. Also Bagatelle Tables, affording a charming amusement on a wintry or wet day.—4, Leadenhall Street.

On the 18th December will be published, price 3d., or Stamped 4d.,

The Chair will be taken at 12 o'clock. The Ballot will close at 2 o'clock precisely.

By order of the Committee,
Dec. 8, 1854. E. R. CUTLER, Secretary.
14, Tavistock Row, Covent Garden.

SEED GROWERS' SOCIETY.—The Members of the above Society are now prepared to send LISTS of AGRICULTURAL, GARDEN, and FLOWER SEEDS to those who are desirous of having them genuine and direct from the Growers.—Applications addressed to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex, will meet with prompt attention.

MANGOLD WURZEL SEED.

TO BE SOLD, LONG RED and YELLOW GLOBE, this year's seed, from superior stock.—Apply to R. S. HEWS, Kelvedon, Essex.

CEMETERIES.

MESSRS. MAJOR AND SON having been repeatedly asked whether the laying-out of Cemeteries falls within their province, beg to announce publicly that they consider it does strictly fall within their province as Landscape Gardeners, that they have directed especial attention to it, and have the arrangement of several at the present time, and, therefore, beg respectfully to offer their services to all who are in any way concerned in the formation of Cemeteries.—Knosthorpe, near Leeds.

CEMETERIES.

WILLIAM BARRATT having had considerable experience for more than 20 years in Laying out and Planting Cemetery Grounds, begs to offer his services in that department of LANDSCAPE GARDENING, and also to observe that he has a large Stock of well grown Trees, Weepers, and Shrubs, suitable for such planting.—St. John's Nurseries, Wakefield.

EXOTIC NURSERY, CHELSEA.

JAMES VEITCH, JUN., having engaged in addition to his other able foreman, the assistance of Mr. John Milne, late gardener to Byam Martin, Esq., of Kingston-on-Thames, and before that gardener and steward to the Right Hon. the Earl of Clare, Mount Shannon, Ireland, feels increased confidence in being able to give complete satisfaction to those who may kindly patronize him.

The long and extensive practical experience which he has himself had at Exeter, as well as since he came to Chelsea, combined with Mr. Milne's high standing as a practical gardener, induces him to tender his services to any lady or gentleman requiring advice in the Improvement of their Gardens and Grounds, and in other Horticultural matters, particularly in reference to the erection of Conservatories, Forcing and Plant Houses, Heating Apparatus, &c., plans for which will be furnished on application, and examples can be seen both at the Exotic Nursery, Chelsea, and at Exeter.

JAMES VEITCH, Jun., is fully impressed with the fact that to make Horticultural Buildings what they really should be, thorough practical Gardening experience is required to adapt the various erections to the several purposes for which they are intended. This desirable object it will be his anxious endeavour to accomplish.—Dec. 16.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1855 *is now in the press, and will shortly appear. Due notice will be given in the columns of this paper.*

LYNCH'S STAR OF THE WEST CUCUMBER, *the best frame variety in cultivation. For description, see* RENDLE'S "*Price Current and Garden Directory*" *for* 1855.

Price 1*s.* 6*d.* and 2*s.* 6*d.* per packet.—Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

NEW SEEDS JUST HARVESTED *can now be obtained of the most genuine description, from* WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

DAWE, COTTRELL, AND BENHAM'S Wholesale FLOWER SEED CATALOGUE is now ready for the Trade. Post free on application.—3, Laurence Pountney Lane, and 36, Moorgate Street, London.
Established 1720 at 28, Cornhill.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

NONPAREIL PEAS.

WILLIAM FAIRBEARD begs to inform the trade that he is now ready to execute any orders he may be favoured with. This Pea W. F. is confident will become a general favourite both for Garden and Field culture. Price can be had on application.—Mount Pleasant Nursery, Queen Street, Sittingbourne, Kent.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s.* per lb. smaller quantities 2*s.* 6*d.* per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

HOLLYHOCK SEED.

R. PARKER has now ready for sending out Seed of this year's saving from the finest named varieties in cultivation, in packets at 1*s.* and 2*s.* 6*d.* each. A remittance or reference to accompany all orders from unknown correspondents.—Paradise Nursery, Hornsey Road, London.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

EXOTIC NURSERY, CHELSEA.

JAMES VEITCH, JUN., will be happy to forward his new Retail VEGETABLE, AGRICULTURAL, AND FLOWER SEED LISTS on application, and desires to assure those who may kindly favour him with their orders, that he has spared no pains in procuring his supplies from the first growers on the Continent as well as in this country, and that he will use his best endeavours to give his customers entire satisfaction.

GEORGE JACKMAN begs to announce that he has just published a new and complete CATALOGUE of his Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.

Woking Nursery, 1½ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—December 16.

SEED WHEAT.—Samples and Prices of RED HYBRID, NURSERY, and other kinds of Wheat from the CHALK, sent on application to Mr. H. RAYNBIRD, Basingstoke.

The Red Hybrid and Nursery are well suited for late sowing after Turnips.

TRUE SEED POTATOES.

JOHN BELL, POTATO SALESMAN, Covent Garden Market, and Great Northern Railway, King's Cross, London, offers the following:—

	Per bushel.—*s.*	*d.*		Per bushel.—*s.*	*d.*
Ashleaf Kidneys	7	0	York Regents	4	6
Lapstone	6	0	Hens, Nest	6	0
Early Cockney	9	0	Fortyfolds	5	0
" Shaws	4	6	Orkney Reds	5	0
Scotch Cups	4*s.* 6*d.*				

Terms cash. The usual allowance to the trade.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s.* per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s.*, bags included. To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

EARLY SEED POTATOES.—Jackson's Improved Thorough High-bred Early Ashleafs, price 9*s.* per bushel, and the celebrated Short-tops, 7*s.* 6*d.*, are unequalled for quality and yield; they by far surpass the "old stock," which is generally a sluggish bearer. British Queens, 7*s.* 6*d.*, the earliest round variety, known; Early Frame and Ashleaf Seedlings, 8*s.*; Regents, from prepared cuttings, 6*s.* Free to London; no charge for sacks. JOSEPH WILSON, Seedsman, Ipswich.

THE PAMPAS GRASS, GYNERIUM ARGENTEUM.

LUCOMBE, PINCE, & CO. have a fine healthy stock of this highly ornamental plant, well established in pots, and fit to send out immediately.

Specimens of it are now and have long been flowering in their nursery, and it is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See woodcut and description of it in *Gardeners' Chronicle* of the 4th ult.

Sizes, prices, and all particulars may be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.

FINE TRAINED FRUIT TREES IN A BEARING STATE.

LUCOMBE, PINCE, AND CO., have this season for Sale a remarkably healthy stock of fine trained FRUIT TREES of all the best sorts, to which they respectfully beg to call immediate attention. Prices and particulars to be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.
ESTABLISHED 1720.

SEEDLING FOREST TREES AND SHRUBS.

DAVID REID AND SON, NURSERYMEN AND FLORISTS, Leith Walk, Edinburgh, beg to direct the attention of the trade to their Stock of Seedlings as above.
Catalogues free on application.

W. AND T. ANDERSON, SEEDSMEN, &c., can supply TREE SEEDS, including Larch, Spruce, Scotch and Silver Fir, Balm, &c., also Whin (Furze) and Broom on moderate terms.—Dundee, December 16.

FRUIT TREES, FOREST TREES, EVERGREEN SHRUBS, &c. Catalogues of the above may be had on application to WILLIAM BARRATT, Wakefield.
☞ A quantity of fine Transplanted White Thorns.

DWARF PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

EDWARD PARKE FRANCIS offers a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application. Strong Trees, showing Fruit Buds, 2*s.* 6*d.* to 3*s.* 6*d.* each.
Rose Nurseries, Hertford.

COLLECTION OF PEARS.—The Collection of nearly 100 Pears exhibited by RENÉ LANGELIER, at the Society for the Encouragement of Horticulture may be seen for a few days at Dungannon House, Fulham, where orders for the trees will be taken by Mr. GLENNY, Horticultural Agent, Auctioneer, and Valuer.

THE PRINCE ALBERT PEAR.—This fine late Pear is like the Beurré Rance, but is hardier, and in general keeps longer. Young healthy trees, on the Pear and on the Quince stock, on which it grows freely, 5*s.* each—price to London.
THOMAS RIVERS, Nurseries, Sawbridgeworth.

HALF STANDARD PEACHES, NECTARINES, AND APRICOTS IN POTS.—In addition to the dwarf trees in pots of Peaches, &c., the above can be supplied of the leading varieties; they have well ripened shoots full of bloom buds, and straight stems about 3 feet in height. The Apricots of one kind, the Peach Apricot, are 4 feet in height, and are also full of bloom buds. The above are well adapted for Orchard-houses with high roofs. Price 5*s.* each.
THOMAS RIVERS, the Nurseries, Sawbridgeworth.

SPECIMEN IRISH YEWS.

THOMAS JACKSON AND SON, having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

8 to 9 feet high, and 8 feet in circumference			...	63*s.*	0*d.* each.
8	"	and 4 to 5 feet	"	... 21	0 "
7 to 8	"	and 4 feet	"	... 15	0 "
6 to 7	"	and 3 to 4 feet	"	... 10	6 "
6	"	and 3 feet	"	... 7	6 "

Handsome smaller specimens at proportionately lower prices.
Kingston, Surrey.

LARCH AND SPRUCE TREES.

TO BE SOLD by private contract, at Edgefield, near Holt, Norfolk, 250,000 Excellent LARCH PLANTS, transplanted, 2 to 4 feet; 20,000 ditto SPRUCE ditto, ditto, 1 to 3 feet.—For price, &c., apply to Mr. ALEX. LAWRIE, Edgefield; if by letter, to be post paid.

TO BE SOLD, at very reduced prices, 10,000 very strong 2, 3, and 4-year old GOOSEBERRIES and CURRANTS, of the best sorts.—For further particulars, apply to LAKE & DYER, Nurserymen, Bridgewater.

PINE PLANTS.

R. GLENDINNING begs to offer the following kinds of PINE PLANTS, in 5-inch pots, well-rooted and perfectly clean, in a condition to shift into larger pots, or to plant out:—

50 MOSCOW QUEEN	12 BLACK JAMAICA
50 RIPLEY do.	12 PROVIDENCE
12 PRICKLY CAYENNE	Price on application.

Chiswick Nursery, London.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s.* per doz.; HOWARD'S PRINCE ALBERT, 12*s.* per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford, Dec. 16.

TO THE SEED TRADE.

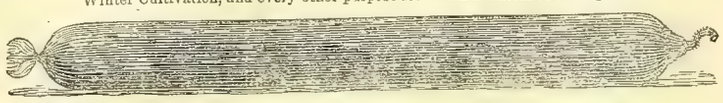
ABRAHAM HARDY AND SON, SEED GROWERS, beg to announce that their Wholesale Priced CATALOGUE of SEEDS, growth 1854, is now ready, and may be had on application.—Maldon, Essex, December 16.

GLENNY'S SUPERB BALSAM SEED from the largest and most double Flowers in the world. Six classes, 37 stamps; 50 seeds mixed, 13 stamps—in sealed packets only—with Directions for Culture.—Letters to Mr. GLENNY, Horticultural Agent, Auctioneer, and Valuer, Dungannon House, Fulham.

TWO NEW CUCUMBERS.

SIR COLIN CAMPBELL AND GENERAL CANROBERT.

THE ABOVE are two of the Finest and most Superb New Hybrid Cucumbers ever yet sent out for Exhibition, Winter Cultivation, and every other purpose for which a Cucumber is required.



SIR COLIN CAMPBELL CUCUMBER.

The above Cut is an exact representation of one of the fruit grown this summer, which measured exactly ten of its diameter long, being 25 inches, with not more than half an inch handle. It is a splendid Black Spine, of a dark green colour, and free from ribs or shrivels; grows very quick, sets free, and carries its bloom well. As a Cucumber for Exhibition nothing can surpass it, and is very prolific, often throwing out four or five fruit from every joint, and the vines are short jointed. The fruit is solid, and eats very crisp, and for market it keeps its bloom well for many days, not turning colour at the stem or point as most varieties do. Fruit was cut from the above in January last, and the same plants continued to produce fine fruit until the end of October.

GENERAL CANROBERT CUCUMBER.

This is also a most superb variety for winter cultivation, for which it is best adapted, being a hybrid from Lord Kenyon's Favourite and Phenomena. It has a great advantage over Kenyon's in length, growing to about 18 inches, in the same time in which Kenyon's will grow 12 inches; it is equally as hardy and productive. Of a dark green appearance, Black Spine, and a free setter; fruits freely during the whole of the winter, and always grows a very even size from stem to point. It will swell off two or three fruit at a time on a plant, during the depth of winter, and carry them out well, which it does with less heat than any other: this has been proved when several varieties have been grown together, this having the coldest part of the house. The object of the raiser of the above superb varieties has been to obtain perfection and hardiness, in which he has succeeded, by continually hybridising different varieties.

Sold in Packets of Five Seeds, 3*s.* 6*d.* each, or 1 Packet of Sir Colin Campbell and General Canrobert for 6*s.*

The following fine varieties of Cucumbers and Melons, which have been thoroughly proved and have given the greatest satisfaction to all Purchasers, can be supplied.

CUCUMBERS.

Captivation ...	... 2*s.* 6*d.*	Hunter's Prolific	... 1*s.* 0*d.*
Phenomena ...	... 2 6	Mills' Jewess ...	... 1 0
Lord Kenyon's ...	... 2 6	Cheltenham Surprise	... 1 0
Essex Hero ...	... 2 0	Manchester Prize	... 1 0
Victory of Bath ...	...1 0	Sion House True	... 1 0
Gordon's White Spine	... 1 0	Cuthill's Black Spine	... 1 0
Sunderland Wick	... 1 0	Conqueror of the West	... 1 0

MELONS.

The Queen ...	... 1*s.* 0*d.*	Beechwood ...	... 1*s.* 0*d.*
Bromham Hall ...	... 1 0	Windsor Prize ...	... 1 0
Incomparable ...	... 1 0	Emperor ...	... 1 0
Golden Ball ...	... 1 0	Fleming's Hybd. Persian	1 0
Bowood	... 1 0	Blackall's Green Flesh	1 0
Victory of Bath ...	... 1 0	Bailey's ,,	1 0
Camerton Court	... 1 0	Snow's Hybrid ...	... 1 0

A Packet of either of the Melons will be given to all Purchasers of the two new Cucumbers advertised above.

A Remittance must accompany every Order by Cash or Penny Postage Stamps, and the whole, or any part (as the case may be), will be immediately forwarded.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, and FLORIST,
14, Abbey Church Yard, Bath, Somersetshire.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of Mrs. Stanbury, was planted with Regent's Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. Baxter.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. Gordon, K.C.B., Marlee House, Blairgowrie.

"Sir,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. Jackson, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. Jackson's process may be widely known, as it is a great boon.—I am, &c.,

John Shanks,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. Austen, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. Charlwood & Cummins, Seedsmen, Covent Garden; and John Kernan, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

THE NEW CHINESE POTATO (DIOSCOREA JAPONICA).

MR. JOHN HENDERSON,

Formerly of the Firm of John A. Henderson & Co., Pine Apple Place, London,

Has the pleasure of informing the Public that he has just completed the Purchase from M. Paillet, of Paris, of his entire Saleable STOCK of the above introduction from China, the nutritive properties of which are said so far to surpass the ordinary Potato that it is likely, not only to act as an auxiliary, but entirely to supersede that valuable but uncertain esculent.

The most satisfactory results have followed from personal experiments, and proved that when cooked in the ordinary manner, from the large amount of farinaceous properties it contains, it can never become waxy, as is too generally the case with the Potato. Its flavour resembles in delicacy an early Ash-leaved Kidney; but, independent of the above excellent qualities, there is every probability of its taking a still more important position in the economy of this country, for, when dried and reduced to powder, it is equal to the best Arrow-root; or mixed in the proportion of one-third with two-thirds of wheaten flour, it makes an extremely light and wholesome BREAD, as well as very superior PASTRY.

Messrs. Vilmorin & Co., speaking of it, observe:—"Of all the esculent roots proposed as substitutes for the diseased Potato, the DIOSCOREA JAPONICA is certainly the only important one. It is easily propagated. The tubers are large and long, the flesh very mealy and devoid of any peculiar or disagreeable flavour. The DIOSCOREA JAPONICA is, in our opinion, a precious acquisition."

M. Pelé, Horticulturist, Paris, in his Supplementary Catalogue of this autumn says:—"A new alimentary root, introduced into France by M. Montigny, French Consul in China. Serious experiments have shown that this tuber will be much more advantageous to cultivate than the Potato, both in regard to its quality as well as produce."

M. Paillet, to whom the Imperial Society of Agriculture and Commerce of France has awarded the sum of 3000 francs as encouragement for having brought it into cultivation, also notices that "this tuber attains at least 1 to 2 lbs. weight. In its growth it is less delicate than the Potato, which unfortunately has of late years much degenerated. It does not require particular care, and its abundant produce amply repays cultivation. Its taste is pleasant, and being a root which contains a large amount of farina, will be a great addition to the FOOD OF THE PEOPLE as soon as it becomes generally known. It is so hardy that it has passed the winters of 1853-4 in the open ground, without having in the least suffered from frost. It is also found that the stems and leaves, which are very numerous, form an excellent FOOD FOR CATTLE."

Tubers, with description of the Chinese Mode of Culture, to be obtained of Mr. JOHN HENDERSON, Kingskerswell, South Devon, at the following prices, for cash only:—

4 Tubers ... ... £0 10 0 | 10 do. ... ... £1 2 6 | 50 do. ... ... £5 5 0 | 100 do. £10 0 0

Post-office orders are requested to be made payable at Newton Abbot, South Devon. The usual discount allowed to the trade when not less than 50 are taken.—P.S. All orders unaccompanied by a remittance will be considered as not received.

TO THE SEED TRADE.

MESSRS. ARTHUR HENDERSON AND CO. are now prepared to supply SEEDS of the following recent introductions.

N.B.—Mr. W. H. Dennett (the raiser), Seed Grower, Dedham, Essex, will also execute all orders intrusted to him with the greatest care and attention.

WHITE TOPPED CLARY, a fine showy hardy annual, remaining a long time in flower—

1 oz. ... 5*s.* | 4 oz. ... 15*s.* | 8 oz. ... 25*s.* | 16 oz. ... 40*s.*

LIMNANTHUS SULPHUREA ODORATA; yellow ground, edged with white and rose-coloured stamens; a beautiful trailing hardy annual, very sweet scented, and throwing off its fragrance like the Mignonette, and continuing in flower for a considerable period:

1 oz., 10*s.* 0*d.* | 4 do., 35*s.* | 8 do., 60*s.* | 16 do., 100*s.*

DIANTHUS DUNNETTII SUPERBUS; very dwarf, fine dark Sweet William—

1 oz., 20*s.* | 2 oz., 35*s.* | 4 oz., 63*s.* | 8 oz., 105*s.* | 16 oz., 163*s.*

Pine Apple Place, Edgeware Road, London.

SPLENDID NEW RHUBARB.
SALT'S CRIMSON PERFECTION.

ROBERT SALT begs leave to inform the Gentry, Nurserymen, Gardeners, &c., that this splendid variety of Rhubarb is now ready for distribution. It is universally allowed to be the most early, prolific and delicious variety ever offered to the Public.

See *Gardeners' Chronicle* June 11, 1853: "Very good, and of a most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."—Ed.

Certificates of Merit were awarded for specimens exhibited at the Meeting of the Horticultural Society, Regent Street, London, June 28th, 1853—at Nottingham, May 24th, 1854—at Derby Midland, May 25th, 1854—at Ormskirk, Lancashire, August 30th, 1854. Price 7*s.* 6*d.* per root, 3 for one guinea, and 6 for 21.

Orders addressed to Robert Salt, Longton, Staffordshire; or the following agents, will have immediate attention: Messrs. Hurst & M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess & Kent, Penkhull, Staffordshire; Mr. Wood, Nurseryman, Coppice, near Nottingham; Messrs. Francis & Arthur Dickson, East-gate Street, Chester; Mr. Salisbury, Melbourne, Derbyshire. A liberal discount allowed to the trade. A Post-office order from unknown correspondents.—Longton, Dec. 16.

GRIGOR'S AQUILEGIA GLANDULOSA.—To insure a vigorous display of this beautiful flower, the Subscribers can supply strong flowering roots, encased in bulbs of a congenial soil, similar to the plants which received the honorary premium of the Royal Caledonian Horticultural Society, in 1853. In reference to this beautiful Columbine, the Editor of the *Gardeners Chronicle* says:—"This plant is, perhaps, the handsomest hardy perennial in cultivation; its stems rise about 2 feet high, and sometimes carry from 50 to 80 blossoms. The effect is beautiful in the extreme, and no description that we have formerly given of it has done justice to its exquisite appearance." The plants are adapted for the open ground, or they may be forced into bloom early in spring.—On the receipt of 20*s.* per dozen, packages will be sent carriage free to London or Edinburgh.

JOHN GRIGOR AND CO., Nurseries, Forres, N.B.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for Geraniums (show and fancy), French Geraniums, Fuchsias, Verbenas, Fairy Roses, Chrysanthemums, Heliotropes, Cinerarias, Calceolarias, Primulas, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

For further particulars, see Advertisement in previous Numbers. Catalogues forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, Proprietor.

GODFREY'S BLACK SPINE.
Splendid and Prolific Frame Cucumber.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom; average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2*s.* 6*d.*; 6 ditto, 1*s.* 6*d.*

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. Hurst & M'Mullen, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1*s.* each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, Dec. 16.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.	Pinus canadensis, 3 to 8 feet
Cedrus Deodara, in any quantity, from 1 to 3 feet high	Cupressus macrocarpa or Lambertiana, 4 to 7 feet
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants	,, thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Cedars of Lebanon, 3, 4, 6, and 10 feet high	Juniperus, Upright Irish, perfect columns, 3 to 7 feet
Pinus Douglasi, 3 to 10 feet	,, chinensis, 2 to 8 feet
,, insignis. 2 to 7 feet	Yew, common English, 3 to 8 feet
,, Menziesi, 3 to 7 feet	,, Irish, 4 to 10 feet
,, pinsapo, fine plants, 3 to 6 feet	,, gold-striped, 1½ to 3 feet
,, Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome	,, do., tall standards, 4 to 7 ft.
,, nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders	,, Dovaston, or Weeping, worked on tall straight stems
,, Montezumæ, 2 to 4 feet	Thuja aurea, the finest plants in the country
	Libocedrus chilensis, the finest plants in the country
	Large variegated Hollies
	,, Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to Waterer and Godfrey, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants Roses, and Nursery Stock in general.

LILIUM LANCIFOLIUM.

HENRY GROOM, Clapham Rise, near London, by appointment, FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that this is the best time to have Bulbs of the different varieties of this most BEAUTIFUL LILY. They are well adapted for the Flower Garden, American Borders, and Drives in Parks, being quite hardy. His Catalogue may be had on application.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4s. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9s. per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12s. per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

FLEMING'S HYBRID CASHMERE MELON.—The above new Melon was raised by Mr. Fleming at Trentham, and exhibited by him for the first time at the Great Meeting of the Horticultural Society of London at Chiswick on the 10th June last against a multitude of competitors, when it was awarded the first prize, and pronounced by the judges to be very far superior to all others produced, and decidedly the best Melon known. The entire stock is in the hands of the undersigned. Packets of Six Seeds, 2s. 6d.; of 15 do., 5s.

R. GLENDINNING, Chiswick Nursery, London.

GARAWAY, MAYES, AND CO. having succeeded in saving some fine SEEDS of that truly magnificent Lily, LILIUM GIGANTEUM, which are now well matured, they offer fine picked Seed at 25s. per 100. Fine, new, long prolific Cucumber Ne Plus Ultra, Victory of Bath, do. Syon House, Lord Kenyon's Favourite, Roman Emperor, Berkshire Champion, Manchester Hero, Pollington's Black Spine, Pollington's Early Prolific. Victory of Bath Melon, Bromham Hall, Camerton Court Green-flesh, Beechwood, with all other most approved kinds in cultivation, 1s., 1s. 6d., to 2s. 6d. per packet.

Durdham Down Nursery, Bristol, Dec. 16.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. Packets of seed, consisting of 20 varieties, selected from the best show flowers, 5s.; 12 varieties, 2s. 6d.; and from good double sorts, 1s.

Very superior Quilled German Asters, 12 distinct varieties, separate, 2s., mixed 1s. per packet. Also Choice French Asters, 12 varieties, separate, 3s., mixed, 1s. 6d. Fine Quilled African Marigolds, lemon and orange, 6d. per packet.

New Double Crimson ROCKET, excellent bedding plant for spring flowering, 6s. per dozen, or 2l. per 100. Double French White, 4s. per dozen, or 30s. per 100.

Saffron Walden Nursery, Dec. 16.

BASS AND BROWN'S NEW AUTUMN CATALOGUE, supplied free for three Penny Stamps. They have this season a very fine and vigorous stock of the finest Roses, among which are a number of very superb new Continental varieties, consisting chiefly of the perpetual class. The following selections will be highly approved,

ROSES.

100 Standards in 100 very superior varieties ...	...	£7	10 0
100 „ 50 „ „ ...	...	6	10 0
50 „ 50 varieties ditto, all selected from perpetuals		4	0 0
100 dwarfs and half standards, or all dwarfs, in 100 very superior varieties		4	0 0
100 ditto in 50 varieties, ditto		3	0 0
50 ditto in 50 varieties, ditto, all from perpetuals ...		2	10 0
Fine mixed dwarfs, per 100...		1	10 0

Hardy Herbaceous Plants, Hollyhocks, prize-named Gooseberries, Strawberries, Standard Dwarf and Trained Fruit Trees, Flower Roots, and a variety of desirable articles offered in selection for present planting, for which see *Gardeners' Chronicle*, Oct. 14, page 659, and Oct. 28th, page 690.—Goods, carriage free (not under 20s.), to all the London termini, and all Stations on the London and Norwich Colchester Line. Plants added gratis with orders of 40s. and upwards.

Seed and Horticultural Establishment, Sudbury, Suffolk.

NURSERY AND SEED ESTABLISHMENT.
LEXDEN ROAD, COLCHESTER.
(ESTABLISHED UPWARDS OF THIRTY-FIVE YEARS.)

HORATIO BUNTING begs to announce that his extensive CATALOGUE of FLOWER and VEGETABLE SEEDS is now ready, and may be had on application, by inclosing two postage stamps. He can confidently recommend the articles therein enumerated, as nearly every article is his own growth, true to name, and of first-rate quality. Early orders will oblige, as the quantities of Lettuce and several other things are limited.—N.B. Please to observe the Address.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

J. AND J. FRASER have to offer a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application.

In offering these Pears, grafted on the Quince stock, we would wish particularly to call attention to their many excellent qualities. They are very compact in growth, and most prolific in bearing, fruiting profusely while the trees are small; thus forming a great acquisition for a small garden. Planted by the side of walks, in addition to their utility, they add much to the neatness and beauty of a kitchen garden. Indeed too much can scarcely be said in favour of these miniature Pear trees; as a proof of their merit the demand for them is yearly increasing.

Strong Trees, showing Fruit Buds, 2s. 6d. to 3s. 6d. each.

Lea Bridge Road, Essex, December 16.

J. AND J. FRASER beg to offer strong Standards of the following new ROSES, viz.:—

HYBRID PERPETUALS.

Alexandrine Bachmeteff, 3s. 6d.	Mrs. Rivers, 2s. 6d.
Baron Heeckeren, 3s. 6d.	Prince Leon, 5s.
Comte de Nanteuil, 3s.	Souvenir de Leveson Gower, 5s.
Docteur Juillard, 3s.	Triomphe de Paris, 5s.
General Castellane, 5s.	Bourbon, Paxton, 2s. 6d.
Gloire de France, 5s.	Reveil, 3s. 6d.
Jules Margottin, 5s.	Scipion Cochet, 2s.
L'Enfant du Mont Carmel, 3s.	Perpetual Moss Andre Thouin, 5s.
Le Leon des Combats, 2s.	Tea scented Melaine Willermorz, 3s. 9d.
Madame Domage, 5s.	Vicomtesse de Cazes, 3s.
Madame Fremion, 2s.	China, Citoyen de deux Mondes, 2s.
Mère de St. Louis, 2s. 6d.	

If one dozen are ordered the purchaser may select one in addition as a compensation for carriage. For a description of these new Roses, see Rose Catalogue, which may be had on application.—Lea Bridge Road, Essex, Dec. 16.

CUCUMBER AND MELON SEEDS.

JOHN CATTELL, Nurseries, Westerham, Kent, begs to offer the following sorts:—

CUCUMBERS.

First-rate sorts for early framing, &c., per dozen seeds, 13 penny stamps.

Sion House (Lord Keynon's Favourite)	Victory of Bath
Emperor	Manchester Prize
Man of Kent	Walker's
Carpenter's Wonder	Warwickshire Hero
Norfolk Hero	Kerryson's Prize
	Aban's Conqueror of the West

Approved sorts for frame or ridge, two dozen seeds, 13 penny stamps.

Cuthill's Long Black Spine	Cuthill's Black Spine
Do. do. White do.	Chamberlain's Prolific

MELONS.

Finest sorts, per dozen seeds, 13 penny stamps.

Allnutt's	Large Oval
Beechwood	Montreal
Bellegarde	Scripta
Bromham Hall	Trentham Hybrid (Persian)
Cantaloup	Victory of Bath

For description of Melons, see Advertisement in *Gardeners' Chronicle* of December 9.

RENDLE'S COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS *will be ready in a few days. They can be had to suit various sized Gardens at the following prices:—*

No. 1 COLLECTION	£3	0	0
„ 2 „	2	0	0
„ 3 „	1	5	0
„ 4 „	0	15	0

The quantities are fully detailed in their "Price Current and Garden Directory," a new edition of which is now in the Press.

WILLIAM E. RENDLE & CO., Seed Growers, Plymouth.
ESTABLISHED 68 YEARS.

GENUINE GARDEN SEEDS.

LUCOMBE, PINCE, AND CO., beg leave to announce that they have just completed their supply of the above, all carefully selected from the stocks of the best growers, superior in quality and economical in price, to which they respectfully call the attention of those who require a really genuine article. Their long experience in the Seed Trade (always also proving the vitality of their seeds before sending them out) fully justifies them in saying that their seeds cannot fail to give great satisfaction.—Catalogues may be had on application.

Exeter Nursery, Exeter. Established in 1720.

STRONG GRAPE VINES FROM EYES IN POTS.

LUCOMBE, PINCE, AND CO. *have this season a fine healthy stock of strong* VINES *of all the best varieties, raised from eyes which they can specially recommend, as the wood is well ripened and the roots very vigorous.* They have a few extra-sized Plants in very large pots in a full bearing state.

They have also a quantity of fine healthy Peaches, Nectarines, and Figs, well established in pots in a bearing state. Prices and further particulars to be had on application.

Exeter Nursery, Exeter. Established in 1720.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 16, 1854.

WE perceive that the remarks which have been made in this journal upon the CLIMATE OF THE South Western part of the CRIMEA have attracted the attention of the correspondents of our contemporaries, among whom are to be found some who continue to insist upon the extreme rigour of the winter in that part of the world, while others adopt more or less completely the opinions we have ventured to form from the evidence of known authorities. For ourselves, we beg to be excused if we prefer the statements of PALLAS and others, who speak from their own personal experience, to those of gentlemen who do not care to enable us to judge of the value of their testimony by giving their names. At present we adhere to the statements we have made; but if PALLAS was wrong we shall be ready to stand corrected, only it must be by some one having the same means of judging as PALLAS had.

Since this question is one just now of the highest interest we venture to repeat what we did say, in order to prevent misconception. On November 25 occur the following words: "On the hills it is cold enough we dare say; but there is no danger of the hands coming off with the gloves, or the feet with the boots, or of the musket barrels of our gallant troops burning their fingers. They are more likely to suffer *from rain than frost*, and we trust they will be effectually protected against both." If the reports from Sebastopol are to be credited, this view has been entirely confirmed by the event; for the camp is described as being so deluged with rain as to have become a sea of mud. On the 2d inst. we wrote as follows: "Upon the whole, we cannot doubt that the winter climate of the scene of operations is in no degree worse, at the worst, than that of Hampshire and Sussex."

What the mean winter temperature of our South downs may be we do not find recorded, but the following data, taken from DOVE'S tables, seem to bear out the opinions we have ventured to express.

	MEAN TEMPERATURE.	
	January.	February.
LONDON, *Neighbourhood of*	35° 14′	39°
Nicolaieff	24.51	28.49
Sympheropol	32.25	32.97
SEBASTOPOL	34.27	36.52
Vienna	29 28	33.53
Moscow	13.57	16.

From this we learn that the mean temperature of January at Sebastopol is not one degree lower than that of London. Even at Sympheropol, 700 feet above the sea, and nearly a degree to the northward, the difference is little more than $2\frac{3}{4}^{\circ}$, and yet it receives the cold north easterly winds before they can reach Sebastopol. Assuming, however, that the heights of Sebastopol have the same temperature as Sympheropol, which is improbable, since the former is more screened and more southerly, even then the cold of January is little greater than that of York. We have no cold in these islands equal to that of the continent of Europe; but most people know that even at Vienna no such formidable cold is felt as that with which one of the correspondents of the *Times* has terrified the public; and yet at Vienna the mean temperature of January is 29.28, or 5° lower than at Sebastopol. On the other hand, at Moscow, where consequences something like what is spoken of do exist, they are brought about by a mean temperature nearly 21° below that of Sebastopol, or $18\frac{1}{2}^{\circ}$ below that of Sympheropol.*

Let no one imagine that these remarks are intended to show that the winter clothing demanded by the troops is less necessary than has been represented. Certainly we have no such purpose. What we wish is that the truth should be known, without exaggeration, which produces much additional distress among the friends of our noble army of heroes, and can do no possible good. The facts are formidable enough as we put them, and there is no need of misrepresentation in order to show that the houses which are leaving London in December ought to have been erected in the Crimea at the latest in November.

When we first touched upon this subject, we did not contemplate returning to it. Since, however, we have been obliged to do so, in order to show that the opinions we have expressed have been formed upon the most accurate data that exist, and upon the evidence of persons long resident in the country, we venture to occupy yet a little space with some further remarks on the productions of the Crimea, in which we again trust entirely to the testimony of eye-witnesses.

Every gardener knows that in hard winters, even near London, Cistuses of all kinds are killed; but we learn from MARSCHALL *v.* BIEBERSTEIN that *Cistus creticus* is not uncommon (minimè rarus) on the hills of the S. Crimea overlooking the Black Sea. PALLAS also relates that the Manna Ash, a tender tree near London, inhabits the warm southern dales; therefore the winters to which these are exposed cannot be worse than those round London. The same remark applies to the dyer's Sumach, *Rhus Coriaria*, which forms trees in the southern valleys, and which entirely justifies the inference we formerly drew from the presence of *Pistacia Terebinthus*, a tender tree common in the South Crimea, where it forms a trunk as thick as a man's body. We have lately heard the accuracy of our statement about the Caper plant questioned, and doubts expressed as to whether it really grows in the Crimea at all. We, therefore, beg to quote the words of our authority as to this: "Perfrequens in sterilibus subsalsis Tauriæ, ad pontum Euxinum, et in planitiebus

* Since the above was in type we have received two private communications upon this subject. In one the writer, who has some personal acquaintance with the Crimea, says "I have no doubt our troops are cold enough (at Sebastopol), but only from exposure to a temperature not lower in itself than that of its latitude near the sea—that, for instance, of the Apennines of Genoa, which exactly corresponds with Balaclava." The other correspondent says, "On consulting Dove's work on the temperature of the globe, with reference to the Crimean winter, I find the isothermal lines for October and March pass through England; for November, through Brussels and Nashville, U.S.; for December, through Vienna, Berlin, and Berghen; for January, through Berlin and Halifax; for February, through Vienna and Boston. From all accounts it is the mist which makes the cold more intolerable than in other places of like temperature. This would not affect the roots of plants such as those you enumerate." We have not Dove's work at hand, but the inference derived from his isothermal lines is difficult to reconcile with his own tables of temperature. For example, he gives the temperature of January at Sebastopol as 34° 27′, and that of Berlin 27° 72′, while to Halifax is assigned 20°. These numbers, and the others that apply to other places and other months are so irreconcileable, that we infinitely prefer the unmistakable evidence afforded by vegetation. Such covering of snow as lies at Sebastopol could not have much effect upon Jujube *trees* (*Zizyphus vulgaris*, not *Jujube*), Terebinth *trees* with trunks as thick as a man's body, and Manna Ash *trees*, although it might upon Caper *bushes*, and even such a vegetation as that of Cistus creticus.

caspico-caucasicis. Colliguntur Capparides ab incolis oppidi Kisljar et per omnem Rossiam divenduntur." (*Bieb. Fl. Taur. Cauc.*, II., 2.) This is said of the sharp-leaved variety of *Capparis spinosa*, called *ovata*. Pallas also mentions the Caper bush, and says it is called Shaitan-Karbus.

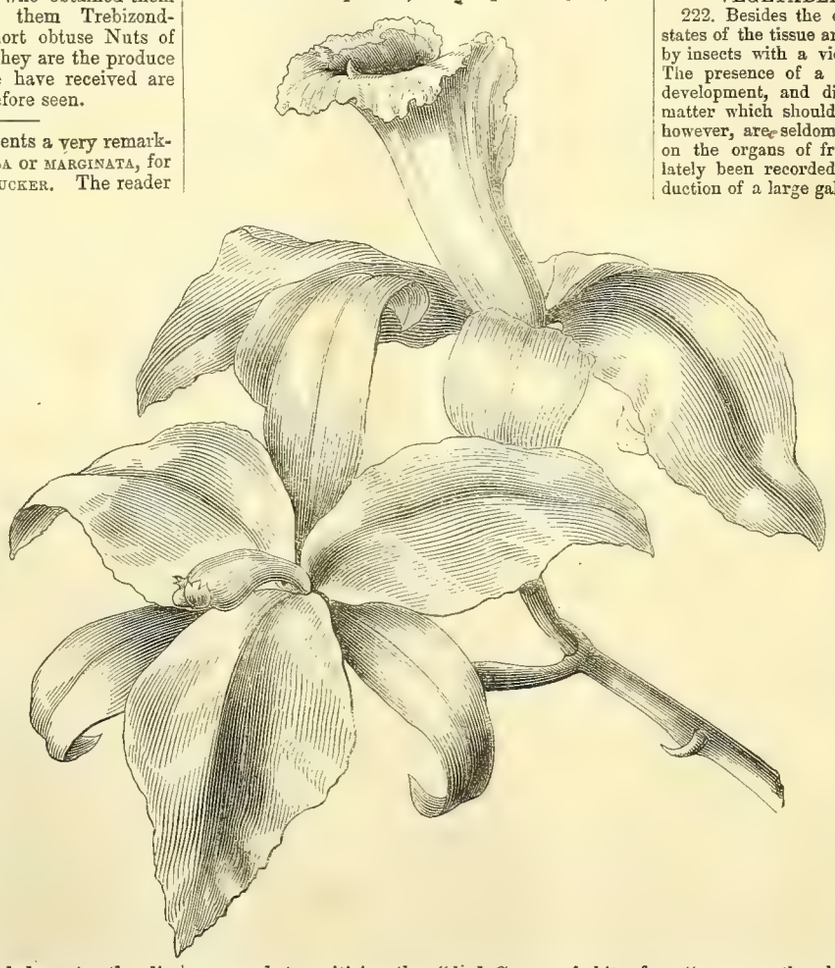
Pallas enumerates as many as 24 distinct varieties of Grapes cultivated either for wine or the table. Some of these are no doubt European varieties introduced, others are not recognisable as such. None of them appear to be of importance enough to deserve cultivation in this country. Far otherwise is it with the Apples of the Crimea, of which we hope that some of our officers will be able to secure cuttings when the fatigues of their campaign shall be over. Pallas speaks of one called Sinap-Alma, which keeps till July, and only acquires its excellence before the new year. Of this we are told that waggon loads are annually sent to Moscow and even to St. Petersburgh. There is also an autumn Apple, which a friend, who was on the south coast in 1847 or 1848, thought by far the best he had ever tasted in any country.

We must not omit, in taking our farewell of the Crimean climate, to mention the existence of a Cob-nut of extraordinary size, for a few specimens of which we are indebted to Captain George Elliot, R.M., of H.M. ship Arethusa, who obtained them at Eupatoria. Pallas calls them Trebizond-Funduk, describes them as "short obtuse Nuts of uncommon size," and says that they are the produce of *Corylus Colurna*. What we have received are larger than any that we have before seen.

The accompanying cut represents a very remarkable monster of Cattleya pumila or marginata, for which we are indebted to Mr. Rucker. The reader will at once observe that the lower flower has wholly lost the lip which is so characteristic of the genus, in place of which is a flat petal exactly like the two others. The column exhibited no peculiarity. The case in question furnishes another example of the singular tendency which Orchids have to sport from their ordinary condition, sometimes assuming forms wholly alien to their usual nature, but not less irregular; in other cases attempting, as it were, to revert to that regular type of structure to which it is the business of theorists to reduce them.

A similar instance occurs in the *Dendrobium normale* of Griffith, a plant occasionally seen in cultivation, which is also a sport from one of the common yellow Indian Dendrobes, but in that instance the column is also metamorphosed.

The loss of lip was not the only instance of transformation in the Cattleya before us. The other flower had produced a strong white tooth in the middle of its lip near the point, a circumstance which was owing to one of the three parallel ribs which naturally belong to the lip becoming free. The signification of this will be easily understood by the philosophical botanist.



From the many remarks formerly made in these columns upon the Lois-Weedon system of cultivation, our readers will be aware that we regard it as one of the most judicious examples of the application of science to practice, and of horticulture to agriculture, that has yet been recorded. We are, therefore, glad to be able to transcribe the following description of the present state of Mr. Smith's Turnip crop from the letter of an eye-witness:—"Planted in single rows, 5 feet apart, the tops again met across the intervals in August; and at the beginning of September Mr. Smith cut off the tops and buried them in the intervals as manure for his winter Beans to be sown the 1st of October. A fresh set of leaves was then thrown out from the crown of the Swedes, which evidently and beyond a doubt continued to grow; and when the crop was carted off a few days ago the sight of the fresh, green rows was really beautiful. It is a very heavy crop for the season, estimated, fairly I think, at 20 tons. It is very even, with a great portion very nearly as large as the two I send you. I understand that with a view to ascertain the real difference in quality as compared with Swedes treated in the usual way, Mr. Smith has sent a couple to Dr. Gilbert, of Rothamsted, for comparative examination. The winter Beans were up before the Swedes were drawn off."

Of the specimens of Turnips, mentioned by our correspondent, one weighed 11 lbs. 3 oz.; the other 11 lbs. 14 oz.; they were not so solid as some we formerly received from Lois-Weedon, and were evidently not genuine Swedes, but belonged to some one of the hybrid races.

Having thus adverted to Lois-Weedon, we avail ourselves of the opportunity of announcing the appearance of a new edition of the "*Word in Season*," in the new prefatory matter of which will be found some excellent remarks upon the subject of clay—a subject so important to the gardener as well as the farmer; since the knowledge of the existence in that despised description of soil, among other fertilisers, of the costly potash which is indispensable to vegetation, cannot but be of service to the cultivator, whether horticultural or agricultural. But the subject is too large a one to be treated incidentally, and we must refer to it at length in some future article.

We have had the misfortune, it seems, to hurt the susceptibility of a respectable German Botanist. In our number for April 22, of the present year, we presumed to criticise the "bad German habit of attaching to every supposed novelty a long Latin description, four-fifths of which are superfluous." At this Dr. Steetz, whose contributions to the Botany of the *Herald* called forth the remark, has taken offence. We really had no intention to say anything disagreeable to the learned gentleman; but it was our duty to animadvert upon a pernicious though well-meant practice, which has already rendered systematical Botany more chaotic, and infinitely more uninviting than it was when Linnæus swept away its rubbish; and upon reperusing the remarks in question, we are at a loss to know in what manner our opinion could have been expressed with greater courtesy, so that our meaning should be unmistakeable. Surely Dr. Steetz cannot think himself above criticism; and most certainly we have not regarded him as being beneath it.

The evil of which we presumed to complain has become so notorious, that proof of its existence is superfluous. It may, however, be worth while to point out what it goes to. In the instance before us we found four Compositæ, belonging to two vulgar genera, published as new species, each accompanied by the average number of thirty-one lines of technical description, or about ¾ of a quarto page. If works are to be written upon such a system, every species of plant will occupy, on an average, one quarto page, for mere technical matter, for to the description must be added the space required for synonyms, references, &c. Now, there are thought to be about 100,000 species of plants already discovered, a calculation which the majority of our botanical contemporaries will regard beneath rather than above the truth. The mere technical descriptions of them would, therefore, occupy a hundred thousand quarto pages, or *two hundred quarto volumes*, of 500 pages each. We venture to think that such a result, which would put an end to the study of systematical botany, is one that should be averted, if possible, by the friends of science, especially when it is considered that, in addition to the evil of tedious, prolix, and wholly unnecessary details is added the terrible and growing evil of multiplying what are called species to the most preposterous degree.

The truth must be told, whoever may be hurt by it. There is no doubt that some writers endeavour to conceal in a fog of mere words the want of clear and well-defined ideas, as well as of that critical knowledge which is indispensable in Natural History. And it is out of this that has arisen that legion of botanical phantoms which so effectually bewilder the inexperienced.

VEGETABLE PATHOLOGY.—No. L.

222. Besides the direct ravages of insects, diseased states of the tissue are produced by the punctures made by insects with a view to the deposition of their eggs. The presence of a strange body causes an abnormal development, and diverts a portion of the nutritious matter which should have gone to other parts. Galls, however, are seldom injurious, except when they grow on the organs of fructification. A case, indeed, has lately been recorded in this journal in which the production of a large gall on Oaks prevented the formation of fruit, and wherever they are produced abundantly there can be little doubt that the plant must suffer.

223. The injury derived from the animal world, though occasionally very great, is not in general to be compared with the more insidious attacks of vegetable parasites. As before remarked respecting predatory insects (with one or two exceptions), it is not the larger and more evident which are most destructive. A few phænogamic parasites indeed inflict from time to time considerable injury, but the minute parasitic fungi are always at work, pervading the tissues of the plants, at whose expense they live, and only waiting a favourable moment for their development.

224. The parasitic fungi vary considerably in habit, and are either real or merely apparent parasites. Those which flourish in the healthy sacs of the constituent tissue, or whose mycelium traverses their interstices in search of food derived through the cell walls by means of endosmose, or those, again, which are either wholly or partially external, imbibing nutriment by means of little swellings, which may be compared to the processes on the stems of Cuscuta, are entitled to the name of real parasites, while those which are developed in the first instance on decayed matter, even though they ultimately cause the death of subjacent structures, can be considered merely as false parasites.

225. That certain fungi do fructify within closed cells, and those to all appearance healthy, has been proved by several observers, and unless spontaneous or equivocal generation be admitted, it is equally certain that particles capable of producing fungi do traverse the tissues of healthy plants. Of those fungi, then, whose reproductive bodies, in whatever condition they may be, for the matter is oppressed with almost impenetrable difficulty, circulate with the juices in various parts of the plant, a vast number do not arrive at their perfect growth till partial or complete decay takes place. In some cases a diseased condition may be induced by the fungi, but this is not always true, as the parasites do not appear till cold or some other sufficient cause has produced fatal effects. The death of such fungi as have fructified within the cells, especially if they are at all numerous, may very possibly communicate a putrefactive taint to the surrounding cell walls, and produce disorganisation of the tissue, ending in more or less complete decay.

226. Many, however, as the whole tribe of fungi which produce rust and smut, with the exception of a few species only, do not fructify without establishing a communication with the external atmosphere, sometimes immediate, and sometimes through some thin interposed tissue. In many such instances the neighbouring tissue is to a great extent decomposed, and

either the general health of the plant is affected in consequence of the diversion of a large portion of its juices, or partial organs, especially those of fructification, are entirely destroyed. In a few cases, as in the gelatinous parasites belonging to the genera Podisoma and Gymnosporangium, which affect the different species of Juniper, and in Cyttaria, a genus which grows upon living boughs of the Beech trees of the southern hemisphere, the mycelium when once compacted into a cushion-shaped mass, produces year after year a new crop of fungi, ending in the destruction of the branch which has been attacked, and ultimately of the whole plant.

227. The white mildews are, for the most part, either wholly superficial or luxuriate in the large intercellular spaces of the spongy tissue, or the under sides of leaves. The same species, as for instance the grape mildew, is sometimes strictly superficial, and sometimes originates within the leaves, protruding its fructifying threads through the gaping stomates. In either case it lives upon the juices of the leaves and impedes the action of air and light, though not so completely as the black sooty Fumagos which are the pest of the Orange, Olive, and Coffee plantations of warmer climates, which are probably maintained by imbibition of matter from the atmosphere more than from the plants on which they grow.

228. The larger and more highly organised fungi are produced mostly on perennial plants. They originate probably in the first instance without exception on tissues already passing into decay; but inasmuch as their mycelium is perennial, when once it is established, as fast as the neighbouring tissues become tainted with diseased matter acting as a putrefactive ferment, it pushes forward its threads in search of fresh nutriment, and thus gradually effects the destruction of the largest trees. When such fungi for instance as *Polyporus squamosus, P. hispidus,* &c. make their appearance, the tree affected may be considered as doomed, though it may take some 50 years before the total destruction has been accomplished. Lichens and Mosses do not live upon the juices of the plants on which they grow, and so long as they are confined to the older parts, as the thick bark, they do no injury, but on the thin branches in which the tissues are still partially acted upon by transmitted light, Lichens are certainly injurious, and require to be checked or wholly removed. *M. J. B.*

BEURRÉ CLAIRGEAU PEAR.

At the exhibition of the Pomological Society, on the 6th of November, and of which a report is given at page 727 of the *Gardeners' Chronicle*, it appears that three fruits of the Beurré Clairgeau were exhibited; two of these from a wall with a south-east aspect, and the other from a pyramid on the Quince stock. These fruits were tasted; but part of the decision of the judges, we think, they will some day alter, when they have an opportunity of again tasting the fruit. All agreed that the fruits were remarkable, and they found that the flesh was tender and juicy, but not buttery, and the flavour watery and flat; and, accordingly, the variety was ranked second-rate.

The variety has but recently commenced bearing, and consequently its properties cannot be positively judged. The trees which bore the fruits in question have not been long enough planted to enable them to give to the fruit all the qualities it naturally possesses; perhaps there may have been other causes which ought to have been taken into consideration. Some account of the history of this variety may be interesting to pomologists.

On the 22d of October, 1848, Peter Clairgeau, a gardener at Nantes, France, exhibited to the Horticultural Society of that place specimens of fruit, obtained from the seedling tree, in order that they might be tasted, and their merits decided on. The form having been considered perfect, and the flavour excellent, M. Jules d'Airoles, Secretary of the Society, opened a subscription in order to obtain the seedling. A notice, accompanied with a drawing of the fruit, appeared, February 15th, 1849, in the "Revue Horticole" of Paris. According to this, maiden plants were to be supplied to the subscribers in the following autumn, provided the number of subscribers amounted to 200, but this not being the case, the trees were not delivered. In the meantime we had an opportunity of seeing two members of the Horticultural Society of Nantes, and we subjoin their statements respecting the vigorous growth of the seedling, even on the Quince stock; the beauty and good qualities of the fruit, two specimens of which we have now before us from Nantes. It remained to be ascertained whether the qualities would be the same in our climate. This was doubtless a difficult problem to solve. On the recommendation of M. d'Airoles we subscribed for ten specimens. The resolution was taken to cover the subscriptions and to purchase the seedling. It was thus that the parent tree and three hundred plants propagated from it, on Quince, were planted in different situations as regards soil and aspect in the open ground in our gardens. Moreover, a number of grafts, taken from the upper part of the original tree, were worked on stocks at standard height. From that time we have observed this plantation during the periods of its growth, flowering, and fruiting; and we have examined the fruits at the time of their maturity. In the autumn of 1851, nearly all the plants that had been two or three years propagated on Quince bore from three to six fruits, not only in one part of the garden, but in the different situations in which they had been planted. This circumstance is a proof of the hardiness and fertility of the variety. However, it was resolved not to send out a single plant until all the fruits grown on the Quince stock had been tasted. Among these fruits, some which commenced to ripen towards the 20th of October were found inferior in quality to those received from Nantes; but among some very large fruits grown on trees planted in excellent soil, we tasted several whose quality was equally as good as at Nantes. The maturity of the latter occurred about the 25th November. Having paid attention to this variety, we had a description made of it, 8th October, 1851. This was inserted at p. 143 of the "Album de Pomologie," accompanied with a figure of a handsome fruit, obtained in our grounds, and drawn from nature by a good artist, M. Yerna, of Brussels.

[The following are some extracts from the description alluded to; the original tree appears to have been raised about 1835 or 1836. The young shoots are short-jointed, of a bright brown, dotted with white specks; leaves nearly flat, lanceolate, the margins finely toothed. The parent tree was transplanted from Nantes to Brussels in the month of November, 1850, and had then many of its upper branches furnished with vigorous spurs.] The fruit was tasted on November 23, 1851, by M. Bivort, editor of the "Album de Pomologie," and the description was then completed. The fruit was very large, pyramidal, sometimes flattened on the side, and curved, about 4½ inches in length, and 3½ inches in diameter. Stalk short and very thick, but not fleshy, obliquely inserted. Eye in a small shallow cavity. Flesh white, fine, melting, buttery, with abundance of sugary and agreeably perfumed juice.

The Commission Royal de Pomologie Belge has given in its Annales, p. 29, a notice equally favourable. M. d'Airoles, of Nantes, who has seen the original tree in bearing for eight years, and the fruit of propagated plants for four or five years, has given a description of the variety, which is inserted in the *Gardeners' Chronicle*, p. 388. In our Catalogue for the spring of 1854 we have stated of the Beurré Clairgeau:—Fruit very large and long. Flesh melting, ripe in November and December. Tree vigorous, suitable for a wall, pyramid, and standard. There is, then, a great difference between the appreciation of the fruit by the British Pomological Society, from specimens obtained from Redleaf, and that by M. d'Airoles from fruit grown at Nantes, and also that by M. Bivort, from the produce of trees on Quince, in my garden.

Although we have cultivated this new variety of Pear during four years, we should not wish to constitute ourselves the arbitrators between the different opinions respecting the merits of the fruit; for we know, from long experience, that a certain lapse of time is necessary, and which experimental connoisseurs fix at from 5 to 20 years, from the period of the first production of a new fruit before, in consequence of comparative observations, a definite opinion can be given of the real merits of the variety. All that we can say at present is, that this new variety, the Beurré Clairgeau, originated at Nantes, is the most vigorous, hardy, and productive of all new sorts received from France. In order to preserve its qualities from deterioration in the climates of Belgium and England, we are of opinion that the variety ought to be worked on the Pear stock; or if worked on the Quince, the grafts should only be taken from trees growing on Pear stocks; otherwise the trees will degenerate in vigour and produce. The quality of the fruit will every year improve as the trees get better established, and are placed in situations found to be most favourable, as is the case with all other varieties of which the qualities approach to first-rate. With regard to the period of maturity, we may here mention that in four years we have had fruit ripe from the 20th of October till the 25th of December. The mean period appears to be the month of November. Without in the least suspecting the sincerity of any one, we believe we shall be rendering a service to amateurs by stating the results of actual experiment. *De Jonghe, Brussels, Nov.* 13. [Two ripe specimens accompanied this letter; one from a Pear stock, the other from a Quince. Both were melting, high-flavoured, and excellent; and by no means inferior to the best varieties of the season.]

FORCING THE RASPBERRY.

Fully acknowledging the intelligence and superiority of the English gardener above the continental ones, I yet venture to direct attention to the forcing of a fruit shrub, which seems to be doomed to oblivion, and which yet offers us such an excellent dessert. I mean the Raspberry, when forced, to be ripe in the latter end of May and June. I shall ever remember the splendid crops of the sweetest flavour which we raised when I was a journeyman at the Royal Hanoverian Gardens in Germany. It is true the Raspberry cannot be ranked as a first-rate dessert fruit even among the low growing fruit shrubs, but when the dessert has been ornamented for weeks with the universal favourite, the Strawberry, the Raspberry forms a good succession in the list of forced fruit, and is welcomed by our German gentry as a most desirable change.

Being a reader of the *Chronicle* for four or five years, it has been my custom to look through the columns for fruit growing and forcing with great interest, but I do not remember ever to have seen or heard anything relative to the forcing of the Raspberry. It is, however, very easily forced, and with uniform success. The *modus operandi* at the Royal Gardens of Hanover was as follows. In the latter end of October, when in our country vegetable vitality has ceased, we selected quantity of canes, choosing those which looked the most promising with respect to fruit buds. Without bestowing the exactitude which guides the English gardener in all his operations, we merely lifted them, picked off the embryo buds on the roots, which are so very troublesome during forcing if not removed betimes, and left as much soil on the balls as would adhere to them in lifting. We then potted them in 12 and 14-inch pots each, according to the size of the ball, cramming the roots rather than allowing them too much room. No especial compost was prepared for them, but the common garden soil was used, being in itself composed of rich and alluvial ingredients. After potting they received a good soaking, and were stored away behind a north wall or sheltered vacant place, and surrounded with a good thick layer of tree leaves when frost was threatening to set in.

French Beans were forced in the said garden very extensively, and the front shelves of the Bean houses were generally intended for an early set of Raspberry pots. But it is not my wish to enter into details about the early forcing of them, for in February and March they are rather deficient in flavour, and a plague in the houses, on account of the innumerable green flies which attack them if not very carefully syringed. We had, however, an upright wooden frame about 50 feet long, 5 feet high, and 4 feet wide inside measure. In this frame the Raspberries grew admirably. No artificial heat was applied, the frame being surrounded back and front with stable litter. Airing was performed on the top of the frame by pushing a piece of wood between the lights and the framework. In February the pots were brought into this pit, which was permitted to receive as much solar heat as was considered to be consistent with proper ventilation during the following months.

As the sun became more powerful syringing was necessary, and plenty of water was applied to the roots, and also to the old tan bed, in which they were plunged, in order to maintain a humid atmosphere. The young shoots were carefully tied to the back of the frame, giving each shoot room enough to be fully exposed to the rays of the sun. I forgot to mention that the canes were reduced to a length of about from 3 to 3½ feet previous to their being started in the frame. The neighbourhood of a few beehives, and plenty of air being allowed to play about the plants, rendered artificial fertilisation unnecessary.

By the above treatment we had a crop of Raspberries after the middle of May, and in June, which, I dare say, was unrivalled. Indeed, my employer enjoyed a high reputation for his Raspberries at the Court. I have myself every morning cut two or three scores for three weeks, dished them up in nice little baskets with a margin of bright green foliage so temptingly, that the Royal gardener used to allow no one but me to gather them. It will thus be seen how little skill, comparatively speaking, is necessary in order to insure a good crop of this truly estimable berry.

Respecting watering, I am decidedly of opinion that this should be done copiously, between the flowering and colouring. At that time they are greedy devourers of it, and as they have had no chance of establishing themselves after being potted, they are compelled to make up for the deficiency of newly made feeding rootlets by absorbing the water rapidly. Of course during the ripening process the supply is slightly diminished, and the then powerful sun gives the fruit a most delicious flavour. The end of August would doubtless be a more preferable time for potting, as they would then have time enough to establish themselves before winter, and would be in better condition for forcing, their treatment having been better suited for it from the beginning. My principal object, however, has been to show the facility with which this shrub can be forced, even when unestablished, which is so very important a point in the case of other fruits or flower shrubs in pots.

In conclusion, I must observe to those who may consider the Raspberry a mere second-rate kitchen garden fruit, of no value except for preserves and jellies, that the forced Raspberries are far superior in flavour to those grown in the open air, and have always been graciously accepted by the late King of Hanover and the late Duke of Cumberland, as well as by his courtiers, whose palates, I presume, might be considered authorities in such matters. *T. v. S.* (*of Germany.*)

New Plants.

106. Linum grandiflorum, *Desfontaines.*

We find in the last No. of the "Flore des Serres" a figure of this plant, which, if to be relied upon, shews that the species in question must be one of the finest annuals in cultivation. It has been already noticed at p. 39; but nothing then known to us led to the supposition that it could equal what is represented by Mr. Van Houtte's artist, according to which the flowers are at least 1¾ inch in diameter, and the colour of the deepest crimson Anemone. We are informed that it has succeeded perfectly with Mr. Van Houtte, in the *dry sandy soil* of his garden. The seeds were sown in the beginning of May. He calls it an "adorable" plant. He, however, points out the important fact that a very inferior plant bears the same name in trade, namely the Linum procumbens, also an Algerine species. This has been dispersed by the French seedsmen, from whom it was received by the Horticultural Society among others. It is a poor thing, looking like a dirty red Linum perenne, and not worth a moment's attention.

Home Correspondence.

Gynerium Argenteum.—How this has got the name of Pampas Grass I am at a loss to guess. It has been my misfortune to cross the Pampas twice, and no such Grass is to be found there—nothing but miserable brown stunted Grasses as far as the eye can see. The first time I saw the plumes of this Grass was at Corrientes, on the river Parana, in La Plata, but I was not able to find the plant growing till some months after, when I saw it at Cauza, on the Pilcomazo, a branch of the river Paragua, where it is abundant on the rich moist banks of the river. I saw it again at Sanguexuga, on the Paraná, in about lat. 19° S., and in several other places in San Paulo, in Brazil. I do not believe that it is found near Monte Video, but as I sail in a few days for South America I will do what I can to ascertain the fact, and procure seed, which I will forward to the Horticultural Society for distribution. A friend informs me that a short time back he saw at St Vulcen's, near Dublin, two plants of this Grass, which are probably the finest in Europe: one plant had 62 and the other 48 flower stems, 10 feet high; these plants are 11 years old. My friend was informed that the gardener at Woodlands, near Dublin, has propagated this plant with success—a fact at which I am not at all surprised, considering the knowledge he has of the habits of southern plants, having studied their growth in their native wilds. I last met him on Mount Santa Nova, in Brazil. I have not the least doubt that he can, if he feels inclined, throw some light on the subject in question. *A. W., Liverpool.*

"First Steps to Economic Botany"—Perfumed Teas.—In your Notices of Books last week your comments upon the above little work just published by me are less favourable than I could have hoped. "The First Steps to Economic Botany" is simply an abridgment of my "Popular Economic Botany," which you did me the honour to approve rather highly; you, however, pointed out some errors in a kindly spirit, and I thankfully accepted the correction, well knowing your more extensive means of information gave value to your suggestions. The errors you now mention were in that work, which doubtless contained many more not yet pointed out. This, I think, is almost a matter of course in the present state of our information respecting raw materials: I could point out very many in works professing a much higher character than mine. I will not attempt to defend the use of the term *hilum*, which word seems to employ an adhesion to Turpin's theory of the nature of starch granules; but it must be conceded that the term has been much employed by many authors of eminence, who have been perfectly aware that the granules are not adherent by the *umbilicus*. But, with respect to your remarks upon the perfumed Teas, I must protest against their correctness. I am sure, from actual experience, that you are in error. My daily occupations bring me in contact with the vast Tea imports of the Port of Liverpool, and many thousands of boxes of scented Teas have been examined by me this year. Orange Pekoes and scented Capers I believe are wholly perfumed with the flowers of Olea fragrans. Orange Pekoe is the most common scented tea, and if you examine a package you will find every leaf so beautifully twisted that the most perfect similarity exists throughout the whole of them; there are no fragments of any kind, and certainly not of Chloranthus flowers or leaves; but in the bottom of the package you will find about a tablespoonful of dust in which the minute petals and buds of Olea fragrans are often visible; the perfume of the Tea also is exactly that of the fragrant Olive. Scented Caper from its peculiar manufacture does not admit of such easy proof, but the odour is exactly similar. In the scented Tea, called "Flowery Pekoe," and in those green Teas which are sometimes perfumed, you may detect the fragments of Chulan in great abundance, but the odour of these Teas is not so much like Cowslips as the higher scented ones before mentioned. Moreover they are not so common as the orange-scented Pekoes and scented Capers, which now form a very large proportion of our imports. If I have been misinformed as to the growth and preparation of Teas in India, I shall gladly make the correction should I ever have the opportunity. I, however, thought I had consulted the best authorities. I have for many years read your Paper, and I should read with great satisfaction any article upon this interesting subject. *Thos. C. Archer, Higher Tranmere, Cheshire, Dec.* 11.

[We should be the last to depreciate the merits of Mr. Archer, whom we know to be a zealous and experienced investigator of the history of imported vegetable substances; nor should we have thought it worth while to criticise minutely the little work which has elicited these remarks had it not been intended for the young or very ignorant. Books for their use require to be written with the utmost care, for minute errors become in their minds the fruitful parents of misconception and confusion of ideas. If it is worth teaching young people such subjects as economic botany, and we think it extremely desirable, everything uncertain or conjectural should be omitted. It signifies little how small is the amount of knowledge that is conveyed to the young mind, provided it is incontestably true as far as it goes. With regard to the question of *Olea fragrans*, we can only say that if our correspondent will favour us with a little of the dust he speaks of, we will examine it and report publicly the result.]

Crocus Beds and Mice.—My Crocus beds are infested with mice to such a degree that I fear I shall not have a single blossom in the spring. Can you advise me how to set about remedying this evil? *F. R. S., The Bowers, Barkisland, near Halifax, Dec.* 8.

Early Cruffle Potato.—As this is a first-rate sort of Potato, and not generally known in the south of England (at least under this name), I am anxious to bring it under the notice of your readers. It is extensively grown here, much valued, and sells one-fifth higher than any other Potato, except of course the Ash-leaf, when it first appears in the market. It is an abundant bearer, of pretty good size, very round and slightly rough, with very shallow eyes. It, moreover, is an early kind, coming in 10 or 14 days after the Ash-leaf Kidney; and when it comes out of the pot, it cannot be surpassed for mealiness and excellence; since the disease appeared I have eaten none so good. I am of opinion that it should have the greatest breadth given to it both in the garden and on the farm. A correspondent in England thinks that the early Champion, spoken highly of there, is the same as our early Cruffle. He sent me a small one by post, but I am not quite sure that they are one and the same kind of Potato. *A. Pettigrew, Ballymenoch, Belfast.*

Cupressus Lambertiana and macrocarpa (see p. 789).—The distinction between C. Lambertiana and macrocarpa (or the plants so sought to be distinguished) seems to reside, in the absence of their respective fruits, in the stronger resinous scent of the latter when rubbed. Many Conifers have a tendency to vary in habit, *e. g.*, the upright and horizontal Cypress, the upright and horizontal or spreading red Cedar—perhaps C. torulosa and others might be added. Let the cones and flower be compared, and the question will be decided. *S.*——I do not think that C. macrocarpa and Lambertiana are synonymous. C. macrocarpa is in growth and habit superior to that much admired variety, C. Goveniana; its beautiful light green foliage and compact vertical growth, together with its extreme hardiness, make it more valuable than C. Goveniana, that variety being very apt to lose lateral branches by frost, which injures its appearance; a thing which very rarely occurs with macrocarpa. With us C. Lambertiana has foliage of a much darker green, and set, as Mr. Ayres says, horizontally; and although the young growth of the tree has rather a straggling appearance, it does not increase in size so rapidly as C. macrocarpa, until it attains the height of from 8 to 10 feet, when it works its way up more speedily than C. macrocarpa. It is easy to separate the two sorts from a bed in which they are intermixed by two important points, viz., C. macrocarpa seems to overgrow itself so much as to lack strength to support its elegant leader. Lambertiana, on the contrary, "as I have noticed in the very fine collection of Messrs. Lucombe and Pince, of Exeter, where they were side by side," grows more robust than macrocarpa, and promises to make a finer tree. That they are two distinct varieties we cannot doubt; but has the Horticultural Society no records of their introduction; if it examines it will doubtless find that though both come from California they are from different parts of that vast tract of country. Perhaps some one who has been in California, and seen them growing there, may be able to throw some light on the subject. *Aspasia Devoniana, Exmouth.*

Orange Trees.—Having a lot of these favourite trees under my care not doing so well as I should like, I am induced to ask some of your correspondents who manage Orange trees successfully what can be the cause of my failure, which consists in their foliage changing to yellow in summer, and to a great extent dropping off. They are kept in a large metallic house (glazed with 21-ounce sheet glass), which was built two years ago, partly for the Orange trees, and partly for a late vinery. The house is furnished with pipes connected with the boiler of another house. The heat is, however, never turned on except on frosty nights, when it is required for other plants, which are kept in the same house. The Orange trees are from 5 to 8 feet high, and are planted in red deal boxes, 2 feet square, in which they have all been planted within the last four years, from the boxes of the same size, which were decayed. The boxes are filled up with a compost of very rotten turf, taken from a sheep pasture, with some leaf mould mixed with it, and each box has 2 or 3 inches of broken tiles in the bottom for drainage. The trees are arranged along the principal walk in the kitchen garden from the beginning of June until the beginning of October, exposed to the full influence of the sun; and they begin to turn yellow soon after they are taken out, and after being out about a month they begin, as I have stated, to drop their foliage; and soon after they are taken indoors they begin to break out all over afresh. Several times in summer they are watered with liquid manure, and the surface of the boxes is covered with sheep dung. They flower abundantly in the spring, and bear an enormous quantity of fruit, some of them very large. A few years ago they were grown in a house having glass only in front, and which never had any artificial heat applied to it in winter, and they were turned out under the shade of large trees in summer. They remained then always very green, flowered in summer, and never bore any fruit. Some advice on the subject would much oblige. *A. M. D.*

Beurré Superfin.—This and the Cumberland Pear are two distinct varieties, and neither of them was raised by Dr. Van Mons. Beurré superfin originated at Angers with M. Goubault, where the original tree is still growing, a fact which M. de Jonghe can satisfy himself of either by writing to the President of the Horticultural Society there or by ocular demonstration the first time he visits that place. The Cumberland is an American variety, and the original tree is still existing where it was raised, at Cumberland in Rhode Island, hence the origin of the name; so that the story about the Duke of Cumberland is entirely fabulous. That Dr. Van Mons was the first to disseminate the Cumberland Pear in Belgium is not at all improbable; but that he raised it is not the case. These two Pears therefore being distinct varieties, there can be no doubt that M. de Jonghe is growing the Cumberland for Beurré superfin; and that M. de Jonghe does not know Beurré superfin is also evident from the fact that the description he gives of that variety in the *Gardeners' Chronicle* is a *verbatim* copy of the description of the Cumberland Pear, taken from the "Album de Pomologie," and not from observations of his own. The description I have of Beurré superfin, taken from observations of my own, is — Fruit obovate, narrowing abruptly towards the stalk; skin lemon coloured on the shaded side, but considerably covered with thin pale brown russet. On the side next the sun it is so much covered with cinnamon-coloured russet that none of the ground colour is visible, except small spots here and there, and the whole of that side assumes a slight orange tinge when fully exposed to the sun's influence. The stalk is woody, but fleshy at the base, 1¼ inch long, and inserted without depression; eye very small, set in a shallow basin; flesh very fine grained, buttery and melting, very juicy, with a brisk and piquant flavour peculiar to itself, and with a delicate perfume of musk, which is so slight as not to offend the most fastidious taste. Ripe in the middle of October. *Robert Hogg.*

The Fluke Potatoe.—I had a small quantity of this Potatoe given me by a friend in March last, for the purpose of testing with other sorts its capability of resisting the disease. Although it has not so fully maintained its high character here as to be proof against the attacks of the evil, it has notwithstanding been so little affected compared with all other sorts, both early and late, grown precisely under the same treatment, that I consider it worthy of recommending for more extensive cultivation. Although the crops were much injured throughout the north of Scotland by early attacks of the malady, yet there were evident signs of its getting weaker, and of its losing much of that virulence which it had in former years, when whole fields would change colour in a week or ten days. The plague-spot was first observed here on the 2d of July, on some early sorts, and it soon afterwards became general in the fields, but so slowly did it progress, that those which were planted late were still green in the fields near the end of September, and the Flukes above mentioned growing adjacent to where the disease first broke out were still partly green in the first week in October, and upon taking them up a few only were found to be diseased; they were a large crop and of excellent quality. *J. Webster, Gordon Castle, Dec.* 11.

Grape Growing (see p. 774).—Will Mr. Hall be so kind as to furnish the names of the varieties of Grapes which he grows to the weight of 6 lbs. per bunch. If he alludes to the Syrian or White Nice, I do not think very much of it; but if he grows Black Hamburghs, Muscats, &c., to that weight, then I must confess that he is leaving some of us in the rear as regards Grape growing. *A Grape Grower, Dec.* 12.

Pear Growing.—That the public discussion of a subject is likely to elicit something useful there can be no doubt, provided the subject is conducted with candour and a close adherence either to facts or well grounded opinions. Now in the matter of "Pear growing," I find myself opposed to persons I did not expect to see ranged against me, and I somewhat reluctantly take up my pen in defence of the party by whom our metropolis is in a great measure supplied with fruits, and feel surprised at some of the reasons thrown out why we are not able to do so more extensively. Mr. May says that the crop of Pears is often lost owing to the careless way in which the fruit is 'gathered the preceding year. This idea is certainly entirely new, and exactly at variance with what, since a boy, I have been led to believe; for we invariably encourage rather than try to prevent the breaking out of some of the spurs or embryo buds, thinking that in so doing the remaining ones will attain more vigour that autumn, and blossom stronger the next year. Mr. May also tells us how to mix the ingredients in which the trees are to be planted; this is no doubt very well, and in the places he mentions, will for a time doubtless be attended with benefit; but I would like to ask him if he ever knew a case wherein Pears were profitably grown for the world's market (not private sale) on ground which required so much artificial preparation (remember I grow for the million and not for isolated individuals who might perhaps be inclined to put a fictitious value on the fruit they use); and I may state further that the ground my Pears are growing on contains by nature most of the ingredients Mr. May advises to be added by art, for it is a light hazel loam resting on a sort of soft shingle, which at the depth of a few feet becomes gradually harder until it merges into limestone. This dry substratum seems to suit most sorts of fruit trees very well, for they generally thrive and produce abundance of blossoms; but, alas, it does not become all fruit, neither does it always happen that the fruits which it does produce are alike in quality. During the present year I gathered 3 or 4 bushels of fine healthy Crassane Pears from a young tree, which last year produced only a peck or two of gnarled, cracked, useless rubbish, and the Beurré Diel and Duchesse d'Angoulême presented similar symptoms of diseased fruit last year, and have been good this. Now

assuredly no one will say that the above result was owing to any particular treatment they received, since that was the same in both seasons, and no quantity of brickbats, rubble stone, or mounds of compost mixed with mathematical precision could have prevented it. The question therefore arises—"Are the varieties we are in the habit of growing the best adapted to our climate?" On this subject I have considerable doubts, though I have but little hopes of our ever competing successfully with our continental neighbours, while we have our usual atmospheric influences to contend against. Some horticultural writers have sneered at what they call our bad management, but I can endure it very well, until it can be pointed out how I am to make sure of a good crop of Pears each season, by some mode not more expensive than the extra value of the fruit. Until this is done, I must be content to let my trees remain where they are, some of which are three-quarters of a century old, and be satisfied with gathering such fruits as our precarious seasons admit of. I am willing, however, to try experiments, but I feel less sanguine that way than I was some twenty or more years ago. Nevertheless, some of the points insisted on by M. de Jonghe shall have a fair trial, and I may add on as fair a field for the purpose as most have. *H. S. H.*

Societies.

LINNEAN, *December* 5.—W. YARRELL, Esq., V.P., in the chair. N. B. Ward, Esq., exhibited a series of specimens of Asplenium lanceolatum, collected on disintegrating sandstone banks in the island of Jersey. The specimens, which had grown almost close to each other, were intended to show the effects of exposure on plants of this nature, those from a situation densely shaded by surrounding vegetation having formed vigorous well-proportioned fronds of from 15 to 18 inches in length; whilst others from the upper parts of exposed banks of the same soil were only from 2 to 3 inches long, and altogether stunted in appearance. Other specimens from the interior of a well showed a corresponding vigour of growth with the former. The following papers were read:—1. "On Decaisnea, a remarkable genus of Lardizabalaceæ," by Drs. Hooker and Thomson. 2. "Notice of a large fish left by the tide on a sand bank in Tees bay in September last," by J. Hogg, Esq., The fish was determined to be the Tunny, and was remarkable from the presence of hard horny scales embedded between the layers of the thick skin of its back, forming a very powerful defence against external attack. 3. "Observations on the identity of Pinus (Abies) hirtella and P. religiosa of Humboldt and Bonpland," by Dr. Berthold Seeman, and also communicated by the same, 4. "Remarks on Fossil Palms," by Dr. Goeppert of Breslau. In the remarks on the Abies, Dr. Seeman observes that, finding the specimens collected by himself in the western parts of Mexico, as well as those named A. religiosa in the herbaria of Sir W. Hooker and Mr. Bentham, and those growing at Kew and in other establishments, all to have hirtellous branches, and the only difference between the two species above named, insisted on by authors, consisting in the one having glabrous and the other hirtellous branches, he was led to suspect their identity. In order to determine this point he requested his friend Dr. C. Bolle, of Berlin, to examine Humboldt and Bonpland's original specimens of P. religiosa; and the result of this examination showed that they had, as suspected, hirtellous branches, and that the two were consequently identical. As, however, the two names were published at the same time, it became a question which to adopt for the species. Hirtella might perhaps seem most appropriate, as incorporating a botanical character; but religiosa being much more diffused, and equally appropriate (on account of the uses made by the Mexicans of its ornamental branches), Dr. Seeman concluded that religiosa should be retained. 5. "Extracts from a Letter addressed to Sir W. Hooker, by Mr. R. Spence, dated at San Carlos di Rio Negro, Venezuela, March 10, 1854." This letter contained a very interesting account of Mr. Spence's movements on the Orinoco and its tributaries, and will shortly be published elsewhere.

ENTOMOLOGICAL, *4th Dec.*—The President in the chair. After the announcement of numerous donations to the library by the Secretary, the chairman exhibited a remarkable specimen of the common orange tip butterfly, captured by Mr. Machin, the upper surface of which, as well as the antennæ and abdomen, agreed with the ordinary females of the species, but on the under surface the fore wing on the right side exhibited the orange spot of the males. M. Pretsch, Director of the Royal Printing-office of Vienna, exhibited a number of photographic figures of microscopical details of various insects, and explained the process by which they had been produced; several of them were, however, very deficient in clearness of outline of the articulations, although others, as the sucker of the common fly, were beautifully developed. He also exhibited a a number of entomological dissections, mounted as microscopical objects, and Mr. Westwood stated that he had received a quantity similarly prepared with great care from Mr. Menzel, of Zurich, who had established a microscopical emporium in Switzerland. Mr. Pickersgill exhibited a fine variety of Vanessa Urticæ, with the black spots of the wings suffused, and also a specimen of Argynnis Lathonia, taken at Eastbourne, in July. Mr. W. W. Saunders exhibited a curious patelliform nidus containing eggs, with an operculum, attached to plants received from the Amazons, probably the nest of a spider. Mr. S. Stevens exhibited a portion of the trunk of a wild Cherry tree, bored in various places by the larvæ of a Lamellicorn insect, most probably Trichius nobilis; specimens of Helops cœruleus were also found in the decayed parts. Mr. Tweedy exhibited a box of beautiful insects just received from St. Domingo. Mr. Westwood exhibited a small skein of the silk of Saturnia cynthia, grown and spun in Malta, which he had just received from the governor of that island, through Dr. Templeton. He had also received a number of cocoons, and notwithstanding the cold to which they had been subjected, the chrysalides were still found alive, so that he hoped to rear this fine Indian insect in London. Mr. Douglas read an extract from the Journal of the Society of Arts, stating the successful unwinding of the Cynthia cocoons at Turin, and that the larvæ had succeeded, when fed upon Willow and Lettuce leaves. Mr. Stainton read a note relative to the galls of Cynips Quercus petioli, which the writer had observed 20 years ago, and had used in manufacturing ink for his own use; and Mr. Curtis stated that the development of the galls was certainly the cause of the absence of Acorns on the trees, the place of the latter being usurped by the galls. Mr. Curtis also read a series of notes, containing lists of the different kinds of insects (chiefly Diptera) which he had reared from different kinds of wild plants. He also read a note from the Rev. Mr. Kuper, on the larvæ of Elater (Ctenicerus) castaneus. Mr. Westwood mentioned the recent acquisition of a specimen of the extremely rare and beautiful Papilio antenor, by the British Museum, from Madagascar. The locality of the species had hitherto been doubtful. Mr. F. Smith read a monograph on the British species of ants, describing 28 different species, together with notices of their habits, &c.

Notices of Books.

Village Development. Cox, Covent Garden.—This little volume contains many valuable hints and suggestions, in a letter written by an old vicar to a new incumbent, for the improvement (why development?) of the population of rural villages. It would be easy for any clergyman to carry out some of the plans here recommended, in any locality; but it is not so clear that the author has spoken from personal experience of the success of all, even in his own village. Some would probably be better adapted to one place, some to another, and we heartily recommend the whole to the attentive consideration of our rural clergy. Studied courteousness to all, upon all occasions, forms a prominent feature in his advice, even to "finding excuses for those who have gone astray." This is, perhaps, stretching an excellent principle to an extreme hardly compatible with the warning "not to desire that *all* men should speak well of us." He would inspire, and most justly, his poorer parishioners with a spirit of self-reliance, and allow them greater independence in certain cases than is usual with less judicious monitors, in regard to the administration of clothing clubs, &c. We most thoroughly agree with him in discountenancing prizes for "best brought up families, best church-goers," &c. As he justly observes, you are here placing a prize in front of a higher principle. We would recommend this sentiment to the serious consideration of all teetotallers, and whoever else prefer bowing down before pledges and medals to seeking strength at the throne of grace against grovelling propensities.

When speaking of the village library, he advises that "specimens of plants, fossils, shells, ferns, &c., should be gradually collected" in the neighbourhood, to teach a closer intercourse with nature. We wish he had gone further, and advised the grouping and classifying such objects on strictly scientific principles. But to teach such things requires the teacher should be first taught, and perhaps the good old vicar is no naturalist, or else his pen seems to have made a slip when intercalating "fossils and shells" between "plants and ferns," as though ferns were not plants.

Recs' Diary is one of the neatest almanacs in which Garden directions are to be found. We observe that it is a little enlarged this year. The directions are however very concise, as indeed is inevitable in so small a book.

Garden Memoranda.

MESSRS. JOHN WEEKS AND CO.'S NURSERY, KING'S ROAD, CHELSEA.—Those who wish to see the heating of horticultural buildings well carried out, on a somewhat novel plan, should visit this establishment, the numerous glass-houses of which are now all heated from one furnace. Until very lately there were six boilers of various sizes, but all on the same principle, employed here to heat the different houses and pits, and although those boilers were found both efficient and economical during eight years, recent improvements convinced Messrs. Weeks and Co. that highly important results were attainable by substituting one boiler, of a similar construction, for the six; and now the whole of the houses in the establishment are heated effectually by one tubular boiler, five feet high by three feet six in diameter, exposing to the immediate action of the fire a surface of 340 superficial feet. It is fed from the top, which is nearly on a level with the surface of the surrounding ground, but there are furnace doors, and the usual openings in the brickwork below, from which it is cleared out, and to cause a draft. The glass-houses, which may be said to be built round the four sides of a long square, or parallelogram, which has a gentle fall to the end farthest from the boiler, are certainly well placed for being all warmed from one boiler, which is effected as follows. The boiler is placed at, say the right hand corner of the square. A 4-inch flow pipe is led in a straight line from it on the same side to the bottom of the square, or as far as there are houses, and the return pipe is brought back to the boiler in the same drain immediately below it. Another main 4-inch flow and return pipe is taken through the show houses and down the other side of the square, to furnish means of heating the houses on that side, and from these two main pipes all the houses are warmed by connecting the pipes which are carried round them with the two main pipes just mentioned, which are also made to pass through as many houses as lie in their way; and in order that the heat they contain may be turned to as good an account as possible, the drains in which they are placed have been covered, inside the houses, with neat iron gratings, which permit the warmth to pass through into the house.

To these two flow and return pipes then the whole of the series of piping which warms the different houses in the place is attached, and as the hot water in them can either be turned on or off each house at pleasure, by means of valves, worked with a screw, every house and pit can either be heated separately or all together as may be desired. In this way every house has been effectually warmed, and that at a very great saving in fuel and labour. The importance of this new arrangement to horticultural establishments of any magnitude can therefore scarcely be overrated. We have already stated the size of the boiler, and to give some idea of the amount of work it has to do, we may mention that if the houses and pits were all placed in a line, they would extend about 1000 feet, exposing to the atmosphere upwards of 16,000 superficial feet of glass. The water is said to circulate in the various houses and pits through 5000 feet of pipe, and yet at the distance of 365 feet from the boiler the temperature in a pit can be raised, it is said, to 65° in about two hours.

The furnace is fed with coke, about 3*s.* worth of which is, we are told, consumed in winter in about 24 hours. The boiler is reported to require attention only once in 12 hours, and then but for one hour; thus occupying a man but for two hours out of the 24, at a cost of say 8*d.* per day. In fact so great is the saving effected by this new arrangement, that it is thought the expense attending the alteration of connecting all the pipes of the various houses and pits to one boiler, will be fully repaid in one season. Such at least is the opinion formed upon the subject by Mr. Weeks. Of course we have no means of testing its accuracy.

Where the main hot-water pipes pass under walks they are laid in drains among brick bats, kept together with tiles, and covered with gravel. The stoves and houses to be kept warmest are, as a matter of course, nearest the boiler, and the New Holland and Geranium houses, &c., are on the other or coolest side. The seed shop as well as show houses are also all warmed by the same apparatus, whose working has, as yet, been, as we have stated, perfectly efficient, and the great advantage of having only one fire to attend, instead of six, needs no comment.

FLORICULTURE.

ROSES OF 1854.—Never since Roses have been cultivated in England to any extent has such a fatal season as the past been experienced by the growers. The severe frost in winter killed nearly all the buds of the Tea-scented and other delicate Roses, and numbers of the plants. The dry weather in March and April destroyed from half to two-thirds of the stocks planted in December; and the frost on the 25th of April so injured the young and tender shoots, which were soon after smothered with aphides, that scarcely any Roses bloomed at their usual season in June and July. It was not till August that the Hybrid Perpetuals showed themselves in character, and after that they flowered satisfactorily. As usual with a favoured class of Roses like the above, we are inundated with so-called novelties from France, plenty of variety in names, lacking, however, difference in character; but there are some few really good and distinct, and quite worthy of a few words of praise, and so I will endeavour to describe them. Hybrid Perpetuals are *the* Roses of the day; they seem destined to supply all our out-door wants at least, and one is never tired of their varied beauties. There were 40 or more Roses of this class alone, with new names introduced last winter and spring, most of them of the same unvarying tints of "rose," "pale rose," and so on; many of them really good, but not differing enough from well established varieties to make them acceptable to the amateur. There are, however, a few and very few, distinct, good, and acceptable to all lovers of Roses; and who is not? Holding a first rank among the few is Jules Margottin, which is quite worthy of its descriptive English name, Perpetual Brennus; its very vigorous habit, and large finely-shaped light vivid crimson flowers, remind us much of that very fine old Hybrid China Rose, Brennus. For growing on its own roots, and pegging down, for a pillar Rose, and as a standard, it is equally well adapted, and will soon be in every Rose garden. Sir John Franklin and Gloire de la France are of the race of the Géant des Batailles, and

two fine robust growing Roses; the former bright red, the latter more approaching to deep crimson; they are two fine varieties. General Jaqueminot is, like the above, one of our new Roses, and most striking, from the size of its flowers, which are of rich shaded crimson. It has, however, two faults—its flowers are not sufficiently double, and its habit of growth is rather slender and delicate. We now require Roses perfect in all points; large and double flowers, opening freely, fine healthy foliage, and a vigorous hardy habit. Duchess of Norfolk will probably form a nice pillar Rose. Now we come to a host of new names applied to Roses, with shades of rose colour and pink, such as Alphonse de Lamartine, Colonel de Rougemont, Madame Domage (both varieties of the race of Baronne Prevost), Ceres, Gloire de Parthenay, La Ville de St. Denis, Lady Milsom, Madame Hector Jacquin, a large and vigorous growing Rose. Madame Harriet Stowe, Aline Gilbon, Mademoiselle Quetel, Marie de Bourges, Sephora, Triomphe en Beauté, James Veitch, Leon Plée, and several others, all pretty enough—for what Rose is not?—but with very little distinction in their characters. Gervaise Rouillard is a cheat; it is the old Hybrid China, General Lamoricière. Some few of the Roses among the Hybrid Perpetuals introduced in 1853 have bloomed this season in great perfection, and have proved themselves worthy of a place in every Rose garden. Such are Prince Léon Hotschoubey, or simply Prince Léon, which is a shorter and better name; and Paul Dupuy, two charming Roses. Alexandrina Bachmeteff, with its brilliant carmine flowers, is also a great acquisition, as is another Rose, with a tiresome Russian name, Prince Chipetouzikoff, with brilliant deep red flowers; Adam Paul is too double and large to open well in our climate. Souvenir de Leveson Gower is a magnificent crimson and first-rate Rose, and Triomphe de Paris, very dark crimson, has also bloomed beautifully. Lady Stuart, of the same colour, is not equal to Madame Rivers. Victoria has not opened well, and seems tender, as it suffered much by the winter. Archimède, Volta, and Ferdinand Deppe, are good rose-coloured and pink Roses, but not distinct enough. Among Bourbon Roses we have but one this season really worthy of attention, viz., La Quintinie; this is most superb, its deep crimson flowers are of the most perfect shape; but it has one fault, it is delicate in its habit, and requires the highest cultivation. François Herincq, also a new Rose of this class, is too much like Prince Albert, and Surpasse Comice de Seine et Marne. In Tea-scented Roses, we have one really fine and distinct, viz., Gloire de Dijon; in its foliage, habit, and shape, and size of its flowers, it is almost an exact resemblance of the Bourbon Rose, Souvenir de la Malmaison, and, like that fine Rose, it requires dry warm weather to open its flowers in perfection. Its perfume is Tea-like and powerful, and in colour it is quite unique, being tinted with fawn, salmon, and rose, and difficult to describe. Auguste Vacher is also a new Tea Rose, perhaps too much like Noisette Ophirie in colour and habit to be highly esteemed. It is long since we have had any new and good Noisette Roses; but this season a new variety called Augusta has been sent from America, which has bloomed in great perfection; it is of the race of Solfaterre, and resembles it closely in habit; its flowers are, however, more double and globular, remarkably elegant in shape, and in the centre of its flower it is a little deeper in colour. Another new Noisette Rose is Marie Chargé, of the Ophirie class; its flowers are larger, more brilliant in colour than that well-known Rose, and its habit seems very vigorous and hardy. *T. Rivers, Sawbridgeworth.*

CINERARIAS: *A B.* The marks on your Cineraria leaves are the galleries of some mining grub.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c. — Notwithstanding the many plants which we have suitable for flowering at this season, considerable foresight will be necessary to maintain a regular display for the next six or eight weeks, for it requires considerably longer time in the dead of winter to bring things forward than in spring with sunny days, and the naturally increased energies of the plants. But this should have been kept in view in the treatment of the plants throughout the season, so as to have induced those wanted for early forcing to mature their growth at a correspondingly early period, and where this has been the case, comparatively little forcing will be requisite to bring things into bloom, and there will be few or no failures. But where this has been neglected, and the plants are not well prepared, the most that can be done now will be to select the more forward and such as look the most promising for blooming freely, and place them in heat considerably earlier than would otherwise have been necessary. Where there is a good collection of Azaleas to work upon, a few of the commoner sorts may be placed in heat, for these are amongst the gayest subjects we possess for decorative purposes, and come in very useful where cut flowers are wanted largely. Some of the early pruned Roses should also be introduced to gentle heat, choosing some of the Teas, Bourbons, and Hybrid Perpetuals; these should be placed close to the glass, in a pit where they can be afforded a very moderate bottom heat, keeping the plants rather cool and airy for the first month, to insure their breaking strongly. Give every possible attention to the management of the house, so as to preserve the delicate blossoms from any excess of damp or dryness, endeavouring to preserve their beauty as long as possible, and regulate the application of fire heat, strictly with a view to maintain the atmosphere in the state which may be found most congenial for the inmates. Also spare no pains to maintain perfect neatness, keeping all the plants as trim and orderly as possible, occasionally shifting the position of any conspicuous pot specimens, which will greatly assist in adding to the interest of the house. GREENHOUSE.—Soft-wooded plants require very careful attention at present, for damp or insects soon do irreparable damage at this season. Pelargoniums should be kept rather cool and dry, giving whatever water may be necessary early in the day, so that the superfluous moisture may be dried up before evening. Give air freely on every favourable opportunity, and keep the plants near the glass, affording them plenty of room, and keeping the shoots tied out rather thinly to admit light and air among the foliage. If green-fly is perceived upon any of the specimens, let these be removed and smoked at once. Calceolarias are particularly liable to the attacks of green-fly, and the whole stock must be narrowly watched, and smoked lightly immediately that the enemy is perceived, for they rarely do any good if green-fly or thrips are allowed to gain a footing upon the foliage. Keep these also close to the glass, and supply them freely with air on mild favourable days, and look out for, and pick off fogged leaves, for these, if allowed to remain, often occasion the loss of the plant. See that those in free growth do not suffer for the want of pot room, and keep them growing as freely as circumstances will permit. Cinerarias should not be trusted any longer in cold pits where this can possibly be avoided, for they are very impatient of frost. These should also have an airy situation near the glass.

FORCING DEPARTMENT.

PINERIES.—Where the bottom-heat is maintained by tan or any other fermenting material it is very apt to fall off too much at this season while the temperature of the house is being kept low. If this is found to be the case, a slight surfacing of fresh tan should be applied, which in most cases will be sufficient; but if the beds have not been renewed for some time, and the tan has got spent, it may probably be necessary to remove the plants, and mix a quantity of fresh tan with the old. A quantity of tan should always be kept dry and in readiness for such purposes where shed room can be spared for it, for if it is used fresh from the tan yard it is very difficult to obtain a steady moderate lasting heat from it, and it is also liable to starve the roots of the plants before fermentation commences when used green in winter, and afterwards it heats much too violently. Let no trouble be spared, however, which circumstances may render necessary to secure a steady bottom heat, in order that the roots may be preserved in a healthy state, for without healthy roots it will be in vain to expect vigorous growth in spring. VINERIES.—We are now arrived at the period of the year when ripe Grapes require very nice management to preserve them from the ill effects of the prevailing damp, and of too much fire heat. Admit fresh air whenever the state of the weather allows of this being done with advantage, and use fire heat as sparingly as can be rendered effective in keeping the atmosphere of the house in motion and rather dry. Also examine the bunches often, so as to make sure of removing decaying berries immediately they are affected. Houses which it is intended to close for forcing the beginning of next month should have a little fermenting litter placed on the outside border at once, if it is intended to use this, for a little encouragement given to the roots before shutting up the house will greatly assist in getting the buds to push strongly, and without loss of time.

FLOWER GARDEN AND SHRUBBERIES.

Draining has now become so fashionable in most parts of the country, and its advantages so well understood, that it seems almost unreasonable to suppose that there are any instances in gentlemen's gardens where it is wanted and neglected. It is, however, a fact that there are many pleasure-grounds in the country that would be greatly improved by thorough draining. Wherever the turf becomes spongy and unfit to walk upon for days after heavy rains, there is an evident want of draining. But we do not recommend the application of a few shallow drains, as is still frequently practised, save where the mischief to be remedied arises from something in the way of a land spring, which, in most cases, may be remedied by a few drains. In most instances it will be found a much more effective plan to cut drains 4 feet deep, and from 8 to 12 yards apart, throughout the whole extent of the ground that requires draining, than to merely surface drain it in the worst parts. Where any work of this kind is required, the present is a very favourable season for executing it, and it should be done at once, so as to allow of the turf being yet made level for next summer. On strong marly or clayey soils it is very difficult to manage the filling up, so as to prevent considerable sinking afterwards, and if the work is done at once the winter rains will consolidate the soil, so that it will stand over next summer, and will probably require very little filling up afterwards.

HARDY FRUIT AND KITCHEN GARDEN.

Take advantage of every fine day that may occur to concentrate all the available strength upon the nailing, and get this in as forward a state as possible while the weather is comparatively favourable for such work. Also go over large standard trees, and thin out the branches to proper distances apart, so as to admit light and air freely among the branches when the foliage is on, and secure good sized well flavoured fruit, which can hardly be expected when the trees are neglected, and their branches allowed to get as thick as brooms. Also clean the stems of old trees of moss and Lichens by well scraping them with a piece of hoop iron, and then coating them with a thick wash of lime, soot, cowdung, and some soft soap, or wood ashes. Let there be no further delay in the preparation of ground intended to be planted with fruit trees, and get the trees in as quickly as possible. A mulching of decayed leaves placed over the roots of recently planted trees will be beneficial in maintaining the temperature of the ground somewhat more regular than would be the case without any such precaution, and it will also be useful to the young roots when turned into the ground. Look over the fruit in the fruit-room, frequently removing any that are found to be decaying, and putting aside any that are only slightly tainted for immediate use. Endeavour to keep the atmosphere moderately dry by admitting sufficient air on mild days to carry off the moisture exhaled by the fruit, and also keep the room cool. Any fruit that it is desired to forward the ripening of should be removed to a warmer room, and by no means keep the whole stock too warm, which would cause many sorts to shrivel and become worthless. See to the protection of any surplus stock of Snow's Broccoli which may be hearting.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Dec. 14, 1854, as observed at the Horticultural Gardens.

Satur. 23	43.5	32.2	37.9	14	1.13	4	7	2	2	1	7	1	4

The highest temperature during the above period occurred on the 17th, 1852, and 23d, 1839—therm. 57 deg.; and the lowest on the 17th, 1846—therm. 15 deg.

Notices to Correspondents.

AMHERSTIA: *J S.* We are unable to inform you. The great success which attended Mrs. Lawrence's management resulted in repeated blossoming. But we can give you no further information.

ARALIA JAPONICA: *An Old Sub.* The Aralia mentioned Oct. 10, 1846, was described as a variety called Maxima, not by us but by a correspondent. The true plant is what is technically called an under-shrub, that is to say, half woody half herbaceous. It grows as high as a man, has very large palmate leaves and whitish flowers.

BOOKS: *J Smith.* The title of the treatise on Pectinous matters respecting which you ask for information is "Chemische Untersuchungen über das Reifen der Früchte; Pektose, Pektase." Von E. Fremy. Deutsch von U. Graeger. Halle 1851. Information will be found also in Mulder's Physiological Chemistry (German Edition, 1851), Vol. 1, p. 244; and in Gregory's Handbook. *M. J. B.—A B.* Probably: but we are not certain. The "Penny Cyclopædia" now publishing appears in weekly numbers price 6*d.* each; and if you can spare as much is well worth your having.—*A Man of Kent.* Harvey's Marine Algæ and Greville's Algæ Britannicæ.

DIOSCOREA JAPONICA: *J F.* We have ascertained that under this name is meant the Dioscorea Batatas, concerning which we beg to refer you to p. 467 of the present volume, where you will find all that is known in England upon the subject. No recent French reports have appeared as far as we are aware.

INSECTS: *A B.* The insect sent in the quill, together with the empty skin, was the larva and its exuvia of the Museum beetle (Anthrenus Museorum) and not that of a moth.—*J F.* The difficulty in extirpating the minute young of the Coccus of the Beech bark, arises from their being so densely enveloped in the white waxy filamentous secretion which renders the trees which they infest so conspicuous. The application of an oily or a gummy wash would be more serviceable than turpentine. *W.*

NAMES OF FRUITS: *H B B, Daglingworth.* 1, Duchesse d'Angoulême; 2, Glou Morceau; 3, Winter Nelis; 4, Beurré Diel; 5, Easter Beurré; 6, Passe Colmar; 7, Beurré Rance; 8, Marie Louise; 9, Vicar of Winkfield; 10, Beurré de Capiaumont; 11, Jean de Witte.‖

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*W. F. S.* The fungus which has come up in the earth of some plants from South America is Bulliard's Agaricus nudus. The fleshy fungi of extra-European countries are so often identical with our own, that it is very possible the spores or mycelium may have been introduced with the soil. *M. J. B.—F J.* Maxillaria variabilis.—*A B C.* It is not possible to name either Grasses or Sedges when they are out of flower.

SCALE: *W S.* Try the effect of washing your Pear trees well with water heated to the temperature of between 150° and 160°. That has been found to kill scale without injuring the trees.‡

SILVER BEET: *A Subscriber.* If by this name you mean Chard Beet, the leaf-stalks only of which are eaten, it requires no blanching, and is cooked like Seakale.

VINES: *Reader.* We do not know who planted the large Vine now growing at Hampton Court, or when it was planted.‡

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

SUPERPHOSPHATE COMPOST COMPANY.—427, Strand, London.

The Directors having received numerous applications for Winter Wheat Manure, have the pleasure to notify to their Friends and the Agriculturists generally, that they have 1000 tons expressly prepared for drilling with Winter Wheat, and now ready for delivery at 7*l.* per ton net cash, that is, payment in one month. Carriage free to any Railway Station or Wharf in London. Further particulars may be obtained of the Agents.
W. W. WATSON, Secretary.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

HOSE PIPING.—GREAT REDUCTION IN PRICE.—PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM-ENGINES, AND COMBINED THRASHING, STRAW SHAKING, RIDDLING, AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as thrashed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. and Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading agricultural shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

LAND DRAINAGE.

MR. BAILEY DENTON'S TABLES OF COST, &c., price 1*s.* 4*d.* Sold by METCHIM, Parliament Street.

MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1*l.* 10*s.* Sold by JONES & Co., High Holborn, London.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

John C. Cobbold, Esq., M.P.	William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S.	Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq.	Samuel Morton Peto, Esq., M.P.
Thomas Edward Dicey, Esq.	William Tite, Esq., F.R.S.
William Wilshere, Esq.	

Empowered to execute, or to assist Landowners in executing with their own Capital, works of Land Improvement, viz., Drainage, Irrigation, Road-making, Enclosing, Reclaiming, and the Erection of Farm Buildings upon any Estates, under Settlement, Mortgage, or Disability, and without any investigation of Title, to charge the total amount of the outlay and expenses upon the property improved, to be repaid by annual instalments, varying according to the number of years over which Landowners may determine the repayment shall extend.
WILLIAM CLIFFORD, Secretary.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The first Session of 1855 will begin in February. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

The Agricultural Gazette.

SATURDAY, DECEMBER 16, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, Dec. 21—Agricultural Imp. Society of Ireland.

COVENEY'S "ECONOMICAL" MANURE.

A SHORT report from the daily papers is given below of a trial, "COVENEY *v.* LOVICK," before the Exchequer Court last Wednesday, in which the merits of the "Patent Economical Manure" seem to have been pretty fully published. The verdict was for the defendant. He is a Norfolk farmer occupying 600 acres of land under the Earl of LEICESTER. Seventy-seven pounds worth of the manure had been applied to the Turnip crop, which in due course came up, but the roots, instead of attaining the corpulence of a Turnip, had never exceeded that of a good-sized Radish. That being the case defendant had refused to pay the price demanded, on the ground that he had not been furnished with the genuine article. *The fertilising power of the real thing was no doubt extraordinary! all that the advertisement represented!!* but, if so, Mr. LOVICK had not received what he had ordered, and was not therefore bound to pay for it.

The jury agreed with Mr. LOVICK, and their VERDICT WAS FOR THE DEFENDANT.

COURT OF EXCHEQUER—WEDNESDAY. (*Sittings at Nisi Prius at Guildhall, before the* LORD CHIEF BARON *and a Common Jury.*) COVENEY *v.* LOVICK.—Mr. M. Chambers and Mr. James appeared for the plaintiff; Mr. Atherton and Mr. Holl for the defendant. The defendant in this action is a farmer, who occupies 600 acres of land in Norfolk, under the Earl of Leicester; and the plaintiff is the agent of a M. Papillot, a manufacturing chemist, and the inventor of the British Economical Manure, which it is almost unnecessary to state was, in the language of the advertisements, endowed with every fructifying quality that can be conceived, as well as the advantage of drawing to the soil the moisture of the atmosphere. Attracted by these, Mr. Lovick purchased a considerable quantity for 77*l.*, applied it to dress his Turnip land, and waited anxiously for the result. In due course the Turnips came up; but instead of attaining the corpulence of a Turnip, they never exceeded that of a good-sized Radish, and for the most part were never gathered. The season, moreover, was very dry, and the moisture which ought, under the influence of the manure, to have been deposited, remained, so far as the defendant was concerned, with all its other advantages, *in nubibus.* Such being the state of things, the defendant refused to pay the price, on the ground that the article furnished was not the genuine British Economical Manure. The fertilising powers of the real thing might be, and probably were, excellent; but if that were so, Mr. Lovick had not received what he had ordered, and was not, therefore, bound to pay for it.—On the other side arguments were used to show that the ingredients of the manure had been misused by the defendant himself, by being mixed in improper proportions, and that the plaintiff could not be responsible for the defendant's negligence.—The jury eventually gave a verdict for the defendant, expressing their belief that he did not get the genuine Economical Manure.

MR. MECHI's annual statement is looked for now not for the test which his balance-sheet affords of the soundness of his teaching—so much as for the opportunity it gives of discussing those tendencies and details of farming practice which it enumerates and insists upon. As to the balance-sheet itself, we do not suppose that the profit which it shows, whether actual or imaginary, teaches much this year when everybody has a balance-sheet as profitable; and many, farming far more quietly, a balance-sheet more profitable than any Tiptree yet can boast of. There are, however, certain points referred to in the statement which accompanies it, which deserve discussion here, and which will, we hope, receive it.

A single paragraph on one of them is all, however, that we can now allow. The unprofitableness of cattle-feeding which Mr. MECHI insists upon is, if true, a very heavy difficulty in the way of agricultural progress; but we are sure there are many men of large experience who differ from Mr. MECHI here. We were, only the other day, conversing with a Shropshire farmer who has often made from 8*l.* to 10*l.* per acre of his Swedes on 50 or 60 acres annually, by feeding cattle; and 9*s.* and 10*s.* per ton is often made in like manner by those who know how to breed and how to purchase stock. The question cannot be decided for all England by the answer which it receives on any single farm. The average truth is to be arrived at not only by a comparison of farms and varying circumstances of soil—but also by a comparison of farmers and varying circumstances as to skill, whether in marketing or in breeding.

It is impossible, we doubt not, to make feeding pay where such very high feeding is the practice as is followed at Tiptree, unless it be in the case of the best bred animals, which we have never seen there. Profit is to be made in the manufacture of beef and mutton, just by accommodating the management to the style of animal in the stalls or feeding boxes. And to assert of any experience, especially of so exceptional a one as that exhibited at Tiptree, that it represents the average experience of the country, is certain to mislead.

Mr. MECHI's agitation of this point, as of the others—liquid manuring—draining—farm buildings—hedgerow timber, &c,—on many of which his influence has been most beneficial—will be sure to do good; but it will in this case result not in the copying of his example, but in the avoidance of those errors to which we believe his experience to be due.

IN another page we give a report of the discussion which followed the reading of Mr. MECHI's paper last week before the Society of Arts. We regret we have not room to give a similar report of the discussion on LAND DRAINAGE, which followed Mr. DENTON's paper on that subject before the London Farmers' Club. It must suffice us to refer generally to the character which it assumed, and to the remarks of one or two of the speakers who engaged in it. Mr. BAKER, of Writtle, had, we think, the greatest influence on the former, which, from the commencement, accordingly took the form of an answer to the question:—How can land be drained most cheaply? rather than to the more important question—How can it be drained most efficiently?

Mr. R. BAKER said there was one element which entered into the question before them that Mr. DENTON had not touched upon, but which was of great importance to the tenant occupier. He meant the economy of drainage. In his district, and he believed in most other districts, the whole expense of the drainage must be met by the farmers themselves, and frequently this was done under very disadvantageous circumstances, from the fact that they had no security on the land, being merely occupying tenants from year to year. The prevailing mode of letting lands had, therefore, induced the farmer to adopt the least expensive system for effecting its drainage; and if the work was well done, without regard to duration—that was to say, if it were efficient for the purposes of the occupying tenant, during the period he held the

land, that was all he would care to accomplish. He submitted, then, that some of the old methods of draining might in such cases be resorted to as beneficially for the time being as the most elaborate tile draining that could be adopted. He knew he was venturing upon tender ground, and that he should startle certain gentlemen present, when he said, that a drain cut to the depth of from 20 to 30 inches, filled up with a portion of wood and covered with straw, was a good and an effective one. He might be told by tile drainers that it was impossible to attain the object desired by such a drain; but he was willing to put in competition with any pipe drainage in the country portions of the county of Essex, which have been drained after this manner, at a cost of only 40s. an acre; and where the land was as effectually drained as it was possible to be by any of the more expensive processes. Where the draining according to this system was well executed, it was generally found to last the duration of a lease of 14 years, and upon the wet chalky clays 21 years.

This, accordingly, was the real question under discussion:—How the best result can be attained by the use of existing means and under given circumstances? And there is no doubt that it is a very important question; and practically the only question which every tenant farmer asks himself upon the subject. It is not, however, the question of greatest importance, because it is of far greater moment that sound principles should be established and accepted—which should then be influential everywhere, as far as possible—than that the conduct proper in any particular case should be specified and defended.

Accordingly those who advocate the shallow drainage of clay lands, and the cheaper methods of proceeding (provided they were attended with a profitable degree of efficiency), carried the meeting with them throughout; and though the Farmers' Club did not commit themselves to any definite resolution, yet, had expression been given to their conclusions on the subject, there is little doubt that those who advocate the deep drainage of stiff clays would have been outvoted.

The general opinion seemed very well represented when Mr. Walton, in his very excellent and well-toned address, declared that, give him 20 inches of good dry soil, and he "cared not though the Hellespont ran beneath it." Now, this represents the whole matter in dispute. We quite agree with Mr. Walton; but it is because we cannot have 20 inches of dry soil over standing water that we contend for those deep drains by which the water level is put low enough to ensure sufficient depth through which rain water shall percolate with facility. We could have wished that the advocates of this deeper drainage had been present in larger numbers, and that their views had been more fully represented in the discussion. In Mr. Denton's paper they were, however, amply represented; and its publication, which we hope soon to announce, will go far to correct any such evils as are likely to arise from an exclusive attention to what is expedient rather that to what is most efficient in this matter.

The half-yearly meetings of the Agricultural Societies of England and Ireland have just been held. The report of the former is given in another page; for that of the latter we have not at present room, but we refer to it here in order to notice the discussion which ensued upon the motion that it should be received and adopted. An amendment to this motion was carried—resolving that a certain portion of it should be excepted from the general confirmation which was sought. It appears that the secretary, to whose energy we cannot but think very much of the increased prosperity of the Society is due, has failed—no extraordinary thing—to secure the cordial sympathy and good will of all with whom he works; and this outstanding minority, it seems, thought proper—at a meeting of three!—to pass a rule requiring that—

"In future an attendance book be kept, in which the secretary and accountant shall enter the hours of their arrival and departure; and should either of them find it necessary to leave the house, he will, on his return, state how long he has been absent, and the cause, under the head of 'Observation.'"

This, which was regarded as a personal indignity offered to Mr. Harkness, that gentleman—considering that the status of secretary to such an influential and national society was a position which ought not to be degraded in his person—refused to obey; and his presence was accordingly dispensed with at the meetings of the council, until a general meeting of the Society should decide the matter in dispute. The decision is in these terms:—"that the report be confirmed, except that part relating to the regulation of the 31st of October, 1854; and that while, on the one hand, we consider the managing committee to have, in this instance, exceeded their powers, on the other hand, we cannot but censure the conduct of the secretary in not obeying the orders both of the committee and of the council."

Now, this appears to be a fair and conclusive determination of a dispute which we have no wish to revive; and yet the status of the office bearers in our great national agricultural societies is a matter of sufficiently general and public interest to justify us in pointing out in what respect it appears to us to be deficient.

It asserts that the managing committee exceeded their powers in the rule which they passed; it ought, we think, to have expressed an opinion, not merely on the legality of the rule in question, but also on its character. In the able defence which Mr. Harkness and others made of the office which he holds, and the position which its occupant should maintain, evidence from all the national agricultural societies in the country was brought forward to prove what, without it, any man of judgment or of gentlemanly feeling might have known, that this rule imposed upon the secretary was enforced in no other case, and could not be, except with the certain degradation of the office, and, therefore, the inefficient discharge of its duties. What a society of this kind aims at is incapable of attainment, except through the agency of men of resolute, energetic, and high minded spirit; and whether such an one is likely to submit to conditions imposed only on menials or on weekly servants let any one decide.

One of the gentlemen concerned in the passing of this rule seemed annoyed at the course which had been taken, by which all "their little acts" had been exposed to public view. It seems plain to us, however, that the conduct of a public body, and of those responsible for its actions, is properly public property: and a national agricultural society, whether strictly public or not, ought certainly to aim at being so; cordially accepting the disagreeableness, or rather, let us say, the advantages, of public criticism, along with the increased usefulness which such a course ensures.

THE MIDLAND COUNTIES CATTLE SHOW.

Bingley Hall has been this week crowded by the large number of visitors who have been attracted by the Birmingham Exhibition of fat Cattle and Poultry.

The show was the best that has yet been held—not quite so great in number, either in cattle or poultry, as those of previous years, but quite as high in quality. The entries of cattle are some eight or ten under those of 1853; and those of poultry—owing to the higher entrance fee demanded—are also somewhat under the number shown last year; but here, too, the excellence of the birds exhibited, especially in Spanish and in Dorking classes, is unrivalled; and the Cochins, which have lost their extraordinary reputation, were never worthier of it than, according to their standing at the show this week, they are at present. The awards in cattle, sheep, and pigs, are given below; those of poultry we have not room to give in detail, but we shall name the winners in the principal classes.

As regards the cattle, it will be seen that several of the prize animals at the Smithfield Show appear again as winners. Mr. Towneley's extraordinary cow is the best short-horn in the yard here, as she was in Baker Street, but the gold medal for the best cow in the yard, irrespectively of breed, is given to a Hereford exhibited by Mr. Stedman, of Ludlow. We know that this was not a unanimous decision of the judges, and we believe that the majority of those who examined the two with any care, even in the neighbourhood of Herefordshire, will feel with the protesting judge that the judgment is mistaken. The Hereford is neither so level in the back, so wide at the hocks, so broad in the bosom, nor so good in the flank and thighs as the short-horn cow. The former is more smoothly and evenly covered, and thicker in fat probably along the back; but she has drooping rumps, smaller girth, and is altogether not nearly so even and well made a beast. She is, however, an extraordinary animal, and her age—4 years and 10 months—is less than that of the short-horn cow. We have her dimensions, and those of every other animal in the Hall, and as soon as we have their carcase weights we shall compare them for the information of our readers. We may refer here to an extraordinary short-horn cow shown in the extra class by Mr. Wilson, of Brawith. This cow had been successful at Norwich, and had once (or twice) won the challenge cup in Ireland. She is now at an early age to be slaughtered by the butcher, another victim, we cannot but think, to the system of over-feeding breeding stock for exhibition.

Probably the next most extraordinary animal in the yard was a heifer shown by Mr. Heath, of Ludham Hall, Norwich, the same age as the prize cow—a somewhat smaller animal in frame, but even more thickly covered, and covered evenly. There was no unsightly excrescence, such as is sometimes seen, but an extraordinary thickness of flesh over back, ribs, loin, and rump, which made her, in our opinion, an even nearer competitor with Mr. Towneley's cow than its more successful rival. She is an animal of fidgetty temper, which is a rare thing in the case of so successful a feeder.

Among Short-horns Mr. Stratton, of Swindon, is here a successful exhibitor, although beaten at the Smithfield show; and Mr. Towneley, as we have said, carries off the first prize with the cow "Alice;" Mr. Langston taking the second with a remarkably well-grown and well-fed cow, which was also successful at Baker Street. The Devon classes are not equal in merit to the show of the same kind last week in town. Mr. Burbery, of Wroxhall, takes the prize for Long-horns, which, as might be expected from their neighbourhood to their proper county, were a better show of animals than appeared at Baker Street. It is obvious, however, that except as milkers their merits are far surpassed by any of the three standard breeds of cattle.

There was a better show of sheep than we have yet seen in Bingley Hall, and the Shropshire Down came out in great force, and with some success. We have not space for a detailed examination of the pens. The pigs have hitherto been one of the principal features in the exhibition; and although the other classes have improved more rapidly in quality and importance, they still command a large share of attention. We do not think they are quite equal in merit to former years. The classes of large pigs may perhaps be excepted from this remark, as a considerable number of pens of very useful, even, and well sorted animals were shown. Some of them, we notice, were disqualified by Prof. Simonds and his colleagues on the score of age. Two pens shown by his Grace the Duke of Sutherland were thus thrown out; and we shall no doubt, therefore, have the history of these animals fully investigated, and the trustworthiness of the professor's tests of age determined.

AWARD OF PRIZES.

Class I. Hereford Oxen or Steers.—1st, 10*l.*, and G. M., Mr. W. Heath, Ludham Hall, Norwich. 2d, 5*l.*, Earl of Warwick, Warwick Castle.

Class II. Hereford Steers.—1st, 10*l.*, H.R.H. Prince Albert, Windsor Castle. 2d, 5*l.*, Mr. I. Niblett, Filton, Gloucestershire.

Class III. Hereford Cows.—1st, 10*l.* and G. M., Mr. W. Stedman, Bedstone Hall, near Ludlow. 2d, 5*l.*, Mr. W. Cother, Middle Aston, near Woodstock.

Class IV. Hereford Heifers.—1st, 10*l.*, Mr. W. Heath, Ludham Hall. 2d, 5*l.*, Mr. W. Hall, Ashton, near Leominster.

Class V. Short-horn Oxen or Steers.—1st, 10*l.*, and S. M., Mr R. Stratton, Broad Hinton, near Swindon. 2d, 5*l.*, Mr. J. H. Lees, Bacon's End, Coleshill.

Class VI. Short-horn Steers.—1st, 10*l.* and S. M., Mr. L. Cowley, Ashby St. Ledger's, Daventry. 2d, 5*l.*, C. Barnett, Esq., Stratton Park, Biggleswade.

Class VII. Short-horn Cows.—1st, 10*l.*, C. Towneley, Esq., Towneley Park, Burnley. 2d, 5*l.*, J. H. Langston, Esq., M.P., Sarsden House, near Chipping Norton.

Class VIII. Short-horn Heifers.—1st, 10*l.*, Mr. J. Phillips, Ardington, near Wantage. 2d, 5*l.*, Mr. W. Fletcher, near Mansfield, Notts.

DEVONS.

Class IX. Devon Oxen or Steers.—1st, 10*l.*, and S. M., Earl of Leicester, Holkham, Norfolk. 2d, 5*l.*, Earl of Leicester.

Class X. Devon Steers.—1st, 10*l.*, H.R.H. Prince Albert Windsor Castle. 2d, 5*l.*, Earl of Leicester, Holkham.

Class XI. Devon Cows.—1st, 10*l.*, Earl of Leicester, Holkham.

Class XII. Devon Heifers.—1st, 10*l.*, H.R.H. Prince Albert, Windsor Castle. 2d, 5*l.*, Mr. W. Heath, Ludham Hall, Norwich.

Class XIII. Long-horn Cows or Heifers.—1st, 10*l.*, and S. M., Mr. S. Burbery, Wroxhall, near Warwick. 2d, 5*l.*, Mr. S. Burbery, Wroxhall.

OTHER BREEDS.

Class XIV. Fat Oxen or Steers.—1st, 10*l.*, Mr. R. Hawkes, Hunscote, near Wellesbourne, Warwickshire. 2d, 5*l.*, Mr. P. F. Hussey, Wyrley Grove, Walsall.

Class XV. Fat Cows.—1st, 10*l.*, and S. M., Mr. R. Timms, Branston, near Daventry. 2d, 5*l.*, Mr. W. Bodington, Montagu House, Kenilworth.

Class XVI. Fat Heifers.—1st, 10*l.*, Mr. J. Stewart, New Market, Aberdeen. 2d, 5*l.*, Mr. J. Lawrance, Cawston, Rugby.

Class XVII. Scotch or Welsh Oxen or Steers.—1st, 10*l.*, R. Sneyd, Esq., Keele Hall, Staffordshire. 2d, 5*l.*, the Duke of Beaufort, Badminton, Gloucestershire.

Class XVIII. Scotch or Welsh Heifers.—5*l.*, Mr. R. Thomas, Ryton, Shiffnal.

EXTRA CLASSES.

Class XX. Cows or Heifers.—S. M., Mr. B. Wilson, Brawith, Thirsk.

SHEEP.

Class XXI. Leicesters. Fat Wethers, not exceeding 22 months old.—1st, 10*l.*, and S. M., G. S. Foljambe, Esq., Osberton Hall, near Worksop. 2d, 5*l.*, the Marquis of Exeter, Burghley Park, near Stamford.

Class XXIII. Long-woolled Sheep, not being Leicesters.—Fat Wethers, not exceeding 22 months old.—1st, 10*l.*, Mr. W. Slatter, Stratton, Gloucestershire. 2d, 5*l.*, Mr. W. Hewer, Highworth, Wiltshire.

Class XXIV. Long-woolled Sheep, not being Leicesters.—Fat Wethers, exceeding 22 but not exceeding 34 months old. 1st, 10*l.*, Mr. T. Walker, Newbold, near Rugby. 2d, 5*l.*, Mr. T. Walker, Newbold.

Class XXV. South and other Down Sheep.—Fat Wethers, not exceeding 22 months old. 1st, 10*l.*, Mr. J. Williams, Buckland, Berkshire. 2d, 5*l.*, Lord Walsingham, Merton Hall, near Thetford, Norfolk.

Class XXVI. South and other Down Sheep.—Fat Wethers. exceeding 22 but not exceeding 34 months old. 1st, 10*l.*, and S. M., Sir R. Throckmorton, Bart., Buckland, Berkshire. 2d, 5*l.*, Lord Walsingham, Merton Hall, near Thetford.

Class XXVII. Shropshire, and other Black or Grey-faced Short-woolled Sheep.—Fat Wethers, not exceeding 22 months old. 1st, 10*l.*, T. C. Whitmore, Esq., Apley, Salop. 2d, 5*l.*, Mr. S. Matthews, Montford, Shrewsbury.

Class XXVIII. Shropshire, and other Black or Grey-faced Short-woolled Sheep.—Fat Wethers, exceeding 22 but not exceeding 34 months old. 1st, 10*l.*, Mr. W. Foster, Kinver Hill Farm, near Stourbridge. 2d, 5*l.*, the Earl of Aylesford, Packington, near Coventry.

Class XXIX. Cross-bred Sheep.—Fat Wethers, not exceeding 22 months old. 1st, 10*l.*, and S. M., Mr. A. C. Keep, Wollaston, Northamptonshire. 2d, 5*l.*, Mr. W. Gillett, Southleigh, Oxfordshire.

PIGS.

Class XXXI.—Fat Pigs of one litter, not exceeding 10 months old. 1st, 10*l.*, H. R. H. Prince Albert. 2d, 5*l.*, Mr. J. Wyley, jun., Longdon, Rugeley, Staffordshire.

Class XXXII.—Fat Pigs of one litter, not exceeding 15 months old. 1st, 10*l.*, H. R. H. Prince Albert. 2d, 5*l.*, Mr. J. Wyley, jun., Longdon, Rugeley, Staffordshire.

Class XXXIII.—Fat Pigs, exceeding 15 months old. 1st, 6*l.*, J. Baldwin, Esq., King's Norton, Worcestershire. 2d, 3*l.*, J. Baldwin, Esq., King's Norton.

BREEDING PIGS.

Class XXXIV.—Pigs of a large breed.—Five Pigs of one litter, exceeding 3 and not exceeding 6 months old. 1st, 10*l.*, Mr. W. J. Sadler, Bentham Purton, Swindon, Wiltshire. 2d, 5*l.*, Mr. W. Hewer, Sevenhampton, Highworth, Wiltshire.

Class XXXV.—Pigs of a small breed.—Five Pigs of one litter, exceeding 3 and not exceeding 6 months old. 1st, 10*l.*, R. H. Watson, Esq., Bolton Park, near Wigton, Cumberland. 2d, 5*l.*, Mr. J. Alderson, Thornby, Aikton, Cumberland.

JUDGES OF CATTLE.

Mr. John Booth, Killerby, Catterick, Yorkshire; Mr. Philip Halse, Molland, near South Moulton, Devon; and Mr. Henry Chamberlin, Desford, near Leicester.

JUDGES OF SHEEP AND PIGS.

Mr. Valentine Barford, Foscote, near Towcester; Mr. John Moon, Eggesford, near Chulmleigh, Devon; Mr. John Meire,

Newport, Salop; and Mr. Benjamin Swaffield, Pilsbury, near Ashbourne.

THE POULTRY show is, after all, at Birmingham, the great feature of the Midland Counties Exhibition. The classes most notable for merit are the Dorkings, Spanish, Cochins, and Game. The Polands too, and some of the classes of Hamburghs are of extraordinary merit. The Silver Spangled Hamburghs are awarded a general certificate of excellence by the judges; and the class of coloured Dorkings for chickens of 1854 is spoken of as being the whole class very meritorious and deserving of the highest commendation.

There was an extraordinary show of ducks and geese; the former especially being excellent. In this, as in the other classes, the office of judge being one of very great difficulty. Classes are not now, as formerly, easily divisible into the deserving and undeserving: every bird needs careful examination, in order to its being justly placed. We may mention as receiving first prizes in the Hamburgh class, Mr. W. C. Worrall, Rice House, Knotty Ash, Liverpool; Mr. W. Tyler, Friday Bridge, Birmingham; Mr. Joseph Conyers, 42, Boar Lane, Leeds; Mr. C. S. Dixon, Sun Bridge, Bradford, Yorkshire; Mr. John Andrew, Waterhouses, near Ashton-under-Lyne; the Rev. F. Cartwright, Oakley, Thame; Mr. Josiah B. Chune, Coalbrookdale.

The following are the leading prize-men in the classes of Polish Fowl:—Mr. T. P. Edwards, Railway Station, Lyndhurst, Hampshire; Mr. E. B. Guest, Ivy House, Broadwas, Worcestershire; Mr. Joseph Conyers, 42, Boar Lane, Leeds; Mrs. Mills, Bisterne, near Ringwood, Hampshire; Mr. George C. Adkins; Mr. P. Jones, High Street, Fulham, London; Miss Vivian, Singleton, Glamorganshire.

The first prizes to the classes of Spanish Fowls were awarded as follows:—Mrs. Stow, Breedon, near Tewkesbury; Mr. Joseph Rake, Bristol.

Among Dorkings the first prizes were received by Mr. Henry Smith, The Grove, Cropwell Butler, near Bingham; Mrs. Jennens, Mosely, near Birmingham; Francis J. Coleridge, Esq., Ottery St. Mary, Devonshire.

Among the Cochin China classes, the prize birds first in each class had been contributed by the following exhibitors:—Mr. Thomas Burnett, Hutton, near Preston, Lancashire; Mr. Charles Punchard, Blunt's Hall, Haverhill, Suffolk; the Rev. Grenville F. Hodson, Banwell, Somersetshire; Mr. Cyrus Clark, Street, near Glastonbury; Mr. James Turner, Northbrook, near Exeter; Mr. Charles Thomas Nelson, The Lozells, near Birmingham; Mr. Thomas Smith, Stableford, near Bridgnorth.

We have not space for a more detailed report, either of the awards or of the birds. But we must not conclude without noticing the extraordinary show of vegetable produce exhibited by Messrs. Burbidge, of Birmingham, and Dickson and Chivas of Chester. Very splendid specimens of the Drumhead Cabbage, of Swedes, Mangold Wurzel, and Carrots, besides collections of Wheats and Grasses, were appropriately rewarded with Silver Medals by the judges.

Home Correspondence.

Wages in Canada.—The subjoined letter I received from a gentleman in Upper Canada; perhaps in publishing it you might enforce the necessity of providing our labouring classes with more comfortable dwellings, with some little ground, sufficient to make them feel an interest in their father-land. *Thomas Sibbald, Axmouth.*

"Sutton Georgine, Canada West.

"Dear Sir,—I have to acknowledge the receipt of your letter, requesting information what openings there might be at this village for labourers and mechanics; with regard to such tradesmen as bricklayers, blacksmiths, and carpenters, &c., I have to state that this summer their wages were from 7*s.* 6*d.* to 12*s.* 6*d.* per day, and very difficult to get at those wages. Good millers are much wanted; ours get 100*l.* a-year. Labourers' wages are from 2*l.* 10*s.* to 3*l.* 10*s.* a month, with board and lodging, and employment for any number. I have also to observe that there is a capital opening for a medical man of good talent. I can with truth hold out every inducement to agricultural labourers; they can, if they are sober, industrious people, secure to themselves a comfortable home. Were I to enumerate all the men of this class who have purchased farms for themselves out of their wages in this immediate neighbourhood, and who came to this country without any means whatever, I might fill volumes."

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

THE half-yearly meeting of the members of the Royal Agricultural Society was held at their rooms in Hanover Square on Saturday, W. MILES, Esq., M.P., president of the Society, in the chair. There were present the Earl of Feversham, Sir John Shelley, M.P., Colonel Challoner, Mr. Raymond Barker, Mr. Barthrop (Suffolk), Mr. Astbury (London), Mr. Wassop (Huntingdon), Mr. R. W. Baker (Rutland), Mr. Dyer, Professors Simonds and Way, Mr. Joseph Davies (Oxfordshire), &c.

The Secretary (Mr. Hudson) read the following report:—

The Council have to report, that since the last General Meeting in May, the Society has lost 45 of its members by death or otherwise, while 135 new members have during the same period been elected on its list, which now contains 89 life governors, 145 annual governors, 778 life members, 4236 annual members, and 19 honorary members. The vacancy in the Council created by the death of Mr. French Burke has been filled up by the appointment of the Earl of Dunraven. In consequence of the losses incurred by the meeting at Lewes, and by the non-payment of subscriptions due, the Council have found it necessary to sell out of the funds the sum of 1500*l.*, thereby reducing the amount of funded property to 9264*l.* When all the outstanding claims of the Society, which by inattention have not yet been sent in, are paid, a fair balance will remain in the hands of the bankers. The whole of the second part of the Journal for the current year is now in type, and in the course of being printed for distribution among the members. It will contain, among other papers, two lectures delivered before the Society by Professor Simonds, on the Age of Animals as indicated by their Teeth; and Professor Way's lecture on the Agricultural Action of Lime. The Council have agreed to the following schedule for the prize essays to be sent in for competition to the secretary by the 1st of March next:—

Farming of Warwickshire	£50	0	0
Farming of Buckinghamshire	50	0	0
Chemical changes in the fermentation of dung	30	0	0
Artificial manures, and principles of their application	20	0	0
Artificial feeding stuffs	20	0	0
Causes of fertility and barrenness in soils ...	40	0	0
Retention of moisture in dry Turnip land ...	10	0	0
Prevention and cure of mildew in cereal crops	20	0	0
Lameness in sheep and lambs	20	0	0
Any other agricultural subject	10	0	0
	£270	0	0

The country meeting at Lincoln has proved in every respect to have been one of the most successful hitherto held by the Society. The cordial greeting and hospitality the members received, the liberality of the mayor, and the co-operation of the local committee, alike contributed to promote most effectively the objects of the Society on that occasion; while the special prizes offered by the Mayor to the owners of hunting horses and to the breeders of improved Lincoln sheep, and those for long wool offered by the local committee, increased the variety of the show. A peculiar international interest was at the same time given to the proceedings by the presence of a body of gentlemen deputed specially to attend the meeting by his Majesty the Emperor of the French, as a mark of his respect towards the Society and the agriculturists of the kingdom. The trials of implements on that occasion were conducted with great care, and with strict attention to results. In the testing of power, two important inventions were introduced, which still further promoted that highly important object, viz.—1. Mr. Amos's improved dynamometer, for self-registering, at one and the same time, the power and velocity required in working the various classes of machines exhibited; and 2. Mr. Balke's employment of a vibrating pendulum, to supersede certain personal superintendence required previously in the trial of steam engines. The Society have been indebted to Mr. Amos and the Messrs. Ransomes and Simms respectively for the use of these instruments at the Lincoln trials. The Council have accepted the invitation of the authorities of Carlisle to hold the Society's country meeting of 1855 in that city; and measures have already been taken for preparing the land for the trial of implements and for the purposes of the show-yard. The Council have agreed to the following schedule of prizes to be awarded at that meeting in the classes of cattle, horses, sheep, and pigs, viz.:—

Short-horned cattle	£160	0	0
Hereford cattle	160	0	0
Devon cattle...	160	0	0
Scotch cattle	105	0	0
Agricultural horses, generally	150	0	0
Clydesdale horses	50	0	0
Leicester sheep	110	0	0
Southdown and other short-woolled sheep ..	110	0	0
Long-woolled sheep, not Leicesters... ...	110	0	0
Mountain sheep	40	0	0
Pigs	70	0	0
Total	£1225	0	0

They have postponed to their first meeting in February the consideration of the question of prizes for farm poultry, and their decisions on those for agricultural implements and machinery. The Council continue to be favoured by the Earl of Clarendon with returns furnished by the English Ministers and Consuls of the existence of guano or nitrates within their respective jurisdictions. The noble lord has likewise intimated that special instructions have been given by the Admiralty for investigations to be made by cruisers in tropical seas in cases where a probability of success is indicated by collateral circumstances. These various communications will eventually form a body of valuable evidence for the Society; and the Council cannot too strongly express their deep sense of Lord Clarendon's great interest in promoting the objects of the Society. The French Government have transmitted to the Society, through the Minister of Agriculture and Commerce in Paris, a valuable collection of the most important agricultural works recently published in France; intimating that all requests from the Society for any information from France will be complied with. The Council, in acknowledging this mark of distinguished consideration on the part of the French Government, have availed themselves of the opportunity of transmitting a complete set of the Society's *Journal* for their acceptance. The constant influx of new members from every part of the kingdom affords presumption of the public usefulness of the Society, and of the advantages derived from a national institution which, uniting in itself so large a proportion of the agricultural community dispersed throughout the country, becomes a powerful engine for carrying into effective action and practical operation those improvements or alterations which, while tending to advance individual interests, promote the general welfare of the nation.—By order of the Council,

JAMES HUDSON, Secretary.

The Earl of Feversham moved that the report just read be received and adopted.

Mr. R. W. Baker seconded the motion, which was agreed to.

Mr. Raymond Barker (as chairman of the Finance Committee) then read a statement of accounts for the past half-year, from which it appeared that the receipts for that period amounted to 4696*l.* Acting under the power deputed to them 12 months ago, the Finance Committee had, to meet the necessities of the case, sold out 1500*l.* of funded stock, and at the November meeting of the Council he was authorised to address a simple statement of the position of the Society to such of the members as were in arrear with their subscriptions, and having submitted that statement to them, he would do them the justice of saying that most of them had promptly responded to the appeal. The result was, that at the present moment they had a balance at the bankers' (about 1000*l.*) upon which no claim could be made, except an unsettled account for unavoidable repairs to the Society's premises during the last winter. Sir J. Shelley moved a vote of thanks to the auditors, and explained that the Finance Committee had been driven to a sale of funded stock in consequence of the Lewes Show having been held in the midst of the general election of 1852, by reason of which a considerable falling off was experienced in the receipts at the show-yard. Mr. Astbury seconded the motion, and it was agreed to.

On the motion of Mr. Joseph Druce, seconded by Mr. Warsop, the auditors were re-elected.

Colonel Challoner proposed a vote of thanks to Professor Way for his chemical lectures during the past half-year, and the services he had rendered to agriculture by his researches and experiments. Through the assistance of the learned Professor the Society had been enabled to accomplish one of the most useful results that could have been secured to the farmer—he meant the providing of facilities for detecting the adulteration of guano and other artificial manures. That was a matter of paramount importance to the agriculturist; for if a man went into the market and had to pay 12*l.* a ton for an article that was not intrinsically worth 2*l.*, it was nothing else than a wholesale robbery, as well as possibly causing a serious detriment to the land. Professor Way had honestly prosecuted his researches, and shown where the shoals lay, upon which if the farmer were wrecked, it would be his own fault, and not the fault of this Society or of the Professor.—Mr. Barthrop seconded the motion, which was agreed to, the President adding his own thanks to those of the meeting.

Professor Way was exceedingly glad to receive this public testimony of the interest the Society took in his researches and lectures. Colonel Challoner had referred to the subject of manures—a matter which came home to the farmer nearer, perhaps, at this moment than at any other; but he hoped that, after a time, such a feeling would be produced amongst the manure-makers that adulteration would be impossible, which meant that by keeping the cat active they would no longer have mice to kill. (A laugh.) He was happy to add, that a better class of persons were now going into the manure trade, and by and by he had no doubt they would find in every locality respectable and trustworthy men engaging in it, thus relieving the farmer from the necessity of having recourse to chemical experiments for testing the quality of the manure he purchased.

On the motion of Mr. Barker, seconded by Colonel Challoner, a vote of thanks was also passed to Prof. Simonds, who acknowledged the compliment.

Sir J. Shelley proposed, and the Earl of Feversham seconded, a vote of thanks to the president, which was adopted with applause.

The President, in acknowledgment of the compliment, said it had always given him pleasure to labour for the society because it commenced on a sound basis—not taking science alone for its guide, but practice and science combined.

The meeting then separated.

SOCIETY OF ARTS, *December* 6.—*On British Agriculture.*—The following is an abridged report from the Journal of the Society of the discussion that followed the reading of Mr. Mechi's paper:—Mr. Samuel Sidney said, as he had made it his business for some years past to visit and gather the opinions of the best farmers in almost every county from Yorkshire to Devonshire, he should venture, in the most friendly spirit, to criticise Mr. Mechi's statements and opinions. He never had been a political opponent of Mr. Mechi—he agreed with the principles that he laid down, although, fortified by the experience of the first farmers of the day, he dissented from his agricultural recommendations. Mr. Mechi had not done justice to the improving spirit of the farmers of England. By his silence, in a paper on "British Agriculture," as to all doings except his own, he had led that *un*agricultural assembly to believe that an improving agriculture was only to be found in his little farm in Essex. This was not the case. There was no doubt that well drained land—appropriate farm buildings—the best implements the agricultural mechanic could produce—a steam-engine, fixed or locomotive—stock of good quality—the use of artificial manures and artificial food, were essential to developing to the utmost the food producing capabilities of the kingdom. This every modern farmer acknowledged. Why, as to drainage, it was no new thing; it had been practised in Essex and Norfolk years ago, as could be confirmed by a Norfolk farmer now at his side, of 40 years experience. For many years the Journal of the Royal Agricultural Society, and the discussions at farmers' clubs had been directed to the subject; and wherever he went, whether for farming or for hunting, he found the ground drained, or in process of being drained, by landowners and tenants, without reference to proceedings at Tiptree. The same remark applied to farm buildings.—In Lincolnshire, in Norfolk, in Bedfordshire, and in Essex, excellent farm buildings had long existed. But none of these buildings were on the model, or planned on the principles, of Mr. Mechi's. As to steam-engines, they were not new; in Scotland they were as common as barns; and long before Mr. Mechi erected his, their construction was an established branch of trade with half-a-dozen agricultural implement makers. The enormous, the constantly increasing demand for the most improved implements by real farmers, showed that our agriculturists were awake and up to the spirit of the times. As to stock, he preferred Mr. Mechi's advice to his example. He had seen his stock, and compared it with that he saw tied up feeding on Lincolnshire and Bedfordshire farms, and he must say the comparison was not to the advantage of Mr. Mechi's system. They had heard something of the amount of meat sold off Mr. Mechi's farm; why, he could tell those who now looked into farming details for the first time, of Mr. Hudson's farm of 2000 acres, where, besides enormous corn crops, he sent off to the London market 10 fat bullocks and from 200 to 250 fat sheep every week, from January to July, where the bill for oil-cake was 600*l.* or more, and this on the same farm which in 1822 would only carry in the year 200 beasts and 250 sheep. The owner of that farm had

been farming more than 30 years, and had been improving every year of that time. He could tell them, too, of a farm in Bedfordshire where on no remarkable soil 1000 sheep and lambs and 150 bullocks were sent off to market out of 900 acres; and these were specimens of modern and successful farming principles, which for many years had been making constantly increasing progress without any reference or benefit from the little farm in Essex. It was unfair to compare farmers to shopkeepers and manufacturers. The profits of a farmer were limited to one return in the year,—his occupation required his personal attention. In an hour the inhabitants of a town could receive all the advantages of such meetings as those of the Society of Arts. The farmer, from his local position, was deprived of the same benefit of discussion, comparison, and competition to be obtained by a town population. The value of land must always be limited by the extent of its markets. But he maintained confidently that the progress of agriculture had kept pace with the improved means of communication. On Mr. Mechi's balance-sheet he did not mean to make any remarks, although on a fitting occasion it might give rise to many inquiries. He hoped that Mr. Mechi would every year report to that Society the results of his many experiments, and give it the benefit of his shrewd and wily observations. But a balance-sheet, whether of a farm or a railway, was not the sort of thing to be discussed with any advantage by a public meeting. Mr. Mechi had been very unfairly worried into producing it, but he might now with a good grace discontinue it; especially as a favourable or unfavourable balance proved nothing on an experimental farm. At present prices every kind of industrious cultivation paid, or ought to pay. In conclusion, he would say a few words on the only subjects in Mr. Mechi's paper which raised any disputed points—steam digging and liquid *versus* solid manure.

Steam digging might be dismissed in a sentence—it had nothing to do with British agriculture—it was a mere theory, very proper for the investigation of mechanics, but no working digger had yet been produced. So far the plough was the best instrument, and the efforts of agricultural reformers would be most usefully directed to inducing our farmers in dark districts to adopt the improved iron ploughs of Howard and Ransome, instead of their clumsy wooden affairs, without waiting for the invention of a steam digger. As to the liquid manure, there were, no doubt, circumstances under which it might be used with great advantage, but the balance of evidence was against its exclusive employment for every kind of crop. The use of it was twofold—mechanical and chemical. Solid long straw manure was invaluable as a disintegrator of heavy clays. It had another advantage: when once laid in the soil, the labour was done; thenceforth it gradually and surely gave forth its fertility to every crop. But the crops of a farm were, at any rate, of three kinds: root crops, corn crops, and Grass crops. The whole balance of experiments tried in every part of England showed that liquid manure was not more advantageous or economical, and sometimes positively injurious to root crops. To corn crops it was positively injurious, stimulating the straw at the expense of the ear, and washing away the soil from the roots. On Grass crops the results, when applied in sufficient quantities, and at proper times, were very satisfactory, especially on the perennial Italian Rye-grass. It would depend on circumstances whether green crops should be the chief object of cultivation. But, at any rate, young farmers must pause before they altered the whole economy of their farm, went to enormous expense in iron pipes, hose, labourers, and coal for pumping, and incurred the difficulty of building great tanks for a manure available for only one kind of crop. At present the whole current of opinion was towards covered homesteads and feeding in boxes, for the purpose of producing solid concentrated manure. That plan was rapidly superseding open yards, and that was the very reverse of tanks, pipes, pumps, and squirts. The most effectual application of liquid manure he had ever seen was in the Water Meadows of Exmoor, where a stream, carried through the farm-yard of Mr. Robert Smith, was impregnated with a dung-heap, and on rainy days 80 acres were flooded in an hour. By this means land not worth 2*s.* was made worth 40*s.* a year; but that depended on local peculiarities, as to form of land and flow of water. He (Mr. Sidney) deprecated the hasty adoption of the enormous expenses attendant on applying liquid manure to farms where dairy produce was not the principal object. As to town sewage, that was quite a different question; it would, he hoped, be shortly discussed separately at the Society of Arts. He would not enter into any elaborate details as to the sewage question, which had been exhausted in a recent paper by Mr. Way, the consulting chemist of the Royal Agricultural Society. Sewage manure was not night-soil; it was a very weak solution, the solid matter floating in 1400 times its weight of water. Night-soil was largely used by our market-gardeners, who brought it back from towns in their carts when they sold their vegetables. London manure could be sent down the Medway to Kent for 1*s.* 6*d.* a ton. But the Chinese plan of collecting soil from house to house would not pay here. There wages were a penny, here they were 3*s.* a day. For his part he said, let those who could use town sewage and night-soil; but do not let the towns wait for a profit from nuisances, when farmers can more cheaply send thousands of miles for guano. In conclusion, he begged to thank Mr. Mechi for having opened so important a subject as British agriculture, and to recommend those who were inclined to commence the study not to be satisfied with books and lectures, but to visit our best counties. From long acquaintance with farmers he would promise them a hospitable reception from a body of men not inferior, having regard to their opportunities, in intelligence and enterprise to any class of men in the kingdom.

Mr. Oakley thought the farmers of this country had a great deal to thank Mr. Mechi for—not only for the good he had accomplished, and the money he had spent in effecting improvements, but also for having pointed out to the agriculturist the shoals and breakers which he should steer clear of. As far as his own experience went, he would say the best economy of manure, and the cheapest way to make it available and profitable was to make it under cover, and to keep the rain of heaven from it, in order that the real manure might go into the land in that state; and if that was done, the manure so used had been proved to have a stronger fertilising power than manure made in the open air. Believing that to be the case, he had adopted the system of box feeding, which he first saw in practice on the farm of Mr. Beadel, in Essex. He saw the system in operation there, and took an opportunity to introduce what he considered some improvements, and those persons who had adopted the plan had thanked him over and over again for having called their attention to it, and had acknowledged the great advantages resulting from it. He was happy to tell them that it had been proved beyond doubt that the same area of land, covered with buildings—be they stables, barns, cattle-sheds, or piggeries—could be closed under one roof at less expense than upon the old plan, leaving as much stable and yard room as under the old system. If that were so the landlord was benefited by the buildings costing him less; and he was, moreover, benefited, because the tenant would also thrive.

Mr. Davis gave the statistics of an experiment upon a small scale in Scotland. There were 15 acres of Italian Rye-grass sown in 1853, and 25 acres sown in 1854, also 15 acres of ordinary Grass. The latter was very badly treated, inasmuch as there was not a sufficiency of liquid manure either for that or the Italian Rye-grass, owing to the tanks not being completed, so as to save the sewage of the winter of 1853. The Italian Rye-grass of 1854 was sown between the 17th April and 1st of May, and yielded four good cuttings. There were also four cuttings from the ordinary Grass, and four from the Italian Rye-grass, sown in 1853. Upon these 55 acres of Grass there were put on, 8th of May, 1854, 25 cattle, all sold by the end of September; on the 18th of May, 20 cattle, and on the 22d of June, 11 cattle, all sold by the end of October; and 68 cattle, rising two-years old, which had been put out between the 26th of June and the 19th of July, were on hand at the end of October. He would mention that the cattle were fed in covered yards, and out of 124 cattle, 260 sheep, and 15 pigs, put on between the 24th of April and the 11th of October, not one case of death occurred. These 55 acres fed at the rate of two head of cattle and five sheep per acre, and that was in a poor county, where, in general, they would be glad to fatten one beast upon 2 or 3 acres of land. As to the profit, without laying a balance-sheet before them, he would give them the figures. The net profit, after deducting all expenses for labour, horse-work, interest on outlay for buildings and machinery, wear and tear, interest of money on stock, cost of cake and corn, and all other charges, was 4*l.* 6*s.* 10¾*d.* per acre, or, on 55 acres, 238*l.* 19*s.* 4*d.*; that was the result of the application of capital and skill upon very bad land. He had been induced to make this statement in consequence of what had been said as to there being no profit got out of feeding cattle upon Rye-grass. They need not go to foreign countries for guano, when they had enough at home of excellent quality if they would only put it upon their land, but as to watering-carts and hand-barrows they were child's play. It was like asking the cotton manufacturers to take up the distaff again. As Mr. Mechi has justly remarked, as long as they stayed at home hugging their own notions, they thought themselves very clever, but when they went abroad they very soon found there were others more clever than themselves. Why, a manufacturer in Manchester would not hesitate to go to Switzerland, if he found out that some one there could dye a cloth a better red than he could produce it, but it was difficult to get the farmer to go into the next town. No; he would stop at home—his father was a farmer before him, and therefore he ought to know a good deal about it.

Mr. James Caird thought there was no real difference between Mr. Mechi and Mr. Sidney. The latter gentleman had given a correct history of the improved methods of agriculture which were now in operation throughout the country; but Mr. Mechi had come forward to speak of his own experience, and not the experience of others. It was no slur upon that gentleman that he did not tell them what other eminent men had done. He would ask any practical man present whether the instance which Mr. Sidney had given of sending from a farm in Norfolk 10 fat bullocks and 250 fat sheep per week into the market was not an exception? Would any one say it was the rule? But the observations both of Mr. Sidney and Mr. Mechi tended to the same direction of progress, and they were equally indebted to both gentlemen for this expression of their opinion. With regard to liquid manure, he agreed with Mr. Sidney, it was a question of profit to each individual farmer. Some would doubtless find Mr. Mechi's plan most advantageous, whilst others, differently situated in matters which must come into the calculation, might find the application of solid manure the most advisable. It was a question which must be decided by the peculiarities of each case.

Mr. Morton said there were no two more important points in the whole range of agricultural subjects than the economy of labour, on the one hand, which Mr. Mechi touched upon when saying that one quarter of the arable produce of this country was consumed by farm horses; and, on the other, the profitableness of feeding stock, which he denied. Now he (Mr. Morton) was quite sure that the agricultural experience of the northern half of the island was against Mr. Mechi on both these points. Horses did not consume one-fourth of the arable produce of North Britain; nor were sheep and cattle necessary evils on the arable land of Scotland. They were necessary there as they were here; but they were profitable there, whether they were here or not. On the question of horse labour, he might say that there were, last year, on the 250,000 arable acres of Roxburghshire and Haddington, 9400 horses—a pair to every 54 acres; while over 1,630,000 arable acres of Norfolk and Hunts there were 73,000 horses, or a pair to every 44 acres. Now it did not need 5½ acres in the south of England to feed a horse, and he was quite sure it did not need 6¾ acres in the Lothians to feed a horse; and to say that the farm horse consumes a quarter of the food his labour produces was an exaggeration in both north and south, which he would be inclined to put at nearly once and a-half the truth in England, and as nearly twice the truth in Scotland. Then, as to the practice of feeding stock for the sake of the manure, he believed that his experience would pretty nearly bear out what Mr. Mechi said was his own; but, notwithstanding that, he should not venture to found upon it a general assertion, in the expectation that it would apply with truth to the whole of the country. He found that during four years, with 1500*l.* worth of stock a year, he sold more fat beef, mutton, and bacon, than he bought of cattle, sheep, and pigs, and food and attendance, by 160*l.* a year—this then was the sum he received for the green food, at least 1000 tons, which during each year they consumed—this was the sum out of which he had to pay the rent and cultivation of the 60 acres on which those 1000 tons were grown. Well, that was not a very paying concern, but still it was a little better than the loss of 64*l.* on 3600*l.* worth of stock and food, which was Mr. Mechi's position during this past year. In the former case, about 3*s.* 6*d* worth of meat was made by the consumption of a ton of green food, and of course green food could not be grown for 3*s.* 6*d.* per ton—not even on an ordinary Grass field, and still less in the Turnip field. But he believed, that when good judgment guided the purchaser or the breeder, and skilful management conducted the feeding process, that you might calculate on 1 lb. of meat for every 175 to 200 lbs. of English grown Turnips; and he believed you might expect one-third to one-half more from the consumption of Scotch grown Turnips—there was all that difference in the feeding quality of the food. This amounted to 5*s.* or 6*s.* a ton for green food in England, and 7*s.* to 9*s.* a ton for green food in Scotland, at which prices, taking roots and Grass together, it could be grown. There was all this difference as the result of differences of climate in the two countries: and under such variable agricultural conditions, he submitted that general sweeping assertions, however calculated to stir up attention, were not possibly applicable to the agriculture of the whole of so variable a country as Great Britain. He believed the value of Mr. Mechi's example amongst farmers to be very considerable, but in an indirect rather than a direct way. As he himself had told us, it was a great point "to provoke people to talk about such matters, causing a little wonder, disbelief, anger, and ultimate calculation and conviction." And all this Mr. Mechi had effected so as no other man could, for no other man, he believed, possessed such exuberance of good nature, or could stand the badgering which had been his lot, and was the lot of all enthusiastic teachers, especially if they carried on the learning and the teaching together, which had been Mr. Mechi's plan, or at least, had been his plan in the earlier years of his agricultural history. The so-called failures which he experienced at first were not forgotten yet, as was found at the meeting of the Farmers' Club last night. But his honesty in relating his experience, whatever it might be, was one of the most useful points in his character as a teacher. It seemed that people had yet to learn that in a fully recorded experiment the word "failure" was altogether a misnomer. Let all the circumstances, from the beginning to the end, from the first outlay to the "balance sheet"—from the first operation to the full weight and measure of the result—be recorded; and, let that result be what it might, it could not be a failure. An experiment was just a question put to Nature, and the answer *no* was often as useful and as valuable as the answer *yes*. He hoped, therefore, that whether his experience were a warning or a guide, whether its information were negative or affirmative, Mr. Mechi would continue, as he had done, to give it to the public; and then, whether he were considered the best of farmers or not, he would certainly continue to be one of the most useful men in the agricultural world.

Colonel Challoner had listened with attention and with very great pleasure both to the paper and to the discussion which had followed upon its reading. They had heard a great deal from Mr. Sidney—part of which he agreed with, whilst from other parts he must take the liberty of dissenting. One gentleman had said he should like to have a farm-yard entirely covered in. As far as his own little experience went, he should certainly like to have every animal under cover; but he should be sorry to run the risk of any inattention on the part of his farm-bailiff to have the yard entirely covered over, except so far as the cattle was fed in Warne's boxes, where the urine ran in such proportion as to keep the manure in a proper state. He could mention an instance of a yard being covered over, and he had seen the manure turned out in the month of March absolutely with a dry blue heat upon it. No one could say that was in a proper state to be used upon the land. As a general rule, he did not think farm-yards entirely covered in were very desirable. He would now perform the pleasing task which had been assigned him of proposing that the thanks of this meeting be given to Mr. Mechi, not only for his lucid and interesting paper, but in the name of the farmers of this country, for the expense, pains, and trouble he had been at to throw some light upon the science of farming.

Mr. Wren Hoskyns, on rising to second Colonel Challoner's proposal to the meeting, said it was difficult not to feel the application of the old motto—"Quot hominum tot sententiæ" to the wide field of opinion as well as experiment that the topics of agriculture had presented that evening. So infinitely various were the conditions of climate, soil, and season; so different, and often conflicting, the circumstances under which agri-

cultural experiment was made; so many and various the sciences, and even the faculties of mind called into play, that the difficulty of arriving at absolute conclusions was preceded by the more embarrassing one to a speaker, of selecting one topic out of so many. "British agriculture" was a wide field. Having, however, been requested to say a few words, he would address them on what appeared the more prominent topic of the evening's discussion, and indeed of very general discussion in all parts of the country—the application of sewage manure. Should it be applied in a liquid or in a dry condition? This seemed to him a most important and preliminary question. Were we employed upon the right problem in attempting its carriage and distribution, diluted with so enormous and costly a bulk of water, in a climate already so moist, and occasioning us so much labour and pains to part with our surplus fluid by drainage; or, was the truer and more economical problem, how to obtain the fertilising matter in its most condensed and solid form? He confessed the latter was the view to which he had been led, both by the results of his own experience and by that of others, whose opinions and experiments had been very convincing to his mind. He could not help indulging the belief, that if it were possible for all the fertilising matter produced or brought upon a farm, to be equally spread over it in its dry and "fixed" condition, we might trust to the abundant precipitation of moisture in this climate to dissolve and dilute it amply for the wants of the soil. Such, too, was the conclusion arrived at upon Mr. Huxtable's farms, which he had revisited only last week, and which had presented to him a strong instance of the abandonment of the "liquid" system. There the tanks had become receptacles for burnt soil, saw-dust, and pulverulent matter of every kind, to imbibe and solidify the liquid outpour of the farm-yard and buildings; and such he (Mr. Hoskyns) believed to be the most profitable and convenient mode of its applications; in the form, in short, of drill manure. He must, he supposed, add a word upon the subject of the steam-engine as applied to agricultural purposes, on which, while he cordially agreed with part of what had fallen from a previous speaker (Mr. Sidney), he could not accept his assertion that the subject of its future application and cultivation was beyond the pale of practical discussion. Had such a rule been acted on in the other arts of life, where would have been all the advancement which had carried civilization itself over the globe, by all the various operations to which the steam-engine had been, from time to time, and from invention to invention, newly applied? The practical difficulty which at present beset all the experiments towards this end with the steam-engine, was its own bulk and weight, increasing in equal ratio with its power, and thus appearing to refuse the twofold office of simultaneous cultivation and progression over the yielding surface of the field. But this, like other difficulties, might yet be overcome. Before sitting down, he must beg leave to second the proposition of Colonel Challoner, and in so doing to express his gratification at the interesting paper read to them that evening by Mr. Mechi, whose undaunted pioneering had led to so much interesting and valuable discussion, and whose ready and eloquent call had awakened many a slumbering agricultural question, and whose good-natured advocacy, where it failed to make a convert, had never made an enemy. He begged to second the vote of thanks to Mr. Mechi, proposed by Colonel Challoner.

The Chairman was sure he was only expressing the sentiments of all present in saying that they were greatly obliged to Mr. Mechi for the very interesting and instructive paper he had read to them. Indeed, although a great variety of topics had been touched upon by Mr. Mechi and the gentleman who had followed him, it was evident that the great question of interest had been as to the comparative merit of applying manure in the dry or liquid form. When it was considered how large a sum was paid by the British farmer for foreign and for artificial manures, it certainly became his duty, as well as his interest, at least fully to inquire how far such a course was necessary. That was to say, whether any process could be adopted by which the manure of the farm could be more effectively and economically distributed on the land. Although the utility of the sewage of towns, and the methods of applying the manures of the farm, had been mixed up in the discussion, he thought it did not follow that the most economical mode of employing the one must necessarily be so for the other also. The sewage of towns already existed almost entirely in a liquid form, whilst the manure of the farm was principally solid. If therefore the liquid form be the most practicable for the application of the sewage of towns, it did not follow that it would be the most profitable to convert the manures of the farm into the same condition. He was of opinion that where a large bulk of green produce was to be obtained within a limited area of land, the liquid form of manure would be the most effective. And if the sewage of London and other large towns were to be rendered available for agricultural purposes, he considered the most likely plan to effect it would be that of irrigation upon Grass; irrigated manures acting, in his opinion, much more successfully upon Italian Rye-grass or common pasture, than upon any other crop. However, he agreed with the opinion expressed by Mr. Sidney, that this question between solid and irrigated manures was entirely one of cost. And, that being the case, he did not think that at the present moment sufficient experimental evidence was before them to prove the economy of converting the manures of the farm into the liquid form, and in that state distributing them over the land.

SMITHFIELD.—*The "Great Market"*—1854, *Dec.* 11.—The usual bustle and excitement was again witnessed at this great gathering of fat meat.—The Devon breed was present in large numbers. The great improvement in the size of the animals of this breed is to-day universally admitted. It is so evident that we believe those who only know the breed as it appears at the Baker Street Bazaar would not take these large and splendid animals for the same class. Their quality in the market to-day is pretty good; but there is a general deficiency in ripeness. Their number must exceed 1500. Many would weigh from 150 to 190 stone of 8 lbs., and some few might exceed 200.—The Herefords are far behind our expectation both as to quantity and quality. The rails to which the cattle are tied, and which we have seen closely packed with these fine animals, are to-day studded with but few here and there, and many of them deficient in the qualities that mark good bullocks.—The short-horns are bulky, ripe, and well-proportioned animals, maintaining the position which they held in Baker Street. We would especially refer to those sent from Lincolnshire and Suffolk. Many splendid animals came from Leicestershire and Northamptonshire. Many sales effected under our notice could not have been less than 5*s.* 10*d.* per stone of 8 lbs. Great as has been the improvement in Devon breed, and praiseworthy as is the energy and intelligence of the breeders in the west, they have much to do before their breed stands on an equality with short-horns for weight and early maturity. Whatever may have been the deficiency in our market supplies of beef during the last six months, it has been less in the case of short-horn beef than in that of any other breed.—The Scots too have been tolerably abundant: of these there is a fair supply to-day, both of West Highlanders and Galloways, and all possessing in the highest degree good quality and symmetry and general excellence. And as far as our judgment goes of the sales that we witnessed nothing in the market fetched so high a price; the butcher had very little change indeed out of 6*s.* a stone. If the committee of the Smithfield Club had taken a walk round the show to-day, and paused a few minutes over about 40 Scots, shown by Mr. Macdonald, and bred by Mr. M'Combie, of Aberdeenshire, they must have come to the unanimous opinion that this breed stands second to none in merit; and we hope to see it greatly encouraged at our fat exhibition.—There was a fair show of foreign cattle not over fat, but containing among them some very fine bullocks, which found their way out of the market very early in the day. The Dutch cattle have yet plenty of room for improvement. They send us, however, some good calves, and the breed would stand higher in our estimation if they were all sent over while their bones are soft. As a whole we do not think the market equal to those of previous years either as to beef or mutton shown. In sheep some very fine old Downs were shown, and some capital cross breeds, and Mr. Hewser and others showed some good Cotswolds. A few fetched enormous prices, which were evidently the reserve of the Baker Street Show. The mutton trade was not so brisk, generally, however, as the beef. Though both fetched high enough prices to stop all mouths on the subject of agricultural distress, unfortunately the prices are also high enough to close the mouths of many agricultural consumers.—This, then, is the report of the last Christmas market that will be held in Smithfield. In a few weeks the new market in Copenhagen Fields will be opened; and the next Christmas market will be held in the larger space and more favourable circumstances which it presents. We hope shortly to lay before our readers with a full account of the arrangements there.

Notices to Correspondents.

COVENEY'S ECONOMICAL MANURE: *H S, and Others.* Thanks for your letters. If we have occasion to use them we will do so.

FOOD FOR OXEN: *W J B.* If you can get 2½ bushels of Barley meal for the same money as one bushel of Linseed meal, we should prefer the former. But your best plan is to use a mixture of the two—and the same money spent on this mixture, in the proportion of about two of the former to one of the latter, will purchase a more efficient food.

HAY: *J H.* We do not understand your question: if you mean which is best food for horses, then the answer depends altogether upon the circumstances of the case, though natural hay is generally better than artificial for the purpose.

LIQUID MANURE: *E H.* We suppose your small field to be in Grass: and in that case the application of the contents of your tank in the liquid form, if sufficiently diluted, to the surface of the land by means of pump and hose is probably the best plan of using it. The tank will be large enough, we presume, to hold a week's collection. The use of the pump at weekly intervals would not be a very heavy cost.

ROOFING: *J H.* In your circumstances asphalted felt is probably the best roofing—a little annual attention will keep it tolerably watertight.

SEED GROWERS: *J Moss.* It appears to us that "the reasonable request of the growers to have a voice in fixing prices" is not properly the subject of a "*request*" at all. If you don't like the prices offered you need not accept them, and so, instead of *asking* to have a voice, you will without asking cause your voice to be heard.

STEAMING APPARATUS: *W J B* asks what sort of boiler is most approved for steaming pigs' food. He requires to steam about one-half to three-quarters of a ton of Swedes or Mangold daily. He has kettles, &c., for the roots, but he wants to know the sort and size of boiler, the sized pipes required, and the proper method of securing against explosion, whether the pipe always being left open in some part is sufficient security.

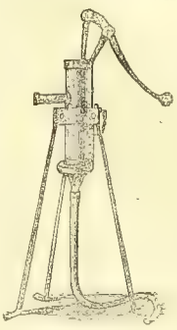
SUGAR: *Omega.* Sugar can only tend to produce a sleek coat by conveying into the system a readily soluble heat-producing or fattening substance. Linseed cake of the best kind would produce as good an effect or better at less expense. *W. C. S.*

ERRATA.—In the 1st line of col. *c*, page 793, for "earthiness" read "heartiness." In p. 797, col. *a*, 14th line from the bottom, for "He stated that Mr. Morton referred," &c., read "Mr. Morton referred," &c.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.



The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 *ft.* high.

1¼ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

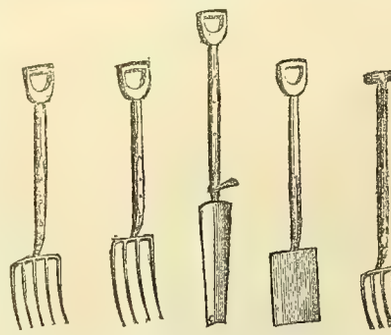
Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto ditto		2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



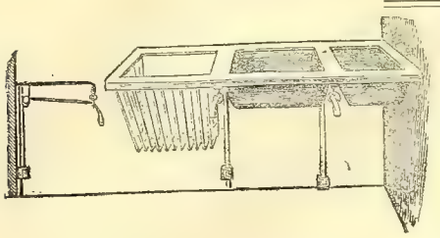
MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the CRYSTAL PALACE, SYDENHAM, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. CONSERVATORIES AND AVIARIES fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. WINDOW BLINDS of every possible description, of the very best materials and workmanship.
N.B. An allowance to nurserymen and the trade.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street City, and the Royal Mills, Wandsworth Surrey.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.



COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, as one Fixture, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest.

COTTAM'S ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.

IMPROVED PUMPS,

OF THE BEST WORKMANSHIP AND WARRANTED.

The VALVES and SUCKERS of these Pumps are constructed upon an entirely new and SIMPLE principle; they are not likely to get out of order; should they do so, can easily be repaired, as the Pump is so contrived that the valves can readily be got at.

An Improved CAST IRON TRAP, strongly recommended by the Sanitary Commissioners, and suitable for Sugar Bakers, Slaughter Houses, &c. &c. It is so formed that the Trap-plate will pass any matter the top grating will let through, and therefore is not liable to stoppages; and well adapted to Stables and Stable-yards, for saving the best part of Liquid Manure.

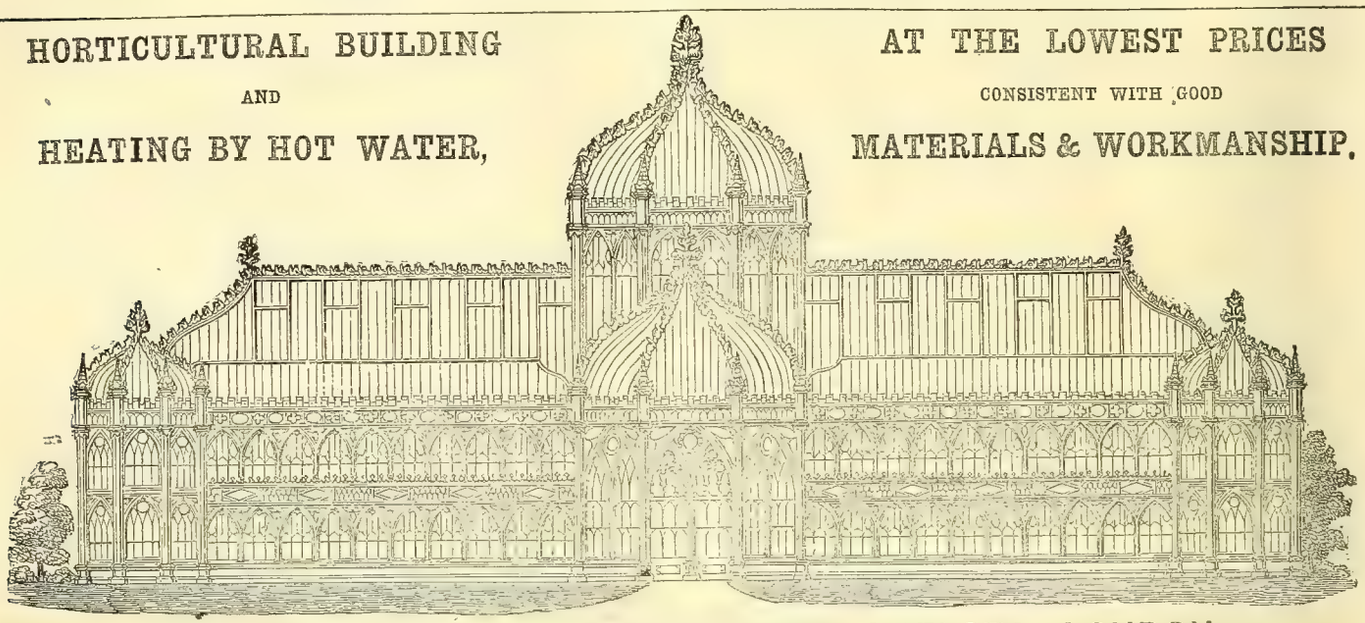
Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.



GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

HORTICULTURE IN ALL ITS BRANCHES.

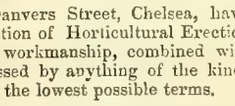
JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.



Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

6 in. by 4 in. to 6 in. by 5½ in.	...	13*s.* 3*d.*

8 „ 6, — 8½ „ 6½ ...		
9 „ 7, — 10 „ 8, 12 by 9, 12 by 10, 14 by 10	1 0 0	

Larger Sizes, not exceeding 40 inches long.

16 oz. from 3*d.* to 3½*d.* per square foot, according to size.
21 oz. „ 4½*d.* to 5*d.* „ „ „
26 oz. „ 6*d.* to 7½*d.* „ „ „

SIXTEEN-OUNCE SHEET GLASS OF ENGLISH MANUFACTURE FOR ORCHARD HOUSES, THE SAME QUALITY AS WE SUPPLY TO Mr. RIVERS, and of various dimensions, always on hand,

Double-crown Glass of various dimensions in 100 feet boxes.

Glass Tiles, ½ of an inch thick, packed in cases, containing 50, at 1*l.* 17*s.* 6*d.* per case. Packages 2*s.* each extra, but allowed for when returned.

Glass Milk Pans, 21*s.* per dozen; Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoys' Milk Syphons, Wasp Traps; Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, and every article in the trade.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge. ESTABLISHED A.D. 1700.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1*l.*—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square.

TEN THOUSAND STOVES.

THE TENTH THOUSAND OF THE PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, AND CO., 46, King William Street, London Bridge; and may be obtained of most Ironmongers.

The IMPROVED PATENT VENTILATING STOVE, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded post free.

FORD'S EUREKA COLOURED SHIRTING is now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.

FORD'S COLOURED EUREKA SHIRTS, Six for 27*s.*

FORD'S WHITE EUREKAS, best quality, Six for 40*s.*; second quality, Six for 31*s.*; if washed ready for use, 2*s.* extra.

CAUTION.—Ford's Eureka Shirts are stamped, "38, POULTRY, LONDON," without which none are genuine.

*** Catalogues with particulars post free.

RICHARD FORD, 38, Poultry, London.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES.—METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130B and 131, Oxford Street, second and third doors west from Holles Street.

SHOOTING WANTED.

WANTED, within 40 miles of London, easy of access by rail or road, from 400 to 1000 acres of good PARTRIDGE AND COVER SHOOTING. Possession will be required early in February next.—Address to W. A., 2, King's Road, Bedford Row, London.

PURE BRED SOUTH-DOWN EWES.

TO BE SOLD by a gentleman who has a large flock of sound pure bred SOUTH-DOWN SHEEP, will be overstocked at Lady-day, in consequence of giving up one of his Farms. He wishes to sell 100 Ewes, in lamb to tups now on the Farm. The ewes may be selected. Apply to Mr. W. Turner, The Shepherd, Dowdeswell, near Cheltenham, Gloucestershire.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

FANCY POULTRY.—PERIODICAL SALE.

MR. J. C. STEVENS will sell by Auction at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 19th December, at 12 o'clock precisely, a selection of first-class DORKING FOWLS from the yard of Mrs. FINCH NOYES, of Salisbury, very choice SPANISH POLANDS, BANTAMS, and many first-rate Vulture-hocked COCHINS, from celebrated breeders. Catalogues, by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

PEAR TREES.

THE CULTIVATION OF M. DE JONGHE, OF BRUSSELS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on SATURDAY, 23d December, at 12 for 1 o'clock, a collection of 25 of the best new varieties of PEAR TREES (Pyramid), some of which are on Quince Stocks, and comprising Prince Albert, Leopold I., Duc d'Orleans, Comte de Paris, Dr. Trousseau, &c., all of which are from the renowned establishment of M. DE JONGHE, of Brussels. — May be viewed on the morning of Sale and Catalogues had.

TO FLORISTS AND OTHERS.

MESSRS. JONAS AND THOMAS PAXTON are instructed to sell by Auction, on WEDNESDAY, December 20th, at 11 o'clock, the whole of the choice collection of Picotees, Chrysanthemums, &c., of the late Rev. A. H. Mathews, at Weston-on-the-Green, midway between Oxford and Bicester. —Catalogues may be had of the Auctioneers, Bicester, Oxon.

MITCHAM.

MESSRS. PROTHEROE AND MORRIS are directed by J. W. Dawson to sell by Auction without reserve, on the premises, Mordon Road, Mitcham, Surrey, on MONDAY, Dec. 18, 1854, at 11 o'clock, the NURSERY STOCK, consisting of Evergreens: comprising Chinese Arbor Vitæ, Laurel, Privet, Laurestinus, Hollies, Aucubas, Rhododendrons, Pyracantha, Honeysuckles, Currants, quantity of Rhubarb, Herbs, &c.—May be viewed prior to the Sale.—Catalogues may be had on the premises of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

CHRISTMAS PRESENTS.—The most appropriate offerings for this season of festivity are those which tend to the promotion of health and personal attraction: none can be more acceptable than ROWLANDS' MACASSAR OIL, for imparting a transcendent lustre to the hair, and sustaining it in decorative charm. ROWLANDS' KALYDOR imparts a radiant bloom to the cheek, and a delicacy and softness to the hands, arms, and neck; and ROWLANDS' ODONTO, or PEARL ENTIFRICE, bestows on the teeth a pearl-like whiteness, and renders the breath sweet and pure. The patronage of royalty throughout Europe, their general use by rank and fashion, and the universally-known efficacy of these articles give them a celebrity unparalleled.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.—Beware of spurious imitations.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2s. per Package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." Mrs. ELDER.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, &c.?—COUPELLE'S CRINUTRIAR, though extensively imitated, is universally acknowledged as the only preparation to be really depended upon for the unfailing production of Hair and Whiskers in two or three weeks; as also checking Greyness, Baldness, &c., and rendering the Hair beautifully luxuriant, curly and glossy. Mr. WILLIAMS, 8, Lowther Street, Liverpool.—"I can now show as fine a head of hair as any person, solely from using your Crinutriar." Sergeant CRAVEN, Longford Barracks, Ireland.—"Through using your Crinutriar, I have an excellent Moustache, which I had before despaired of." Mrs. CARTER, Pangbourne, Berks.—"My head, which was quite bald, is now covered with new hair." Price 2s. per Bottle, and four times the quantity at 6s. each, through all Druggists and Perfumers, or of ROSALIE COUPELLE, 69, Castle Street Newman Street, Oxford Street, London.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

HOLLOWAY'S PILLS STAND PRE-EMINENT FOR THE CURE OF ASTHMA.—Mr. Griffiths, Gardener of Gellygynan Hall, Denbighshire, was afflicted for a number of years with a violet Asthmatic Cough which caused him many sleepless nights, in truth the attacks were so severe at times that he could scarcely keep any food on his stomach for days together, and notwithstanding he resorted to various reputed medicines for the cure of Asthma yet he obtained no beneficial effect. At last he tried HOLLOWAY'S Pills, which he persevered in for about five weeks; the result was a perfect cure, and he now enjoys most excellent health. Sold by all vendors of Medicine; and at Professor HOLLOWAY'S Establishment, 244, Strand, London; and 80, Maiden Lane, New York.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2l. 11s. to 5l. 10s.; ditto, with ormolu ornaments and two sets of bars, 5l. 10s. to 12l. 12s.; Bronzed Fenders complete, with standards, from 7s. to 3l.; Steel Fenders from 2l. 15s. to 6l.; ditto, with rich ormolu ornaments, from 2l. 15s. to 7l. 7s.; Fire-irons from 1s. 9d. the set to 4l. 4s. Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,
2dly,—From those purchases being made exclusively for cash.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

	Thread Pattern.	Fiddle Pattern.	Brunswick Pattern.	King's Pattern.
Tea Spoons, per dozen ...	...	18s.	26s.	32s.
Dessert Forks „ ...	...	30s.	40s.	46s.
Dessert Spoons „ ...	...	30s.	42s.	48s.
Table Forks „ ...	...	40s.	56s.	64s.
Table Spoons „ ...	...	40s.	58s.	66s.

Tea and Coffee Sets, Waiters, Candlesticks, &c., at proportionate prices. All kinds of replating done by the patent process.

CHEMICALLY PURE NICKEL, NOT PLATED.

	Fiddle.	Thread.	King's
Table Spoons and Forks, full size, per doz.	12s.	28s.	30s.
Dessert ditto and ditto	10s.	21s.	25s.
Tea ditto	5s.	11s.	12s.

CUTLERY WARRANTED.—The most varied assortment of TABLE CUTLERY in the world, all warranted, is on Sale at WILLIAM S. BURTON'S, at prices that are remunerative only because of the largeness of the sales; 3½-inch ivory-handled table knives, with high shoulders, 11s. per dozen; desserts to match, 10s.; if to balance, 1s. per dozen extra; carvers, 4s. per pair; larger sizes, from 11s. 6d. to 26s. per dozen; extra fine, ivory, 32s.; if with silver ferrules, 37s. to 50s.; white bone table knives, 7s. 6d. per dozen; desserts, 5s. 6d.; carvers, 2s. 3d. per pair; black horn table knives, 7s. 4d. per dozen; desserts, 6s.; carvers, 2s. 6d.; black wood-handled table knives and forks, 6s. per dozen; table steels, from 1s. each. The largest stock in existence of plated dessert knives and forks, in cases and otherwise, and of the new plated fish carvers. Also a large assortment of Razors, Penknives, Scissors, &c., of the best quality.

LAMPS OF ALL SORTS AND PATTERNS.—The largest, as well as the choicest, assortment in existence of FRENCH and ENGLISH MODERATEUR, PALMER'S, CAMPHINE, ARGAND, SOLAR, and other LAMPS, with all the latest improvements, and of the newest and most *recherché* patterns, in ormolu, Bohemian, and plain glass, or papier-mâché, is at WILLIAM S. BURTON'S, and they are arranged in one large room, so that patterns, sizes, and sorts can be instantly selected.

Real French Colza Oil, 4s. 9d. per gallon.
Palmer's Candles, 9d., 9½d., and 10d. per lb.

DISH COVERS AND HOT-WATER DISHES in every material, in great variety, and of the newest and most *recherché* patterns. Tin Dish Covers, 6s. 6d. the set of six; Block Tin, 12s. 3d. to 28s. 9d. the set of six; elegant modern patterns, 34s. 6d. to 52s. 6d. the set; Britannia Metal, with or without silver-plated handles, 7s. 6d. to 11s. 6d. the set; Sheffield Plated, 10l. to 16l. 16s. the set; Block Tin Hot-water Dishes, with wells for gravy, 12s. to 30s.; Britannia Metal, 22s. to 77s.; Electro-plated, on Nickel, full size, 11l. 11s.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

Illustrated London News.

THE YEAR 1855 bids fair to be one of the most important and eventful of modern history. On the 6th of January, 1855, will be issued the first number of a new volume of the ILLUSTRATED LONDON NEWS, and not merely a new volume, but of a New Year—each volume being perfect and complete in itself—containing, for the time, a faithful record, pictorial and descriptive, of all Events of Interest in every part of the world. To that limited portion of the public who do not subscribe to this Journal it may be stated that no period could be selected more opportune for commencing,—the whole expense being but 2s. per annum, exclusive of double numbers, which are issued on rare occasions, when it would be impossible to crowd the important events and Engravings into a single number; for this small sum the subscriber will receive 24 large pages—72 columns—of the most interesting information, carefully selected from the News of the Week, interspersed with a variety of charming Articles on the chief topics of the day.

The ILLUSTRATED LONDON NEWS has, by its impartial and consistent advocacy of the welfare of the public, secured for itself a political influence scarcely second to any Newspaper in the Empire; and reference can, with some pride, be made to the support afforded to all beneficial measures proposed and adopted by the English Parliament.

Foreign Politics will ever command the attention which ought to be devoted to so important a feature of a Newspaper. On the question of the Russian War, during the year 1854, ONE THOUSAND ENGRAVINGS appeared in the ILLUSTRATED LONDON NEWS. Extensive arrangements, calculated to improve this popular Journal, and engagements such as will greatly enrich its Literary, Scientific, and other departments, have been made, and will thus combine on this Paper the greatest talent of the day.

The ILLUSTRATED LONDON NEWS has been established 13 years, during which period it has received a greater degree of encouragement and approbation than any Journal ever published. This is proved by the Return of Stamps issued from time to time by order of Parliament. The Stamps applied for the first six months of 1854 were upwards of 2,734,000—showing a WEEKLY CIRCULATION OF UPWARDS OF ONE HUNDRED AND THIRTY THOUSAND COPIES!

Terms (for payment in advance)—Half-year, 13s. 6d.; Year, 26s.

Any of the Volumes of the ILLUSTRATED LONDON NEWS, from the commencement to the present time, may now be had, in paper or cloth. Covers for Binding the Volumes 2s. 6d. each.

All Numbers may be sent free by post to any part of the Kingdom and the Colonies.

Give an order for six months to ensure all the gratuitous Prints and Supplements. Supplied by all Booksellers and Newsmen.

The ILLUSTRATED LONDON NEWS is published in London every Saturday, stamped, to go free by post, 6d. per copy.

Office, 198, Strand, London.

THE ANNUAL EXHIBITION AT GORE HOUSE KENSINGTON GORE, OF THE ELEMENTARY WORKS OF STUDENTS IN ALL THE SCHOOLS OF ART, in connection with the Department of Science and Art, both local and metropolitan, will be opened to the public on and after FRIDAY, the 22d December, Christmas Day excepted. Admission free, daily from 10 to 4, and in the evening from 7 to 9.

BOARD OF TRADE, DEPARTMENT OF SCIENCE AND ART.—AID TO PUBLIC SCHOOLS IN OBTAINING EXAMPLES FOR ART-INSTRUCTION.—The Lords of the Committee of Privy Council for Trade having resolved to furnish examples to Schools in accordance with the plan adopted by the Committee of Privy Council for Education, and to discontinue the practice of keeping a stock of such articles at the Department, NOTICE IS HEREBY GIVEN, that on and after the 1st of January, 1855, Examples will not be supplied directly from the Department of Science and Art as at present, but through Agents in London and the Provinces.

Forms of application for aid, and further information may be obtained at the Offices, Marlborough House, Pall Mall, London.

Marlborough House, 30th November, 1854.

Third Edition, considerably enlarged, price 5s. 6d.

RURAL CHEMISTRY.

By EDWARD SOLLY, F.R.S., F.L.S., F.G.S.,

Honorary Member of the Royal Agricultural Society of England Professor of Chemistry to the Horticultural Society of London Lecturer on Chemistry in the Hon E. I. Co.'s Military Seminary at Addiscombe, &c., &c.

J. MATTHEWS, 5, Upper Wellington Street, Covent Garden.

Price 3d. each, or 5s. for 25 copies for distribution among Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the office of the *Gardeners' Chronicle*.

In consequence of the new postal arrangements, parties in the country who desire it can have copies sent by post; six stamps, in addition to the cost of the numbers, will pass 10 copies free by post.

The cost of a single copy, free by post, is therefore 7d.; and of ten, free by post, is 3s.

J. MATTHEWS, 5, Upper Wellington Street, Covent Garden.

BEAUTIFUL NEW PLANT.

LUCOMBE, PINCE, AND Co., are now prepared to send out their beautiful New VERONICA HERMESINA, raised by that eminent Horticulturist, J. Luscombe, Esq., of Coombe Royal, who sent specimens to Dr. Lindley at the time of its first flowering, who thus pronounced his first opinion of it:—

"*The variety sent with this was charming; a decided rose colour having mingled with the violet.*"

See also notice of Dr. Lindley in the *Chronicle* for December 2d, 1854, as follows:—

"*L., P., and Co.: Your V. Hermesina is a handsome dark variety of V. Speciosa, its beautiful large spikes of deep purplish crimson blossoms cannot fail to make it a favourite.*"

Price 7*s.* 6*d.* each.—A few extra sized specimens may be had. The usual discount to the trade when three or more are taken.

Exeter Nursery, Exeter, Established 1720.

GREAT NOVELTIES FOR THE ENSUING SEASON,

FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

GALANTHIFLORA-PLENA

(The Double Snowdrop Corolla'd Fuchsia.)

Pure double white corolla, resembling a fine large double snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10*s.* 6*d.* each.

The usual discount to the Trade when three or more are taken.

Exeter Nursery, Exeter.—Established 1720.

GERMAN FLOWER SEEDS.

MOSCHKOWITZ AND SIEGLING, Erfurt, beg to inform the trade that their new Wholesale Catalogue of Choice German and other Flower Seeds, is now ready, and may be had on application to their Agent, Mr. H. Henkel, 70, Fenchurch Street, London.

NEW PERPETUAL STRAWBERRY.

"DELICES D'AUTOMNE."

A. VERSCHAFFELT, Nurseryman, Ghent, Belgium, begs to offer the new and Perpetual Strawberry "DELICES D'AUTOMNE." The fruit is large, delicious, and very abundant; it is certainly the best perpetual Strawberry of all. A correct drawing will appear shortly in Verschaffelt's "L'Illustration Horticole." Price, per plant, 2*s.* 6*d.*; six plants, 10*s.* 6*d.*

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. Kennedy, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

TRANSON FORTEAU, Nurseryman, Orleans, France, can furnish a hundred SHRUBS, healthy and bushy, in 10 or 15 varieties, at his choice, for 25*s.*:—Mahonia, Spirea (of sorts), Chamæcerasus, Syringa, Cytisus viburnum opulus, Caprifolium, Elder, and others.

Oranges, in pots, from 2 to 4 feet			8*s.* to 15*s.*
Cupressus pyramidalis, from 3 to 4 feet			2
Leban Cedar, from 3 to 7 feet			2*s.* to 4
Alnus cordata, a year seedling, 3 to 4 inches, per 100			2
Cupressus disticha, do., 1 to 1½ feet	„		40
Leycesteria formosa, do., 4 to 10 inches ...	„		3
Mahonia, 2 years transplanted, 5 to 10 inches	„		4

MESSRS. A. TOPFS AND CO., Erfurt, Prussia, in addition to their usual Catalogue of Flower Seeds, offer to the trade as under:—

CARNATIONS—STAGE FLOWERS.

	s.	*d.*
1000 Seeds from Choice Show Plants, unequalled for size, fragrance, and brilliancy	21	0
1000 from 500 named sorts	9	0
1000 Striped Yellow Ground...	11	0
1000 „ White „	9	0
1000 Flaked	11	0
1000 Flame Coloured	11	0

„ „ 2d ... „	7	0

Agent, Mr. W. Haslam, South Essex Nurseries, Epping.

WILLIAM BARRATT, Landscape Gardener, Wakefield.

*** Plans and Estimates furnished.

JOHN MORREN, General Commission Agent, Ock Street, Abingdon, is open for Commissions for the sale of Agricultural Implements, Manures, Seeds, &c., and for the purchase of Corn, &c.

CALAMITOUS FIRE AT MR. HOWIT'S, Nurseryman and Florist, Norbiton.—On the morning of the 7th inst., a fire, attended with a great loss of property, broke out in the Propagating and Cucumber Houses of the above Nursery, and before it could be extinguished, had destroyed all the valuable Stock, including the whole of his Cucumber Plants, upon the produce of which he entirely depended for the support of himself and family during the winter. The whole of many years' savings he has expended in building and stocking the above, and unfortunately not being insured, he is by this accident suddenly deprived of the means of carrying on his business, and is therefore reluctantly compelled to solicit the assistance of his friends to enable him to do so until the spring.

The under-mentioned Ladies and Gentlemen recommend this case as deserving the benevolence of the public:—W. Byam Marten, Esq., Bank Grove House; Miss Fassett, Grove House, Kingston; John Edwards, Esq., Wace Cottage, Holloway; Miss Massie, Themis Cottage, Kingston; Miss Cox, Grove House, Kingston; and Lady Colebrooke, Surbiton. The following have kindly consented to receive Subscriptions:—D. Beaton, Esq., Surbiton; Shrubsole, Mayor of Kingston; Mr. Gould, Market Place; Mr. Bond, Sun Hotel; Mr. Eldridge, Station Master, Kingston; Mr. Fairchild, Sycamore Grove, New Malden; and Mr. W. Ball, Chestnut Grove, New Malden.

Bound in cloth and interleaved, price 1*s.*,

THE SCOTTISH AGRICULTURIST'S ALMANAC AND YEAR-BOOK OF PROGRESS, for 1855. By John Lockhart Morton, Civil and Agricultural Engineer, Edinburgh.

THE COUNTRY GENTLEMAN IS INFORMED THAT

THE FIELD, the Country Gentleman's Newspaper, under new management, is devoted to the Sports, Occupations, and Amusements of the Country, the Field, the Garden, the Farm, the Country House. It is a first-class family newspaper. A copy sent to any person inclosing six postage stamps to the *Field* Office, 408, Strand.

A SUPPLEMENT, GRATIS, WITH THE WEEKLY DISPATCH, every Week until further Notice.—The unexampled interest which attaches to every incident connected with the operations of the Allied Armies in the East has determined the Proprietors of the Weekly Dispatch to devote a greater space to the intelligence from the seat of war than the ordinary limits of this, the largest newspaper published, could possibly afford; and, with the view of giving the amplest details, they have resolved upon the issue of a SERIES OF SUPPLEMENTS, GRATIS, which will include every particular of interest connected with the Siege and decision of the contest at Sebastopol, and will be continued whenever demanded by the progress of the Campaign.

By the publication of these Supplements the portion of the Paper usually devoted to incidents of domestic and political importance will be reserved intact, and the engrossing subject of the War will receive the fullest and most varied illustration.

A Supplement will be Published on Sunday next (Gratis), and on every succeeding week until further Notice.—Orders may be given to all Newsvendors in town and country; and to the publisher, at the *Dispatch* Office, 139, Fleet Street, London.

Just published, price 2*s.* 6*d.* boards, post prepaid 3*s.*, the Third Edition, revised and enlarged, of

THE BURIAL ACTS, 1852, 1853, 1854: being the Metropolitan Burials Act, 1852; the Burials (beyond the Metropolis) Act, 1853; and the Burials (beyond the Metropolis) Amendment Act, 1854; with the Incorporated Clauses from Cemeteries Clauses Act, 1847, &c. The Instructions and Regulations of the Home Office for providing Cemeteries and conducting Interments, and an Explanatory Analytical Abstract of all these Statutes; with Directions for the Constitution of Burial Boards, the Choice of Sites, and Formation and Planting of Burial Grounds, with Estimates for Works, &c.; and Copious Index. By James J. Scott, of the Middle Temple, Barrister-at-Law.

Cucumbers, in braces	C 1	C 2	—

*** In addition to the foregoing, the Society invites the exhibition of any objects possessing horticultural interest, among which are included not only ORNAMENTAL PLANTS and FRUIT of all kinds, in addition to those above enumerated, but ESCULENT VEGETABLES remarkable for their excellence; RAW MATERIALS from the Vegetable Kingdom useful in Arts, Manufactures, or as Food (Agricultural produce excepted), whether of home or colonial growth; GARDEN IMPLEMENTS; HORTICULTURAL MODELS; HONEY, in the comb or hive; and objects of Garden Decoration.

In no case can an exhibitor take more than one prize in the same class.

Everything intended for exhibition must be in Regent Street by 10 A.M. at the latest. WHATEVER ARRIVES LATER WILL BE ABSOLUTELY EXCLUDED FROM COMPETITION FOR PRIZES. Objects not perishable should be delivered the day before. At 11 A.M. the Judges will proceed to make their awards.

The exhibition will be open for inspection from 12 to 4 P.M.; after which hour, but not earlier, the exhibitors can remove their property. The chair will be taken at 2 P.M.

THE BRITISH POMOLOGICAL SOCIETY meets at the rooms, 20, Bedford Street, Covent Garden, London, on the first MONDAY of every month, to receive communications respecting Fruits and Fruit Trees, for the Election of Members, and for General Business.

All communications and packages containing specimens of Fruits, to be addressed to ROBERT HOGG, Secretary.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Polling Papers for the ensuing Election of Pensioners on the 17th of January next having been issued as usual, in the event of any subscriber not having received one, the Committee will be obliged by his making such omission known to the Secretary, that it may be rectified. No person will be allowed to vote whose subscription for the year 1854 is unpaid on the day of election. Subscriptions are due on the 1st of January.

E. R. CUTLER, Secretary.

December 23. 14, Tavistock Row, Covent Garden.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—HENRY SCHNEIDER, of Ford, Colerne, Chippenham, through his Advertisement, again appeals to the sympathy and kind support of the Subscribers of this Institution, being now 90 years of age, and in very destitute circumstances. His testimonials remain unimpaired, and he is encouraged to make another application to his kind friends who have hitherto favoured him with their votes, and other subscribers who will charitably lend him their aid at the forthcoming election in January next.

The following gentlemen will be gratified in receiving proxies in his favour:—Mr. Gregory, Cirencester, Gloucestershire; Mr. Burbank, Grittleton, Chippenham, Wilts; Mr. Spencer, Bowood, Calne, Wilts; Messrs. Garraway, Mayes, & Co., Bristol; Mr. Trotter, Badminton, Chippenham, Wilts; John Arthur Henderson, Esq., 64, Hamilton Terrace, London.

GARDENERS' BENEVOLENT INSTITUTION.
FOURTH APPLICATION.

WILLIAM THACKER begs earnestly to appeal to the subscribers, through the medium of an advertisement, from his total inability to incur, for the FOURTH TIME, the heavy expense of issuing circulars. He is aged 68, and he rests his claim to their benevolence on having been 59 years a gardener and five years a subscriber to the Institution; and that both his wife and himself are totally incapacitated, through infirmity, from supporting themselves. His case is strongly recommended by Mr. Alex. Dancer, Fulham; Messrs. J. & C. Lee, Hammersmith; Mr. T. Gaines, Battersea; Mr. Barto Chaundy, Lewisham.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1855 *will be published on* TUESDAY *next, December* 26. *Price* 6d.; *to be had of all Booksellers, and from* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth.*

LYNCH'S STAR OF THE WEST CUCUMBER, *the best frame variety in cultivation. For description, see* RENDLE'S "*Price Current and Garden Directory*" *for* 1854.

Price 1*s*. 6*d*. and 2*s*, 6*d*. per packet.—Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

NEW SEEDS JUST HARVESTED *can now be obtained of the most genuine description, from* WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

THE PAMPAS GRASS, GYNERIUM ARGENTEUM.

LUCOMBE, PINCE, & CO. have a fine healthy stock of this highly ornamental plant, well established in pots, and fit to send out immediately.

Specimens of it are now and have long been flowering in their nursery, and it is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See woodcut and description of it in *Gardeners' Chronicle* of the 4th ult.

Sizes, prices, and all particulars may be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.

FINE TRAINED FRUIT TREES IN A BEARING STATE.

" Shaws	4	6	Orkney Reds	5	0
Scotch Cups	4*s*. 6*d*.				

Terms cash. The usual allowance to the trade.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.

To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

CHINESE POTATO (DIOSCOREA JAPONICA).

SUTTON AND SONS, IMPORTERS of the above-named popular esculent, have the pleasure of informing their friends that they will be able to supply them at a moderate price, particulars of which may be had on application, addressed JOHN SUTTON & SONS, Reading, Berks.

SUTTON'S EARLY CHAMPION, WAITE'S DANIEL O'ROURKE, FAIRBEARD'S NONPAREIL, and other new early PEAS may be obtained genuine at moderate prices, by retail of SUTTON and SONS, Seed Growers, Reading, Berkshire.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.

Seed Establishment, 181, High Holborn, London.

NONPAREIL PEAS.

WILLIAM FAIRBEARD begs to inform the trade that he is now ready to execute any orders he may be favoured with. This Pea W. F. is confident will become a general favourite both for Garden and Field culture. Price can be had on application.—Mount Pleasant Nursery, Queen Street, Sittingbourne, Kent.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s*. per lb. smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

HOLLYHOCK SEED.

R. PARKER has now ready for sending out Seed of this year's saving from the finest named varieties in cultivation, in packets at 1*s*. and 2*s*. 6*d*. each. A remittance or reference to accompany all orders from unknown correspondents —Paradise Nursery, Hornsey Road, London.

GENUINE GARDEN SEEDS.

LUCOMBE, PINCE, AND CO., beg leave to announce that they have just completed their supply of the above, all carefully selected from the stocks of the best growers, superior in quality and economical in price, to which they respectfully call the attention of those who require a really genuine article. Their long experience in the Seed Trade (always also proving the vitality of their seeds before sending them out) fully justifies them in saying that their seeds cannot fail to give great satisfaction.—Catalogues may be had on application.

Exeter Nursery, Exeter. Established in 1720.

GERMAN FLOWER SEEDS.

MOSCHKOWITZ AND SIEGLING, Erfurt, beg to inform the trade that their new Wholesale Catalogue of Choice German and other Flower Seeds, is now ready, and may be had on application to their Agent, Mr. H. HENKEL, 70, Fenchurch Street, London.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

EXOTIC NURSERY, CHELSEA.

JAMES VEITCH, JUN., will be happy to forward his new Retail VEGETABLE, AGRICULTURAL, AND FLOWER SEED LISTS on application, and desires to assure those who may kindly favour him with their orders, that he has spared no pains in procuring his supplies from the first growers on the Continent as well as in this country, and that he will use his best endeavours to give his customers entire satisfaction.

TO THE SEED TRADE.

ABRAHAM HARDY AND SON, SEED GROWERS, beg to announce that their Wholesale Priced CATALOGUE of SEEDS, growth 1854, is now ready, and may be had on application.—Maldon, Essex, December 23.

Established 1720 at 28, Cornhill.

SEED GROWERS' SOCIETY.—The Members of the above Society are now prepared to send LISTS of AGRICULTURAL, GARDEN, and FLOWER SEEDS to those who are desirous of having them genuine and direct from the Growers.—Applications addressed to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex, will meet with prompt attention.

THE CHAMPION OF ENGLAND DAHLIA, one of eight recommended last year by Mr. Glenny, but not let out for want of sufficient stock, and one of the best eight this year is for sale. Mr. Glenny, Horticultural Agent, Dungannon House, Fulham, is authorised to sell the stock for the raiser to one or more persons in the trade. Particulars on application. The demand for this Dahlia will be greater than for any other.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s*. per doz.; HOWARD'S PRINCE ALBERT, 12*s*. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.

Manor Farm, Deptford, Dec. 23.

GLENNY'S SUPERB BALSAM SEED from the largest and most double Flowers in the world. Six classes, 37 stamps; 50 seeds mixed, 13 stamps—in sealed packets only—with Directions for Culture.—Letters to Mr. GLENNY, Horticultural Agent, Auctioneer, and Valuer, Dungannon House, Fulham.

TWO NEW CUCUMBERS.

SIR COLIN CAMPBELL AND GENERAL CANROBERT.

THE ABOVE are two of the Finest and most Superb New Hybrid Cucumbers ever yet sent out for Exhibition, Winter Cultivation, and every other purpose for which a Cucumber is required.

SIR COLIN CAMPBELL CUCUMBER.

The above Cut is an exact representation of one of the fruit grown this summer, which measured exactly ten of its diameter long, being 25 inches, with not more than half an inch handle. It is a splendid Black Spine, of a dark green colour, and free from ribs or shrivels; grows very quick, sets free, and carries its bloom well. As a Cucumber for Exhibition nothing can surpass it, and is very prolific, often throwing out four or five fruit from every joint, and the vines are short jointed. The fruit is solid, and eats very crisp, and for market it keeps its bloom well for many days, not turning colour at the stem or point as most varieties do. Fruit was cut from the above in January last, and the same plants continued to produce fine fruit until the end of October.

GENERAL CANROBERT CUCUMBER.

This is also a most superb variety for winter cultivation, for which it is best adapted, being a hybrid from Lord Kenyon's Favourite and Phenomena. It has a great advantage over Kenyon's in length, growing to about 18 inches in the same time in which Kenyon's will grow 12 inches; it is equally as hardy and productive. Of a dark green appearance, Black Spine, and a free setter; fruits freely during the whole of the winter, and always grows a very even size from stem to point. It will swell off two or three fruit at a time on a plant, during the depth of winter, and carry them out well, which it does with less heat than any other: this has been proved when several varieties have been grown together, this having the coldest part of the house. The object of the raiser of the above superb varieties has been to obtain perfection and hardiness, in which he has succeeded, by continually hybridising different varieties.

Sold in Packets of Five Seeds, 3*s.* 6*d.* each, or 1 Packet of Sir Colin Campbell and General Canrobert for 6*s.*

The following fine varieties of Cucumbers and Melons, which have been thoroughly proved and have given the greatest satisfaction to all Purchasers, can be supplied.

CUCUMBERS.

Camerton Court	... 1 0	Snow's Hybrid ...	... 1 0

A Packet of either of the Melons will be given to all Purchasers of the two new Cucumbers advertised above.

A Remittance must accompany every Order by Cash or Penny Postage Stamps, and the whole, or any part (as the case may be), will be immediately forwarded.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, and FLORIST, 14, Abbey Church Yard, Bath, Somersetshire.

The New Chinese Potato, Dioscorea (Japonica) Batatas.

MR. JOHN HENDERSON,

Formerly of the Firm of JOHN A. HENDERSON & Co., Pine Apple Place, London,

HAS the pleasure of informing the Public that he has just completed the Purchase from M. PAILLET, of Paris, of his entire Saleable STOCK of the above introduction from China, the nutritive properties of which are said so far to surpass the ordinary Potato that it is likely, not only to act as an auxiliary, but entirely to SUPERSEDE that valuable but uncertain esculent.

The most satisfactory results have followed from personal experiments, and proved that when cooked in the ordinary manner, from the large amount of FARINACEOUS properties it contains, it can NEVER become waxy, as is too generally the case with the Potato. Its FLAVOUR resembles in delicacy an early ASH-LEAVED KIDNEY; but, independent of the above excellent qualities, there is every probability of its taking a still more important position in the ECONOMY of this country, for, when dried and reduced to powder, it is equal to the best ARROW-ROOT; or mixed in the proportion of one-third with two-thirds of wheaten flour, it makes an extremely light and wholesome BREAD, as well as very superior PASTRY.

MESSRS. VILMORIN & Co., speaking of it, observe:—"Of all the esculent roots proposed as substitutes for the diseased Potato, the DIOSCOREA JAPONICA is certainly the only important one. It is easily propagated. The tubers are large and long, the flesh very mealy and devoid of any peculiar or disagreeable flavour. The DIOSCOREA JAPONICA is, in our opinion, a PRECIOUS ACQUISITION."

M. PELÉ, Horticulturist, Paris, in his Supplementary Catalogue of this autumn says:—"A new alimentary root, introduced into France by M. MONTIGNY, French Consul in China. Serious experiments have shown that this tuber will be much more advantageous to cultivate than the Potato, both in regard to its QUALITY as well as PRODUCE."

M. PAILLET, to whom the Imperial Society of Agriculture and Commerce of France has awarded the sum of 3000 francs as encouragement for having brought it into cultivation, also notices that "this tuber attains at least 1 to 2 lbs. weight. In its growth it is less delicate than the Potato, which unfortunately has of late years much degenerated. It does not require particular care, and its abundant produce amply repays cultivation. Its taste is pleasant, and being a root which contains a large amount of FARINA, will be a great addition to the FOOD OF THE PEOPLE as soon as it becomes generally known. It is so HARDY that it has passed the winters of 1853-4 in the open ground, without having in the least suffered from frost. It is also found that the STEMS and LEAVES, which are very numerous, form an EXCELLENT FOOD FOR CATTLE."

Tubers, with description of the Chinese Mode of Culture, to be obtained of MR. JOHN HENDERSON, KINGSKERSWELL, SOUTH DEVON, at the following prices, for cash only:—

4 Tubers ... ... £0 10 0 | 10 do. ... ... £1 2 6 | 50 do. ... ... £5 5 0 | 100 do. £10 0 0

Post-office orders are requested to be made payable at Newton Abbot, South Devon. The usual discount allowed to the trade when not less than 50 are taken.—P.S. All orders unaccompanied by a remittance will be considered as not received.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION FOR PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regent's Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by MR. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope MR. JACKSON'S process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

SPLENDID NEW RHUBARB.
SALT'S CRIMSON PERFECTION.

ROBERT SALT begs leave to inform the Gentry, Nurserymen, Gardeners, &c., that this splendid variety of Rhubarb is now ready for distribution. It is universally allowed to be the most early, prolific and delicious variety ever offered to the Public.

See *Gardeners' Chronicle* June 11, 1853: "Very good, and of a most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."—ED.

Certificates of Merit were awarded for specimens exhibited at the Meeting of the Horticultural Society, Regent Street, London, June 28th, 1853—at Nottingham, May 24th, 1854—at Derby Midland, May 25th, 1854—at Ormskirk, Lancashire, August 30th, 1854. Price 7*s.* 6*d.* per root, 3 for one guinea, and 6 for 2*l.*

Orders addressed to ROBERT SALT, Longton, Staffordshire; or the following agents, will have immediate attention: Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London; Messrs. BURGESS & KENT, Penkhull, Staffordshire; Mr. WOOD, Nurseryman, Coppice, near Nottingham; Messrs. FRANCIS & ARTHUR DICKSON, East-gate Street, Chester; Mr. SALISBURY, Melbourne, Derbyshire. A liberal discount allowed to the trade. A Post-office order from unknown correspondents.—Longton, Dec. 23.

SUPERIOR EARLY BROCCOLI.

MITCHINSON'S PENZANCE OR EARLY WHITE CORNISH BROCCOLI.—*Celebrated and invaluable for its earliness, coming into use early in February, a full-sized handsome head of excellent quality, but a shy seeder,* 1*s.* 6*d.* *per packet, or* 12*s.* *per ounce.* New Seed can be had in sealed packets of the following Agents in London:—NASH, MINIER, and Co., Strand; DAWE, COTTRELL, and BENHAM, Moorgate Street; HURST and MCMULLEN, Leadenhall Street; FLANAGAN & SON, 9, Mansion House Street; or from MITCHINSON'S Seed Establishment, Truro, Cornwall.—December 23.

From numerous unsolicited Testimonials we select the following:—

To Messrs. Mitchinson and Co., Seed Merchants, Truro, Cornwall.

"Sirs,—I have enclosed 18 postage stamps for a packet of your Penzance Broccoli Seed, the same kind as you sent me last year. I hope I am not too late, for I am anxious to procure it, if possible, for I can bear testimony to its value as a new, early, and a superior Broccoli, for I have been cutting upwards of 30 heads every week from the beginning of February.

"Dorking, Surrey, April 6, 1854. "W. UNDERWOOD."

To Messrs. Mitchinson and Son, Seedsmen, Truro, Cornwall.

"Sirs,—I enclose you 1*s.* 6*d.* worth of stamps, and hope you will send me a small packet of the Early Broccoli you advertised last year. I have beat all my neighbours this year with your Broccoli, which has been very fine and true, and stood the winter well. "GEORGE PENDER."

"Sandgate, Kent, April 10, 1854."

To Mr. Mitchinson, Seedsman, Truro.

(Enclosed with Specimen).

"Sir,—I beg to forward you this Broccoli, one of the sort after your own name. I have had a splendid crop of them this season, many of which measured three feet in circumference, and quality excellent. Cut the first on the 11th of February. If seed is scarce, be kind enough to save two packets.—T. BICE, Gardener, Grampound, Cornwall. April 7, 1854."

DICKSON'S EARLY FAVOURITE PEA.

FRANCIS AND ARTHUR DICKSON AND SONS, SEED MERCHANTS, &c. Chester, have much satisfaction in introducing the above NEW Pea, which they believe they are perfectly justified in saying is the BEST and MOST PROLIFIC EARLY PEA in cultivation.

It has been tried side by side with all the best early and second early Peas of the day, and has been pronounced by many eminent gardeners who saw it under these circumstances to be much superior to any variety of its season hitherto introduced.

It comes in about a week later than the Early Emperor (sown at same time), grows about 4 feet high, and produces a wonderful profusion of pods, which contain on an average TEN PEAS of EXCELLENT QUALITY and FLAVOUR. It has been grown the last two seasons in the Gardens of the Horticultural Society, and Mr. Thompson, in reporting upon it, writes as follows:—

"Horticultural Society's Gardens, Dec. 20th, 1853.

"In reply to your inquiry respecting DICKSON'S EARLY FAVOURITE PEA, I beg to state that I consider it a *new* and *very desirable* variety. It is very prolific in pods, and also as regards the number of Peas in the pods, and the quality is excellent. It most resembles the Auvergne, but is earlier than that excellent sort, and the pod is not so much hooked. "R. THOMPSON."

"Horticultural Society's Gardens, June 28th, 1854.

"I beg to hand you a copy of the memorandum which I made respecting your Early Favourite Pea, amongst others, again this season. About 4 feet high, very prolific; pods long, roundish, slightly curved, containing on an average nine to ten Peas of excellent quality. Bears some resemblance to the Auvergne, but differs in having straighter pods, and it is much earlier than the Auvergne. *An excellent prolific Early Pea.*

"R. THOMPSON."

Price 3*s.* 6*d.* per quart; per pint, 2*s.*

Messrs. HURST & M'MULLEN, Seedsmen, &c., 6, Leadenhall Street, London Agents.

N.B. The trade supplied on liberal terms.

106, Eastgate Street, Chester, and 14, Corporation Street, Manchester.—December 23.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.	Pinus canadensis, 3 to 8 feet
Cedrus Deodara, in any quantity, from 1 to 3 feet high	Cupressus macrocarpa or Lambertiana, 4 to 7 feet
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants	,, thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Cedars of Lebanon, 3, 4, 6, and 10 feet high	Juniperus, Upright Irish, perfect columns, 3 to 7 feet
Pinus Douglasi, 3 to 10 feet	,, chinensis, 2 to 8 feet
,, insignis, 2 to 7 feet	Yew, common English, 3 to 8 feet
,, Menziesi, 3 to 7 feet	,, Irish, 4 to 10 feet
,, pinsapo, fine plants, 3 to 6 feet	,, gold-striped, 1½ to 3 feet
,, Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome	,, do., tall standards, 4 to 7 ft.
,, nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders	,, Dovaston, or Weeping, worked on tall straight stems
,, Montezumæ, 2 to 4 feet	Thuja aurea, the finest plants in the country
	Libocedrus chilensis, the finest plants in the country
	Large variegated Hollies
	,, Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

NURSERY AND SEED ESTABLISHMENT.
LEXDEN ROAD, COLCHESTER.
(ESTABLISHED UPWARDS OF THIRTY-FIVE YEARS.)

HORATIO BUNTING begs to announce that his extensive CATALOGUE of FLOWER and VEGETABLE SEEDS is now ready, and may be had on application, by inclosing two postage stamps. He can confidently recommend the articles therein enumerated, as nearly every article is his own growth, true to name, and of first-rate quality. Early orders will oblige, as the quantities of Lettuce and several other things are limited.—N.B. Please to observe the Address.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. Packets of seed, consisting of 20 varieties, selected from the best show flowers, 5*s.*; 12 varieties, 2*s* 6*d.*; and from good double sorts, 1*s.*

Very superior Quilled German Asters, 12 distinct varieties, separate, 2*s.*, mixed 1*s.* per packet. Also Choice French Asters, 12 varieties, separate, 3*s.*, mixed, 1*s.* 6*d.* Fine Quilled African Marigolds, lemon and orange, 6*d.* per packet.

New Double Crimson ROCKET, excellent bedding plant for spring flowering, 6*s.* per dozen, or 2*l.* per 100. Double French White, 4*s.* per dozen, or 30*s.* per 100.

Saffron Walden Nursery, Dec. 23.

PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

J. AND J. FRASER have to offer a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application.

In offering these Pears, grafted on the Quince stock, we would wish particularly to call attention to their many excellent qualities. They are very compact in growth, and most prolific in bearing, fruiting profusely while the trees are small; thus forming a great acquisition for a small garden. Planted by the side of walks, in addition to their utility, they add much to the neatness and beauty of a kitchen garden. Indeed too much can scarcely be said in favour of these miniature Pear trees; as a proof of their merit the demand for them is yearly increasing.

Strong Trees, showing Fruit Buds, 2*s.* 6*d.* to 3*s.* 6*d.* each.

Lea Bridge Road, Essex, December 23.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4*s.* per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s.* per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s.* per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

THE NEW CHINESE POTATO, DIOSCOREA (JAPONICA) BATATAS.

TUBERS OF THE ABOVE ESCULENT MAY BE OBTAINED OF

MR. JOHN HENDERSON, KINGSKERSWELL, South Devon, to whom POST-OFFICE ORDERS should be made payable at "NEWTON ABBOT," South Devon. They may also be had genuine from the following Nurserymen and Seedsmen who have received their supplies from Mr. J. H.

Mr. John Slater, Malton, Yorkshire; Mr. Alex. Pontey, Plymouth; Messrs. Minchin and Son, Hook Norton, Oxford; Mr. John Halley, Blackheath, Kent; Mr. William Nicholson, Egglescliffe, Yorkshire; Messrs. Dickson and Co., Edinburgh; Mr. Joseph Bates, Oxford; Messrs. J. Major and Son, Knosthorpe, Leeds; Messrs. Drysdale and Co., Glasgow; Messrs. Jas. Veitch and Co., King's Road, Chelsea; Messrs. Garraway and Co., Bristol; Mr. W. Deans, Jedburgh, N.B.; Messrs. Edward Sang and Sons, Kirkaldy, N.B.; Mr. Wm. Mitchell, Endfield Highway, Middlesex; Mr. J. Roy, jun., Aberdeen, N.B.; Mr. Jas. Carter, 238, High Holborn, London; Mr. Daniel Livingston, Dublin; Messrs, Morrison and Son, Banff, N.B.

TO THE SEED TRADE.

MESSRS. ARTHUR HENDERSON AND CO. are now prepared to supply SEEDS of the following recent introductions.

N.B.—Mr. W. H. DUNNETT (the raiser), Seed Grower, Dedham, Essex, will also execute all orders intrusted to him with the greatest care and attention.

WHITE TOPPED CLARY, a fine showy hardy annual, remaining a long time in flower—

1 oz. ... 5*s.* | 4 oz. ... 15*s.* | 8 oz. ... 25*s.* | 16 oz. ... 40*s.*

LIMNANTHUS SULPHUREA ODORATA; yellow ground, edged with white and rose-coloured stamens; a beautiful trailing hardy annual, very sweet scented, and throwing off its fragrance like the Mignonette, and continuing in flower for a considerable period:

1 oz., 10*s.* 0*d.* | 4 do., 35*s.* | 8 do., 60*s.* | 16 do., 100*s.*

DIANTHUS DUNNETTII SUPERBUS; very dwarf, fine dark Sweet William—

1 oz., 20*s.* | 2 oz., 35*s.* | 4 oz., 63*s.* | 8 oz., 105*s.* | 16 oz., 163*s.*

Pine Apple Place, Edgeware Road, London.

TO THE SEED TRADE.—In consequence of numerous applications for WHOLESALE priced Lists of Seeds, causing considerable expense and inconvenience in replying by post, we beg respectfully to intimate that we do not profess to do the Wholesale Trade, as we grow our seeds expressly for Retailing, and take more care in keeping each kind true and fine, than we could possibly afford to do were we to grow for the purpose of selling at Wholesale prices. It does, however, occasionally happen that we have more than we require of some few articles, which we are glad to offer to the Trade on advantageous terms.

The undermentioned can be warranted new and genuine, the Wholesale prices of which may be obtained on application, stating quantity required.

Yellow Globe Mangold Wurzel.
Long Red " "
White Swede.
Orange Jelly Turnip.
Sutton's Lincolnshire Red Turnip
White Globe "
Sutton's Imperial Cabbage.
" Solid White Celery.
" Superb Pink Celery.

JOHN SUTTON AND SONS, Seed Growers, Reading, Berks.

BASS AND BROWN'S NEW AUTUMN CATALOGUE, supplied free for three Penny Stamps. They have this season a very fine and vigorous stock of the finest Roses, among which are a number of very superb new Continental varieties, consisting chiefly of the perpetual class. The following selections will be highly approved,

ROSES.

100 Standards in 100 very superior varieties ...	...	£7 10 0
100 " 50 " " ...	...	6 10 0
50 " 50 varieties ditto, all selected from perpetuals	...	4 0 0
100 dwarfs and half standards, or all dwarfs, in 100 very superior varieties	...	4 0 0
100 ditto in 50 varieties, ditto	...	3 0 0
50 ditto in 50 varieties, ditto, all from perpetuals	...	2 10 0
Fine mixed dwarfs, per 100...	...	1 10 0

Hardy Herbaceous Plants, Hollyhocks, prize-named Gooseberries, Strawberries, Standard Dwarf and Trained Fruit Trees, Flower Roots, and a variety of desirable articles offered in selection for present planting, for which see *Gardeners' Chronicle*, Oct. 14, page 659, and Oct. 28th, page 690.—Goods, carriage free (not under 20*s.*), to all the London termini, and all Stations on the London and Norwich Colchester Line. Plants added gratis with orders of 40*s.* and upwards.

Seed and Horticultural Establishment, Sudbury, Suffolk.

GREAT NOVELTIES FOR THE ENSUING SEASON,
FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

GALANTHIFLORA-PLENA

(The DOUBLE Snowdrop Corolla'd Fuchsia.)

Pure double white corolla, resembling a fine large double snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10*s.* 6*d* each.

The usual discount to the Trade when three or more are taken.

Exeter Nursery, Exeter.—ESTABLISHED 1720.

RENDLE'S COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS *will be ready in a few days. They can be had to suit various sized Gardens at the following prices:—*

No. 1 COLLECTION ...	...	... £3 0 0
" 2 " ...	...	... 2 0 0
" 3 " ...	...	... 1 5 0
" 4 " ...	...	... 0 15 0

The quantities are fully detailed in their "Price Current and Garden Directory," a new edition of which is now in the Press.

WILLIAM E. RENDLE & CO., Seed Growers, Plymouth.
ESTABLISHED 68 YEARS.

A. VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer to the trade:—

Lilium lancifolium album, strong bulbs, ...	per 100	£3 0 0
" " speciosum	" ... "	5 0 0
" Brownii (true), ...	" ... "	0 7 6

The Bulbs are strong and healthy.

A. V. begs to offer also good and fresh Seed of the fine LILIUM GIGANTEUM at the following prices:—A Parcel of 50 Seeds, 7*s.* 6*d.*; ditto 100 ditto, 13*s.*

P.S. The last number of the first volume of VERSCHAFFELT'S L'ILLUSTRATION HORTICOLE is just out, and contains:—1, Magnolia Lenné; 2, Gentiana Fortunei; 3, a plate with seven new Geraniums (Odier); 4, Azalea indica alba illustrata; and 5, a View of the Editor's Horticultural Establishment.

PRIZE CUCUMBERS.

SUTTON'S BERKSHIRE CHAMPION, the finest formed Cucumber in cultivation, 18 to 24 inches, per packet 1*s.* 6*d.*

CRAWSHAY'S PRIZETAKER, 30 to 34 inches, quite new, has gained prizes at several important Shows, per packet, 1*s.* 6*d.*

CONSTANTINE'S INCOMPARABLE, fine black spine, per packet, 1*s.*

LORD KENYON'S FAVOURITE, the most prolific and suitable for early forcing, 14 to 18 inches, black spine, per packet, 1*s.*

CUTHILL'S BLACK SPINE, seed direct from Mr. Cuthill, per packet, 6*d.*

Seed of the above superior sorts of Cucumbers may be had, post free, of JOHN SUTTON & SONS, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 23, 1854.

AMONG what are usually thought uncultivable plants the MANGOSTEEN was once pre-eminent. Indian gardeners pronounced it hopeless to attempt its growth beyond the hot and damp Indian archipelago. In Bengal it perishes. When it was first brought over some 30 years ago, all the seedlings quickly died, although placed in the care of different gardeners at that time standing high in their business. Even when carried to Surinam, the moist and warm climate of which was expected to agree with it, still the attempt to make it even live was a failure.

Nevertheless the high reputation borne by the Mangosteen continued to lead to further trials. Of all known fruits it is the pride of the countries to which it exclusively belongs, and seems to meet the approbation of persons of the greatest diversity of taste in other matters. In shape and size the fruit resembles a middle-sized Apple; but has a thick dark purple or brownish red rind, which is hard on the outside but soft and succulent within. This encloses three or four cloves consisting of a soft semi-transparent snow-white pulp, which is the part eaten, or rather sucked, for it dissolves in the mouth. Its characteristic quality is extreme richness of flavour, without being luscious or cloying; and it may be eaten in any moderate quantity without danger of surfeit or other unpleasant effects. Dr. ABEL, speaking of it, says that he and his companions were anxious to carry away with them some precise expression of its flavour, but after satisfying themselves that it partook of the compound taste of the Pine-apple and the Peach, they were obliged to confess that it had many other equally good but utterly inexpressible flavours.

The word impossible has of late years been generally struck out of gardening books; and certainly in the case of the Mangosteen, it has proved to be wholly inapplicable, for it is well known that both in the tropical fruit-house at Syon, preserved with such great care by the Dukes of NORTHUMBERLAND, and at Leigh Park, in Sir GEORGE STAUNTON'S stoves, the plant has for several years continued to remain in the most perfect health. We are now able to announce, with great satisfaction, that the care and skill with which it has been treated have been at last rewarded; and that first at Syon, and then at Leigh Park, the plants have produced their flowers—for the first time, we believe, out of the western portion of the Malay Archipelago. We are unacquainted with the precise circumstances which led to this gratifying event at Leigh Park, but we are enabled, by the favour of his Grace the Duke of NORTHUMBERLAND, to publish the following very satisfactory account of the cultivation at Syon and its results, drawn up by Mr. JOHN IVISON, to whom belongs the honour of having achieved the first success.

"The Mangosteen plant now fruiting at Syon, and another about the same size, were brought from Calcutta by Capt. WHITE in 1833, and were most probably forwarded by the late Dr. WALLICH while superintendent of the botanic garden there. Both plants were very small when they arrived; they were placed in a warm stove, and were permitted to remain in the soil in the case in which they were imported until they began to grow; after that they were potted in turfy loam and white sand, well drained, and were plunged into a bark bed. When they became too tall for that situation, they were removed to the tropical-house, where they increased rapidly in size, making two growths regularly every season. They were shifted into larger pots or tubs as they appeared to require it, until about three years ago, when the plant now bearing fruit was placed in a tub 3 feet square, and his Grace the Duke of NORTHUMBERLAND, thinking it had become large enough to fruit, caused a partition to be made in the tropical-house and a space to be wholly set apart for the Mangosteens, in which bottom-heat of from 80° to 90° could be maintained by means of hot-water tanks running alongside the tubs in which the largest plant was growing, and the soil in which another was planted out. An atmospheric temperature, ranging from 65° to 90°, was at the same time kept up together with a continual supply of fresh air from cold air drains which crossed the house, and discharged themselves amongst the hot-water pipes at the back, on which water in pans kept continually evaporating abundance of moisture. Under these conditions, and by means of shading in bright weather, and giving plenty of water when the plants were growing, they made a most vigorous growth two years ago, since which time they have apparently been preparing for flowering, having only made one growth in a season with much shorter-jointed wood and smaller leaves, and the shoots which have now produced flowers have remained stationary since last October twelvemonth. The first flowers expanded on the 18th of November last; the petals fell off the following day, and the fruit, which almost immediately began to swell, is now the size of a Greengage Plum, with every appearance of arriving at perfection. At the present time there are four fruit swelling, and one flower has been taken off for botanical examination. The plant is about 15 feet high, 9 feet in diameter, and the stem 6 inches in circumference. The flowers were about 2 inches in diameter, and the petals brownish red shaded with yellow."

Whether these fruits will prove to have really set is uncertain. When the flowers expanded the anthers appeared to be destitute of pollen; a camel hair pencil was, nevertheless, drawn carefully among the anthers, and then applied to the stigma, in the hope that a few particles of pollen might lurk among the anthers, although invisible to the eye. Possibly this was the case; possibly the fruit was set before the flowers expanded; possibly the fruit may still drop off. But, in the meanwhile, we are informed that it presents no symptoms whatever of being otherwise than in the most perfect state that could be desired.

WE perceive with great sorrow among the announcements of deaths at Scutari that of LIEUT-COL. JOHN GEORGE CHAMPION, of the 95th Regiment. It is not because our gallant friend is thus early lost to the profession he adorned (he was only 39) that we advert to the melancholy event, but because of the important services he rendered to systematical botany. While stationed in Ceylon he formed extensive collections of the plants of that island, in connection with the late Mr. GARDNER; and a memoir which he published on *Hyalisma*, &c., evinced the attention he had even then paid to this his favourite pursuit. His regiment having afterwards proceeded to Hongkong, Captain CHAMPION employed himself so sedulously in investigating the botany of that singular island that he speedily reaped a most abundant harvest of novelties, among which was the magnificent *Rhodoleia*, called *Championi* by Sir W. HOOKER. The herbarium which he then formed was of the highest scientific importance, as the result of its careful examination by Mr. BENTHAM published in the "Journal of Botany," abundantly shows. Upon arriving in the Crimea he was present at the victory of the Alma, to the gaining which Major CHAMPION and his glorious 95th greatly contributed; in the affair of Oct. 26, we again hear of him leading on his hardy soldiers in pursuit of the Russians almost up to the defences of Sebastopol; and finally in the heroic battle of Inkermann Major CHAMPION and the

95th were again foremost in that wonderful defence, which paralysed the Muscovite army, and saved the allied forces from destruction. It was here he fell, at the head of his men, dangerously wounded. For his gallant conduct on that occasion he was promoted to the rank of Lieut.-Colonel, which alas! he only received to surrender with his noble spirit. It is not his family alone which mourns the loss of the gallant soldier—science also must bow her head in sorrow for his fate.

An advertisement having appeared in our columns respecting a new esculent root called Dioscorea japonica, it seems desirable to state what has up to the present time been ascertained respecting the plant. In the *Gardeners' Chronicle* for the 22d of July last, an account was given of a newly introduced hardy Chinese Yam called Dioscorea Batatas, by Prof. Decaisne, which is identical with this *Dioscorea japonica*, a name that, according to M. Decaisne, belongs to a very different species, and must therefore be abandoned.

Since the appearance of the account alluded to, a couple of plants were received by the Horticultural Society, and placed under the care of Mr. Thompson, who however failed in inducing them to form tubers. Others have been more successful, especially M. Pépin, who in a late communication to the Imperial and Central Agricultural Society of France, gives the following interesting account of his experiments:—

"This plant arrived in a very bad state, nearly all the roots having been destroyed by the fermentation which had taken place in the box during the voyage.

"After the pieces of the roots which were sound had been cleaned and dried for three days, they were planted in well-drained pots filled with sandy peat, mixed with about one-fifth of rotten dung so far decomposed as to be reduced to the state of mould. The pots were plunged in a hot-bed, not covered by a frame, in order that vegetation might be accelerated by a gentle and steady bottom-heat; at the same time water was very sparingly given.

"At the end of a fortnight, by the aid of this artificial heat, fibrils and young stems had been developed. The plants were then taken out of the pots and planted in the open ground, in the end of May; a few were planted on an exhausted hot-bed, in order that they might take root more readily, and produce a greater number of roots and stems. These means succeeded perfectly well, and we were enabled to preserve and propagate the plant. The roots taken up in the autumn of 1850 were put into a cellar where the frost could not reach them; and, having kept well through the winter, they were planted out in the spring of 1851, in well pulverised, deep garden soil. The growth of the plants was very vigorous, and the roots attained a large size; one of them, measured in the autumn of 1851, was about 3 feet in length; its form was cylindrical and tapering.

"The stems of this plant wither every year in the end of October. The first year they were cut off soon after, and the roots taken up under the impression that they had been injured by frost. The roots were in a growing state when taken up, and this led me to suppose that they might have been left in the ground till the end of November, and that they would have attained a still greater size. I have observed, up to the present time, that the tubers were simple, and had no tendency to ramify; but I have also seen two together, of equal size, that grew from the lower part of the terminal shoot, and had their origin from the same point.

"In August, 1851, before the stems of that year were fully matured, some young shoots were taken for cuttings. They were cut in lengths of between 4 and 5 inches, and horizontally below an eye. They were inserted in pots filled with peat, and placed on bottom-heat in a hot-house, covering them for several days with a bell-glass, so as to completely exclude the air. These cuttings succeeded perfectly well. At the end of a month they had made a sufficient quantity of roots to admit of their being potted singly in 3-inch pots. They were kept in a hot-house, where they continued to grow till December. They had then pushed to the length of from 12 to 14 inches. Up to the present time cuttings made during summer from the herbaceous shoots have only yielded tubers after the lapse of from 14 to 16 months; but those raised from pieces of the roots produced tubers which could be used in the same year.

"It was doubtful whether the roots of this plant would withstand our winters, although some small pieces that were left in the soil when the roots were taken up in 1852 remained alive all winter, and made shoots 13 to 19 inches in length during the ensuing summer; and the roots of one of these plants were as much as 14 inches deep. The roots which remained in the ground throughout the winter pushed their shoots about the 15th or 20th of April; those roots, on the other hand, which were planted in April did not exhibit shoots till the end of May, or more frequently not till the beginning of June. There is no longer any doubt as to the hardiness of the plants; they have withstood, as I have already stated, the 25° of frost which we have had this winter, and when taken up the skin was smooth and fresh, and the roots altogether were in a sound state, as M. Brongniart, who was present, can testify.

"I preserved a root in a cellar from October, 1852, to the 30th May, 1853, without any appearance of the development of shoots. It was unchanged, and had not lost weight. I think the tubers may be kept nearly throughout the year, which is not the case with either the common or the sweet Potato.

"In June, 1853, after having been seven months out of the ground, a root of this plant was analysed, in order to ascertain the amount of nutritive matter which it contained. The following was the result in 100 parts:—

Water	70.40
Starch	18.30
Alkaline phosphates (ashes) ...	0.78
Albuminous matter (a large quantity), saccharine matter (trace), cellulose, mineral substances, &c.	10.52
	100.00

"The proportion of starch was determined with the greatest possible care, but the quantity analysed was very small (463 grains); it would therefore be necessary to repeat the analysis with a greater quantity of the root.

"In a few years we shall know to what extent the roots left in the ground will acquire weight and bulk, and how long they may remain in the soil without deterioration of quality. We know, however, that a tuber taken up at the end of three years had its cellular tissue healthy to the centre, where it was also neither hard nor woody.

"From these facts I believe that this plant will be admitted among our cultivated tuberous species, and I am also led to conclude that it will be useful in an agricultural point of view, inasmuch as it remains several years in the ground like the Jerusalem Artichoke, requiring after planting little or no cultivation, and finally that it will furnish, at all seasons of the year, an aliment within the reach of every one."

This report appears to establish the fact that the roots of the Chinese Yam are hardy and productive enough for garden cultivation. Of their quality we can speak from personal knowledge, a portion of a full-grown tuber having been obligingly sent us by Mr. J. Henderson, Kingskerswell, S. Devon, in whose hands, we understand, is the whole saleable stock of the plant. Boiled like a Potato it proved extremely good, with rather a nutty taste, but it did not become mealy, although the Potatoes which were cooked with it were perfectly so; from which we infer that the roots require to be either steamed or roasted, if to be brought to table in perfection. At all events, it is certain that the Chinese Yam belongs to the first class of garden root crops. Experience only will teach the best way of cooking it, and, we may add, of cultivating it also. Upon the latter important subject we have the following practical directions from Mr. Henderson:—

"The manner in which the Chinese cultivate it is extremely simple. The earth is first formed into ridges, when small tubers, or portions of large ones, are planted on the top, at about 3 feet apart; after the plants have attained a little strength, the shoots are spread over the sides of the ridges and pegged down at the leaf end, 6 or 8 inches from each other (care being taken to cover the joints or parts pegged down with a portion of earth), when they soon strike root and throw out tubers; by this means, immense quantities of roots, of the size of early-framed Kidney Potatoes, are raised on a comparatively small piece of ground. The above is the ordinary Chinese mode of culture; but to obtain them of a large size, small tubers, or portions, are planted on ridges, from 10 inches to 1 foot apart, and the plants are allowed to grow freely till late in the autumn, when the foliage is cut away and dried, or partially dried, and given to cattle; the tubers by this means attain on an average 1 lb. and upwards in weight. The produce, when the ground is required for other purposes, is taken up and stored away for the winter and spring; and it seems a peculiarity in this root, if exposed to the frost, it is not injured by it, nor does it have any inclination for sprouting till the natural season for planting."

Mr. Henderson further states—

"That he finds a much quicker way of procuring a stock of young tubers for seed by growing them in a cold frame, or on a gentle hot-bed, and taking the cuttings as soon as they appear; it being only necessary to cut off a leaf, with a small piece of wood without a joint, which is inserted in the mould (ordinary cutting mould) to the leaf—a pot of 6 inches diameter would contain about 50 cuttings—the pots should then be placed in a gentle heat, and kept close, either by means of bell-glasses or otherwise. Before the cuttings strike root they will throw out small tubers on the surface of the mould (similar to those sent out to the public); as soon as they are the size of a Pea they should be hardened off, and planted out thickly in the open ground, when many of the large ones will be fit for use the same season, if required. A good gardener, with a stock of 50 small tubers, ought to obtain from two to three thousand roots fit for the next year's seed."

There can be no doubt that the plant deserves the immediate and serious attention of all gentlemen's gardeners.

VEGETABLE PATHOLOGY.—No. LI.

229. *c. Doubtful or conjectural.* Though many of the causes of disease in the vegetable world are known, and even the manner of their operation ascertained with tolerable accuracy, it is quite impossible, in so difficult a subject, to obtain satisfaction on every point. There is, however, a concurrent tendency in the human mind to seek a cause for everything, and at the same time to rest contented with mere words, which give no solution of the difficulty, or with assertions which do not rest upon a single fact. How often, for instance, as regards diseases to which man is subject, is every inquiry silenced by such a word as neuralgia, which in reality only expresses the very fact under consideration without any attempt at assigning a cause. And the case is just the same with the diseases of the vegetable world. The mouth of the vulgar is stopped by mere "words without knowledge," while the person who uses them perhaps plumes himself on his superior insight into the secrets of nature. Thus, for example, the diseases which have of late been so prevalent amongst our more valuable objects of cultivation, have been asserted to arise from some unknown cause, distinguished by the name of blight, which, though not derived from a Greek fountain, like the favourite neuralgia, equally evades inquiry by the substitution of a name: or, on the other hand, some conjectural cause has been assigned, like that of electricity, without a single fact to render it probable. It is far better, under such circumstances, to confess our ignorance than to blindfold our own eyes, or those of others, by unmeaning phrases or by unsupported conjecture; because the tendency of such attempts is to discourage experiment or to mislead it.

230. The word blight, with numerous synonyms, was at one time supposed quite sufficient to account for every disease, though perhaps as many distinct causes as there are synonyms might have been at work, and these capable of being ascertained and sometimes remedied by a little close attention and common sense. The fancies of equivocal generation are merely the substitution of conjecture for observation, with a view to meet difficulties which perhaps may never be entirely cleared up. But the truth is that, after all, we are not the least nearer to the solution of difficulties under such a supposition, for, allowing the truth of the theory, we have still to discover what it is which gives the tissues or their contained fluids the tendency to produce those organisms which pass under the common name of blight or some of its equivalents. If we can ascertain the different conditions under which intestinal parasites exist and are developed, we shall have obtained important information which may lead not only to their suppression when formed, but to their entire prevention; while a conviction that they arise spontaneously will at once prevent the acquisition of such information. It cannot, therefore, be impressed too strongly upon the minds of Vegetable Pathologists, of every degree, to divest themselves of all such vanities, and to track nature herself into her secret recesses. In such a case, supposing even that notions should be prevalent as to the degeneration necessarily due to reproduction from repeated division of an individual stock, or to any other conjectural cause, however untrue or insufficient, they will be supported by well-ascertained facts, and not by mere assertion; and if so light will be elicited illustrative of some point of interest, though possibly not of the particular matter under consideration. Mere theory is too often deceptive, and by itself for the most part deserving of little consideration, whereas the wildest conjectures, if tested experimentally, may lead to the acquisition of useful knowledge. When it is asserted, for instance, that the seasons have changed, that the contents of the atmosphere are altered by the excessive consumption of fuel induced by the use of steam, that the electrical condition of the earth is different, or any other similar fancy, it is clear that as mere assertions they are valueless, but if such conjectures lead to a close examination of the several phenomena, information of the most important nature may possibly be obtained. *M. J. B.*

VINCAS.

Most amateurs possess two or three kinds of Vincas, but very few seem to care any further about them than merely to keep them alive. They, however, deserve better treatment than this; for they are almost perpetual bloomers, and form when well grown exceedingly attractive specimens. They, however, require a warm, moist atmosphere while growing, and they will hardly bear removal to a cool house while in flower; they are, therefore, useless, except a warm house can be afforded them. Rather firm, short jointed, young shoots, should be selected for cuttings, inserted in a well drained pot, filled with sandy peaty compost covered with a bell-glass, and plunged in bottom heat in a close pit or frame, where, with proper attention in the way of shading and watering, they will be well rooted in the course of a few weeks. When they are observed to be rooted, expose them to the atmosphere of the house, and pot them singly in 4-inch pots as soon as they are sufficiently hardened and strong to bear the operation, replacing them in a warm, moist situation. When they get established keep them near the glass, stop the principal shoots, and attend to repotting as the roots are found to require more space. They will, probably, not be of sufficient size the first season to be worth notice for flowering, but if propagated early in the season, they should form nice little plants, with several strong, well-ripened shoots before winter. Place them near the

glass in a house where the temperature may average from 50° to 60°, and give water sparingly to the soil in winter. Towards the beginning of February remove them to a warm, moist atmosphere, pruning and tying out the branches, so as to secure compact growth; and when they start into growth examine the roots and shift into larger pots as may be necessary to afford the roots free scope. Maintain a moist, warm atmosphere, keep the plants near the glass, and stop the shoots, keeping them nicely tied out; attend to potting as may be requisite until specimens of the desired size are acquired, and with plenty of warmth and moisture, and attentive management, large plants may be grown in the course of a few months. While in flower the best situation for them is a kind of intermediate house, rather warmer and moister than the ordinary greenhouse, but not so hot and damp as the stove, and if they can be afforded a situation of this kind they will furnish a long succession of their pretty blossoms. After wintering the specimens, as recommended for last season, prune the shoots pretty closely before starting them into growth in spring, cutting out those that are weakly or ill-placed, and when the buds start into growth, the plants should be shaken out of the old soil, disrooting them freely in order to allow of repotting them in smaller pots in fresh soil. Keep them close and warm, and sprinkle over-head frequently with the syringe, but give water to the soil sparingly until the plants appear to have made fresh roots. Stopping may be continued as long as it may be desirable to increase the size of the specimen, attending also to shifting as may be necessary for the same purpose, but observe not to repot directly before or after stopping as the roots sooner strike into the fresh soil when the plants are in free growth. Specimens that are allowed to bloom early in the season, may, in the event of their becoming shabby by July, be slightly cut back and placed in growing circumstances, where in the course of a month or five weeks they will be covered with flowers again. See, however, to having the wood rather firm before winter in the case of specimens intended for early work the following spring, and allow them a rest of some two months.

The best compost for the growth of the Vinca is about equal parts of turfy loam, peat, well-decayed leaf-soil, and thoroughly decomposed cowdung, but the latter had better not be used for newly-disrooted plants, and it will be as well left out in the case of young plants. The plants require a very liberal supply of water while in free growth, therefore secure efficient drainage, and add a good sprinkling of clean sharp sand to the compost. —*Alpha.*

NEW FRUITS.

Apricots.—*St. Ambroise.* This is evidently a seedling from the Large Early, and is one of the best Large Early Apricots known. In size it approaches very nearly to the Moor Park; is very much compressed or flattened; its flesh is juicy, rich, and sugary, much superior to the Large Early; and it ripens fully a fortnight before the Moor Park. The tree is remarkably vigorous and healthy, and it is a profuse bearer.—*Kaisha.* This is also an early Apricot, not so large or so early as the preceding, but follows closely upon it. Its flesh is high-coloured, very juicy, rich, and agreeable. It succeeds admirably as a pot tree for the orchard house, and bears abundantly.—*Beaugé.* This is a new variety of the Moor Park race, and has the valuable quality of ripening 10 or 12 days after it. Its fruit is large, juicy, and rich, and the tree is very hard and productive.—*Tardive d'Orléans.* This is still later than it at first appeared to be, and this season ripened in the orchard house more than a fortnight after the Moor Park, hanging on the tree till the middle of September, shrivelling and becoming very rich.—Peach or *Pêche* of the French, or *Gros Pêche.* Although the Moor Park has for many years been reckoned the standard of excellence in England, this is a larger and better fruit; in fact, it is the best of all Apricots, and often confounded with the Moor Park. Its leaves are larger and more round; its buds are more prominent than those of that variety, and one great difference exists, it will not grow when budded on the same plum-stock as that used for the Moor Park. Its habit is most robust, and it bears profusely either as a wall tree, or in pots in the orchard house.—*Alberge de Montgamet* is a small but useful and agreeable early Apricot either for the wall or orchard house.

Cherries.—The *Belle Agathe* Cherry, figured and described in the "Album de Pomologie" as a full-sized sweet and good variety, hanging on the tree till the end of October, proves to be no better or larger than Tardive de Mons, a small hard late Cherry. Some American Cherries, raised by Dr. Kirtland, of Ohio, have proved of great excellence. Of these Governor Wood, Rockport Bigarreau, Cleveland Bigarreau, and Ohio Beauty, are the best.

Currants.—*La Versaillaise, La Hâtive,* and *La Fertile,* three varieties comparatively new, are well worthy of cultivation. The first is the largest Currant known, larger even than the Cherry Currant; its bunches are very long. The second and third are well named, for La Hâtive is as early as Knight's Early Red, but with berries much larger, and La Fertile is a most prodigious bearer, so that its leaves are hidden by its fruit. Transparent White proves a most excellent sort. Its fruit is more amber-coloured than any other white Currant.

Peaches.—The American Peaches, hitherto thought lightly of in this country on account of our climate being too humid for them when cultivated on walls in the open air, are of the highest excellence in the orchard house. *Scott's Early Red,* ripening about the middle of August, and *George the IVth,* ripening the second week in September, were this season juicy, vinous, and rich beyond any other varieties; the Early York was also very good, and the large Early York equal to George the IVth. A new late Grosse Mignonne Peach (*Mignonne grosse tardive*), gained by Monsieur Lepère, of Montreuil, from a sporting branch of the Grosse Mignonne, is a most excellent variety. It ripens a fortnight later than its parent, and is equally good. *Monstrueuse de Doué,* a seedling raised from Reine des Vergers, is a new French variety, like its parent in excellence of flavour, but very large, and more deep in colour than most Peaches. Its skin is entirely of a deep crimson. The *Angers Large Purple* Peach is one of the largest and finest of Peaches, and ripens about the same time, or rather just after the Chancellor, forming a capital successional Peach. Gregory's Peach, raised from seed in Gloucestershire, is a very hardy late Peach, melting and very good; it closely succeeds the Late Admirable, and is a most abundant bearer. All the above are freestone melting Peaches of first quality.

Pears.—*Beurré Clairgeau.* This large and very handsome Pear was not of first-rate quality last year, which was imputed to the cool moist season; but this season it has also proved of inferior quality, its flesh tender and juicy, with a slight perfume, but flat and watery, and very inferior to that standard of perfection in autumn Pears, the Marie Louise.—*Bergamotte Dussart.* This, a medium-sized Pear, ripening in December and January, is a most delicious melting Pear, with a peculiar aroma; it is hardy, and ripens well as a pyramid, but does not appear to grow very freely on the quince stock. —*Prevost.* This very handsome and prolific variety requires a warm soil and situation as a pyramid; it is not melting, but becomes soft late in spring, and has a highly perfumed flavour.—*Prince Albert* (Van Mons). This is a variety likely to be very valuable; it is in shape like Beurré Rance, and usually keeps longer, often till April and May, which that variety rarely does; its flesh is half melting, juicy, and rich; the tree is very hardy, and grows well on the quince stock, and will form a handsome prolific pyramid; it may be planted against walls with S.E., E. or W. aspects with advantage. Trees are now 5*s.* each.—*Surpasse Crassane* (Van Mons). This is the Crassane in quality and shape, which is enough. No finer Pear has ever yet been raised than that old favourite variety, large trees of which may often be found in the gardens of our old country mansions, bearing Pears few and far between. The habit of this seedling Crassane is very vigorous and healthy; it grows well on the quince stock, and seems inclined to bear well as a pyramid or bush, and also well deserves a S.E. or E. wall.

Plums.—*Belle de Septembre.* This proves to be a useful variety. It is large, oval, of a bright red colour. In England it does not ripen till the middle of October, and is a very hardy, excellent kitchen fruit.—*Cloth of Gold* (Esperen) proved this season of excellent quality from a S.E. wall. Shape, roundish oval; colour, bright golden yellow; size, as large or larger than the Washington, and very juicy and rich. It ripened just before Coe's Golden Drop.—*Diamond.* This large and magnificent Plum cannot be too highly recommended for preserving or kitchen use; its agreeable acid is never killed; and it is quite equal, if not superior, to the Winesour of Yorkshire, and, like that well-known variety, it is a most disagreeable Plum to eat.—*Frost Gage.* This should be called the American Damson, as it is a Damson in every respect, and the best of all. Its fruit is round, or very slightly inclined to oval; of a deep purple; will hang on the tree even to the end of October, and is always brisk in its flavour, juicy and agreeable. It bears most profusely either as a standard or pyramid.—*Prince Englebert.* This is a Plum from Belgium, of the same race as the Diamond; of the same deep purple colour; but in a tart it is more sugary. It forms a handsome pyramid, and bears abundantly. It ripens about a week before the Diamond Plum.

Raspberries.—The *Black Raspberry* proves to be a most distinct and useful variety; its brisk acid serves so well to correct the cloying sweetness of jam made of the common sorts.—The *Belle de Fontenay* is a dwarf-growing variety, with large and deep-green leaves. It bears large fruit all the autumn, of good flavour, but requires a warm soil and exposure.—The *Merveille de Quatre Saisons* is, of all the autumnal Raspberries, the most abundant bearer. Its spikes of fruit are often 2 feet long, and produced till the end of October. The Merveille de Quatre Saisons is a new variety raised from the above. It bears abundantly in the autumn, and its fruit is sweet and well flavoured. *T. R.*

Home Correspondence.

Grafted Rhododendrons (see p. 758).—I shall be happy to be convinced of my error, if such it be, on the subject of grafted Rhododendrons. There is, however, nothing in the statements of your correspondents which as yet gives me reason to alter my opinion. I was so dissatisfied with the appearance of the grafted plants offered for sale in the nurseries of my own neighbourhood, that I took a journey last summer, on purpose to see whether finer specimens existed in the large American nurseries, where I recollect most magnificent plants of the older Rhododendrons some 30 years ago. My visit was one of complete disappointment. I saw thousands of plants, all apparently grafted, and all starved and unhealthy looking. In a large collection I do not recollect that I saw one really fine healthy-looking plant, such as I am used to see on their own roots in private gardens around me. I much regret that I did not visit Mr. Waterer's, and if I live till the summer I hope to remedy the omission. In the meantime I observe Mr. W. states that he has Rhodendrons grafted upwards of 25 years, which are from 8 to 10 feet in diameter. Now to my apprehension he could hardly give a stronger proof that his Rhodendrons are dwarfed and stunted by grafting. Even the common Ponticum in the favourable soil of Bagshot would have attained greater size in the same time, much more the strong growing hybrids of Indian parentage. I have this summer seen some Indian hybrids certainly not more than 25 years old, which are 15 feet high, and at least 25 in diameter. My own plants, not more than 10 years planted, and checked by three removals, vary from 8 to 10 feet in diameter; there are others in my neighbourhood of similar growth, and I am persuaded that Mr. Waterer's plants, had they not been grafted, would have been double their present size. From what I have observed of the habits of hybrid Rhododendrons, I conceive an Indian hybrid grafted on R. ponticum is precisely in the condition of a strong growing Apple on a Paradise stock, with the effect of which every gardener is familiar. I may be mistaken as to their probable duration, but I believe experience has shown that Apples on Paradise stocks are not durable, especially the strong growing kinds, and I know that grafted Rhododendrons require constant attention to prevent the stock throwing out shoots, and starving the grafted plant, which would soon destroy it. The question seems to resolve itself into one of the stature and growth of Indian hybrids. I do not speak of the varieties raised between R. arboreum and the dwarf varieties, R. dauricum and R. caucasicum, &c., because these may naturally be expected to be of smaller growth than R. ponticum, and may flourish if grafted on it; but I speak of the hybrids, with R. catawbiense, maximum, and ponticum, all of which are large shrubs, especially R. maximum; and these crosses with arboreum may be expected greatly to exceed the stature of their parents, and as far as my observation goes, they do. And I contend, that all these hybrids are checked in their growth if grafted on R. ponticum. R. maximum would be a better stock, especially the variety R. arborescens; but these are comparatively rare plants, and I have no reason to suppose that these are used as stocks, and even if they were they are still of smaller growth than the hybrids. With respect to grafted plants forming independent roots if planted sufficiently deep, I shall be glad to find it the case; perhaps with very young plants it may succeed. I have tried the experiment with one or two rare varieties, which were doing ill upon stocks, but the experiment was altogether unsuccessful, and the plants died. I regret I cannot comply with Mr. Fraser's request to name the varieties I possess, because those to which I refer are, as far as I know, unnamed seedlings. Some which have been in my possession upwards of 10 years, and are probably from 15 to 18 years old, have not flowered; others only flowered last year for the first time, and it is to one of these that I referred when I quoted it as equalling catawbiense in size, and arboreum in colour. It was mistaken last spring, when in flower, for R. arboreum by a friend recently returned from the Himalayas; and in foliage it closely resembles R. arboreum. It is quite hardy, as last spring proved. My seedlings are of different batches; some approaching nearer to catawbiense, some, I believe, showing R. maximum parentage, and many clearly hybrids of ponticum—these are by far the smallest in growth and habit. In conclusion, I do not wish to deter nurserymen from propagating some hybrid Rhododendrons by grafting, but I do desire that purchasers should have a choice of laid as well as of grafted plants. Those who desire compact plants and immediate effect, can choose the latter; those who wish to have the natural habits of the plants in full luxuriance will probably prefer the former. I am principally anxious that our gardens should not be deprived of the ornaments anticipated for them by one of the first (if not the first) and most zealous of hybridizers, "that the stature of the hybrids would be increased by the intermixture with R. arboreum." Such has unquestionably been the case, and if 30 years has sufficed to produce American Rhododendrons at Embley, "50 feet in diameter and 20 feet high," there is no reason whatever why the Indian hybrids should not attain still greater size in less time. I would add one remark: I find that the hybrid Rhododendrons root much deeper, and make much larger and stronger roots than the American or pontic varieties. So obviously is this the case that I believe they might almost be distinguished by their roots alone, and they require to be removed with very large balls. *J. R.*

Kohl Rabi.—Increased importance being given in the present age to the products of the kitchen garden by the progress of vegetarian habits, the following remarks are offered on a vegetable which is not so much known as it deserves. The plant meant is the Turnip-Cabbage, Nol-Kohl or Kohl Rabi. My first acquaintance with it was in India, where the seed is brought from the Cape of Good Hope; and I subsequently saw some excellent produce from seed sent to England by a missionary from the same quarter. I have also had seed from Hamburgh, but the produce was not remarkably good. There is scarcely a seed shop in London from which the seed is not to be procured; and the produce has been of nearly equal quality. On making inquiries from an agricultural friend, I ascertained that particular attention had been given to the cultivation

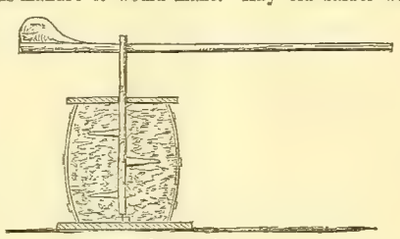
of the plant by the Messrs. Sutton, of Reading. They grow no great quantity, being only for seed to private gardens in their neighbourhood; but they profess to take great pains in the selection of kinds. They recommend their green and their purple, and the price is stated to be 3s. a pound, from which an estimate may be made for writing for small quantities to be sent by post. It is dangerous to presume on tastes; but to a certain extent prices confirm. The dearest, and therefore probably the most valued vegetables, are Asparagus, Artichokes, and, except in the height of the season, green Peas, and these are the only kinds to which the Nol-Kohl may not be declared superior. Its resemblance is greatest to the bottom of an artichoke, and the upper half is better than the lower, a fact which may be turned to advantage without waste, where there are cattle to consume the rejected halves. It is recommended to sow in February, or as early as possible, and monthly afterwards till the end of May. The bulb should be used before it arrives at its utmost growth, as afterwards it grows what is called strong. It is better to avoid transplanting, as the plants grow irregularly afterwards. *A Vegetarian, Dec.* 11.

Protections for Glass-houses.— Would you be kind enough to give me your opinion on the following point. I wish to protect a span-roofed house, 20 feet wide; I was thinking of using frigi domo—can you tell me, 1st, whether it has been found to answer the purpose? and, 2d, whether a covering hung up under the rafters inside the house would keep out the frost as well as if it was outside? There have been several articles on the subject of coverings for pits in your paper lately; I have never found anything so satisfactory as the following: make a light deal frame, the same size as your light, in this way; on this nail some roofing felt, and give it a coat of tar, sprinkling sand over it whilst hot; this is always dry—leaves a space between the glass and the covering, and keeps out more frost than two or three mats; in addition to this, it is durable. My coverings are several years old, and to all appearance they are as good as new. *Adonis, Bentley, Dec.* 18. [Experience confirms the good qualities of frigi domo.]

Orange Trees.— Judging from your correspondent "A. M. D.'s" remarks respecting his Orange trees (see p. 806), I can perceive that he is in the same fix with which I have contended for these last three years, viz., having Vines, Orange trees, and plants all in the same house, an occurrence too often to be met with in small establishments. When Orange trees are taken under protection for the winter they should have all the light and air which it is possible to give them, in order to keep them in a dormant state during the winter months. In spring start them slowly into growth with the returning light and heat of the season, in order to give them a strong robust constitution, so as to be able to bear the refreshing breeze, the genial showers, and the powerful sunlight of summer. But how is this to be done when they are under the same roof with Roses, Azaleas, Hyacinths, Primroses, and other conservatory plants which require a milder temperature. One or the other must suffer, and so it is with "A. M. D.s" Orange trees. They "broke out all over afresh" at a season when they should have been at rest. It was, however, wrong to water them with liquid manure in summer, when they were in a sickly state; pure soft water was sufficient until they regained strength. As, however, they are well drained and growing in good compost, with proper treatment they will soon recover. *W. Fitzsimon, Reigate.* ——About 25 years ago I had under my care about 12 or 14 Orange trees, each as much as four men could lift in the same state as "A. M. D.'s." I washed the wood all over with soft soap, using long small brushes to get among the small branches. I employed no more soft soap than was necessary to cleanse the wood. I allowed the lather of the soap to run on the mould in the tub, and when the trees were syringed it was washed into the soil. This put new life into the trees, and they became the handsomest I ever saw, and never afterwards cast their leaves. Soap-suds doubtless make good dressings for Orange trees. My trees were kept in one of the old-fashioned Orange houses. *J. H.*

Vegetation of the Crimea.—In the first part of Dr. Clarke's travels in various countries of Europe, &c., are several chapters wherein the details of the author's journies in the Crimea are given. In some of these journies, too, the doctor was accompanied by Prof. Pallas. The descriptions of Inkermann and of Balaklava (of the harbour of which town an engraving is given), possess great interest at the present moment, while an appendix containing a list of the plants gathered in the Crimea may also be serviceable to a botanist. Scattered throughout the book there are allusions to the vegetation of the country, which are interesting in reference to certain articles that have lately appeared in the *Chronicle* on this subject. In speaking of the "principal spontaneous vegetable productions of the rocks and mountains upon the south coast of the Crimea," he mentions the wild Sage as "growing, in some instances, to such a size as to be almost considerable enough to rank as a shrub." The black Date (? what is meant), the Pomegranate, the Olive, and the Fig tree, are said to "flourish along the coast as in the south of Italy." Vines are alluded to as covering the porticoes of all the doors in Balaklava, and as growing so rapidly that in two years one Vine yielded two bushels of Grapes. The mountains as well as the plains are mentioned as being "thick set with Oak, Wild Pear, Crab, and Cornelian Cherry," while the villages are overshadowed "by an exuberant vegetation of the Walnut, the Mulberry, the Fig, the Olive, the Pomegranate, the Peach, the Apricot, the Plum, the Cherry, and the tall black Poplar. The Crimean Water Melon is said not to attain half "the size in which it is seen at Naples, but the flavour is nearly as fine; while at Cherson, which is more to the north, it grows as large as in Italy." The flora of the south of the Crimea, judging from the plants enumerated in the above-mentioned appendix, as well as from specimens from Compère and others deposited in the Fielding Herbarium, would appear to resemble to a considerable extent that of the Archipelago, especially in the prevalence of species of Cistus, of Salvia, and of other southern genera; but it is in the sheltered valleys that the luxuriant vegetation described by Dr. Clarke occurs; elsewhere, and especially to the north, so different is the aspect of vegetation, that "the narrow tract of cultivated land on the southern coast may be compared to an edging of lace on the lower rim of a large apron." *M. T. M., Botanic Garden, Oxon.*

Substitutes for Coal.—Coals are very dear; bread is very dear, allowing less money for firing; why should not Barley awns, but especially sawdust, be mixed with clay, as they do small coal with clay in South Wales? In our country both sawdust (except a little screened deal) and Barley screenings are utterly wasted; old thatch would mix with clay; all of these would be more readily mixed in an old mortar pug. I intend trying some sawdust. Peat-dust is of no use to burn; but if mixed with clay, it would do very well, and what glorious manure it would make. Any old barrel would

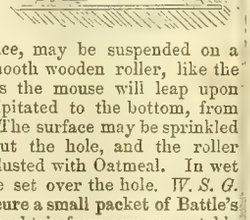


Section of Pug.

serve for a pug, with a board at the top and bottom to let the spindle work in. *Somerset.*

Weather in Buckinghamshire.—I see by the weather table in your paper for the week ending Nov. 30th, that the thermometer at Chiswick did not register more than 6° of frost on the night of Nov. 26th and morning of the 27th. At this place the cold was remarkably severe, the thermometer registering no less than 23° of frost, going down to 9° Fahrenheit. The instrument (a self-registering one) was placed on a low terrace wall, about two feet from the ground, on the south side of the house, and protected from cold winds. All bedded out plants were killed, except a few scarlet Verbenas, and some young strong plants of Mignonette. Cinerarias, in a greenhouse without fire, were struck by the frosts but were not killed. *H. B., Wavendon Rectory, Newport Pagnell.*

Crocus Beds and Mice (see p. 806).—With reference to the inquiry of "F. R. S.," I beg to suggest that he might try the trap for mice recommended in M'Intosh's "Practical Gardener:"— "Take a large flower-pot, invert it on a board or slate, and sink it in the ground, nearly level with the surface. Opposite the hole in the bottom of the pot, and about 2 inches from the surface or entrance, may be suspended on a crooked piece of wire a smooth wooden roller, like the caster of a bed-post; this the mouse will leap upon and from thence be precipitated to the bottom, from whence it cannot escape. The surface may be sprinkled with chaff and seeds about the hole, and the roller smeared with lard and dusted with Oatmeal. In wet weather a ridge tile may be set over the hole. *W. S. G.* ——If "F. R. S." will procure a small packet of Battle's vermin killer, which he can obtain from any respectable chemist, and spread the powder thinly over a small piece of bread and butter, and place it on his beds, I will guarantee that it will destroy all the vermin in a few nights; for the moment they eat it they die. *E. Bennett, Perdiswell.*——I find that Whins (Gorse) chopped small, and sprinkled over the roots of Crocuses, are very effectual in preserving them from mice. The Whins should be pressed down so as not to blow away. *A. Z.* ——The simplest garden mousetrap is the following: Take a handful of Beans, soak them in water until soft, string them on a stout thread, one bean on each end; tie each end of the thread to a peg, and thrust the pegs into the ground at the distance apart of the width of a brick; rest a brick on the ground and across the string, so that the Bean shall be as nearly as possible in the centre of the brick, which should stand at an angle of 45°. The mouse in gnawing the Beans cuts the thread, the brick falls and crushes it. These traps set where mice frequent gardens will soon destroy them all. *G. W., Bushey.*



Peach Trelliscs and Pampas Grass.—I have read, with much interest, in your Paper of December 2d, the remarks made upon Mr. Bellenden Ker's method of training Peaches on trellises under garden-frames. Since that time I have also seen the statement, that all the plants of Pampas Grass in the country have been propagated from two plants raised in Ireland by Mr. Moore. This leads me to ask if you can explain the reason why, in the garden of the Horticultural Society, the attempts to imitate Mr. Ker's gardener on the one hand, and Mr. Moore on the other, have so signally failed. *D. R., Dec.* 11.——[The cause of failure in the Peach-frame above alluded to was explained in the Journal of the Horticultural Society, vol. vii., p. 234. *R. Thompson.* ——The splendid plant of Pampas Grass which has been the admiration of every person this autumn in the Society's Garden, would not have been so if it had been cut to pieces and mutilated for propagation. *G. Gordon.*]

Pampas Grass.—I got a plant of this in July, 1853, not rooted separately, and I was afraid that it would not take with the ground before winter. It, however, did so, and stood out all last winter (it was like a small leek when I got it), and it has grown during the summer to a good-sized bunch with leaves about 3 feet long, and now (Dec. 12) quite green; there were two or three stems like flower stems, but being a young plant they did not come to anything. I intend to propagate it next season. *John Hutchison, Monyruy, Buchan, North-east of Aberdeenshire.*

Old Pear Tree.—The inclosed Pear has been in cultivation in the garden of Sir Gilbert Heathcote for at least 100 years. Can you tell me what is its name? The specimen is an average sized one. *M. J. B.* [The Pear is the Nutmeg, or Bezy de Caissoy, a very nice variety.]

Grape Growing.—In answer to the inquiry of a Grape grower (see p. 806), I beg to say that the varieties grown by me which exceeded 6 lbs. were the Cochin China and White Nice. I have also had bunches of Muscats, Black Hamburghs, and West St. Peters, weighing from 3 lbs. to 4 lbs. each. When I mentioned the weight of my bunches it was not because I considered them to be unusually large, for I was then perfectly aware of the size and weight to which the White Nice will attain. Had Mr. Bennett not alluded to the weight of my bunches in his remarks on the Vine mildew, I certainly should not have again adverted to them; it was to the cure of the mildew that my article chiefly referred; and although I stated that the bunches exceeded 6 lbs., I did not give their exact weight, for some of them were doubtless heavier than that, which, for bunches partially destroyed and rotten with mildew, is not to be despised, even in the case of White Nice. *J. W. Hall, Gaines, Worcester.*

Foreign Correspondence.

State of Horticulture in Victoria.—Now that the excitement of the great gold discoveries has somewhat subsided, horticulture is becoming an object of attention, not only as a means of affording the luxuries of the vegetable world for the tables of the wealthy, but as a means of improving the moral and social condition of the people. Up to the present time there is nothing to boast of in the gardens of Victoria, but there is much to be ashamed of. With a climate and a soil capable of producing, with so little trouble, almost all the fruits and vegetables which England, with all her "Crystal Palaces," sacrifices so much for, it does not say much for the energy of our colonists when we look at the gardens of Victoria. *J. M., Geelong, Victoria, Sept.* 5, 1854. [We should be glad to hear further from our correspondent.]

Notices of Books.

Manual of Mechanics; Manual of Hydrostatics; Manual of Optics; Manual of Plane Trigonometry. By the Rev. J. A. Galbraith and the Rev. S. Haughton. Longmans. 12mo.

Introductions to the study of natural philosophy are both numerous and in some respects good. Nevertheless, with the exception of a few books too dear to be accessible to the masses, there has always appeared to us to be wanting that which the three first of the above manuals supply, we mean a link between wholly non-mathematical treatises and those which are only intelligible to persons versed in the higher branches of mathematics. Many persons know a little geometry, a little algebra, and a little trigonometry, quite enough to enable them to understand the great principles of physics much better than they can possibly do, so long as they confine themselves wholly to elementary works, from which mathematics are purposely excluded; but there has been much difficulty felt in prosecuting the study of natural philosophy further, simply because there was no work sufficiently accessible, and suited to such limited acquirements. Messrs. Galbraith and Haughton have done much towards remedying this defect; pre-supposing a knowledge of elementary mathematics, the mode in which that knowledge can be made available in physical inquiries is shown in a series of propositions arranged with skill, and clearly stated and demonstrated. For schools and private instruction these little works appear well calculated, and their price (2s.) is such as to place them within reach of all.

Xenia Orchidacea; Beiträge zur Kenntniss der Orchideen, von H. G. Reichenbach fils. 4to. Leipzig. Brockhaus. Parts 1—3.

Under this name Professor Reichenbach, the younger, is bringing out a very useful miscellaneous collection of notes and illustrations, explaining his views of the systematical arrangement of the natural order of Orchids. No one on the Continent is so capable of conducting a work of this kind as the author; he has a very large knowledge of the subject, possesses great industry, and is provided with all the information that Continental gardens can supply; in addition to which

his cabinet materials are of considerable importance. He describes carefully, and elaborately—we think too elaborately—and in this, his own book, he escapes from the typographical errors which have made some of his contributions to German periodicals so perplexing to those who are occupied with the same subject. If he has fallen into errors here and there, the writer of the present remarks, who has sins enough of that kind to answer for himself, would be the last to reproach him. In fact, both mistakes and oversights are inevitable in so very difficult an order, especially when bad garden specimens or mere fragments preserved in herbaria are the materials upon which the botanist has to work. But this circumstance should teach all who are engaged in the branch of study in question to distrust their own judgment, to avoid criticism unless they are very sure of their own accuracy, and above all things not to dogmatise about such questions as the limits of species or genera, which after all are matters of opinion and experience, and not points to be settled by any known invariable principles.

Each number of the work before us consists of three sheets of letter-press in Latin and German, and ten plates partly black, partly coloured. Being drawn by the author the latter have the merit of expressing exactly what he intends, and this, in a scientific view, compensates for any want of artistic skill which the critical reader may remark. We observe with much pleasure, in the third part just received, that Mr. Reichenbach has commenced giving analyses of genera; and we venture to predict that, if he perseveres in this excellent course, we shall soon be able to point to him as a leader among his countrymen, who will rescue them from the just imputation that at present they too often mistake a cloud of words for a ray of light.

Garden Memoranda.

Messrs Lee's Nursery, Hammersmith.—A little Grass plot at the entrance of this nursery is always kept so neat and trim as to deserve a passing remark. During the summer months the beds which it contains are filled with some of the choicest plants for massing, among which variegated Geraniums for which this nursery is so celebrated form a conspicuous feature, and in winter they are ornamented with standard Portugal Laurels, Laurustinus, and Conifers, the latter being set on raised mounds covered with turf. This kind of arrangement exhibits the plants to good advantage, and has altogether a pleasing appearance. The centre mound contains a well grown specimen of Picea nobilis, and on both sides of the broad walk leading from this plot to the glass houses are some handsome Conifers, consisting of specimen plants of all the better kinds of this useful class of plants. Among them are numbers of thriving young trees of Araucaria imbricata, beautifully grown and in the best possible condition, varying from 4 to about 5 feet in height.

As regards plants under glass some young examples of Epiphyllum truncatum are now in full flower, while on the roof Ipomœa Horsfalliæ is in a similar condition, and the glowing Euphorbia jacquiniflora is blossoming profusely against an inside end wall of the same house. In a cool greenhouse in front of rows of small Orange trees in pots, we noticed a stageful of Chrysanthemums now in good bloom, and still maintaining a considerable amount of gaiety, in which they were assisted by Double Chinese Primulas, than which what can be handsomer at this season of the year?

Near this was an intermediate house, in which were several young plants of the Pampas Grass. These had been obtained by dividing the tussack into as many parts as had roots attached to them, potting them in light sandy soil, and plunging them in a spent tan bed, where they have rooted satisfactorily. In the absence of seeds this, therefore, would appear to be the best way of propagating this deservedly much admired Grass. On the roof of the same house Tropæolum "Caroline" was in bloom. It resembles T. Triomphe de Gand, but is scarcely so good in colour.

At each end of the Camellia-house, which is furnished with fine plants well set with bloom buds, were two beautiful specimens of standard Portugal Laurels, each measuring at least 5 feet through the head, the stems being straight and clean, and quite 5 feet in height.

In the Heath-houses several of the winter flowering species, such as hiemalis, gracilis, mutabilis, multiflora, and rubens, were in flower; and among Epacrises, of which there are large quantities of young plants here, one or two of grandiflora are even now sufficiently in flower to make a tolerable display. A span-roofed Azalea house was well furnished with promising specimens, and the same may be said of a New Holland house in which various Correas were in bloom, together with the pretty white Pimelea Neipergiana, the white Diosma ambigua, and one or two other plants; of Boronias there were many nice plants of B. Drummondi, a handsome, and we need not add, somewhat scarce species.

At the entrance of a span-roofed stove was a beautiful plant of Platycerium grande in a pot, in which it looked well, and appeared to thrive as satisfactorily as it does against a board or a wall. The pot was filled with peat soil heaped up above the rim in the shape of a cone covered with crocks, and on this the plant was set, and, as we have stated, with good effect. Associated with it was the white berried Ardisia which, although not so striking as the red kind, serves to create variety. Torenia asiatica was growing freely in pots swung from the roof, and intermixed with Orchids in baskets and on blocks its long pendulous branches well furnished with flowers had a good appearance. Among variegated plants, of which there is a good collection here, none showed themselves to more advantage than Aphelandra Leopoldi, whose bright green leaves veined with white are extremely beautiful. The variegated Pine too makes a good variety, mixed with Ixoras and similar plants. Among Orchids in bloom here was Maxillaria picta, whose fragrance quite scented the air of the whole house. Clerodendron splendens was in bloom on the roof, and on a damp shady end wall were Ficus barbata and repens, which fixing themselves to the stones like Ivy covered the whole wall with green leaves, and made a good background for Ferns, of which a small collection was arranged in front of them.

In a light wooden span-roofed house were numbers of variegated Geraniums, not only of Golden Chain, Flower of the Day, and Mountain of Light, but also of new kinds, of whose merits we hope hereafter to have a better opportunity of judging.

A small stove adjoining the propagating house contained a charming collection of variegated Orchids, and on the shelves of the latter house we remarked thriving young plants of Thujopsis borealis, Wellingtonia gigantea, and other rare Conifers, and along with them a young plant of Fuchsia Dominiana, which is found to make such a good autumn blooming conservatory plant. In another house were some very fine plants of Libocedrus Doniana and Chilensis; and here the autumn and early winter flowering Acacia oleæfolia elegans was in blossom.

Among out-door stock we noticed a good assortment of fruit trees in pots, to the growing of which, since they are likely to become an important feature in fruit gardening, many nurserymen have turned their attention.

FLORICULTURE.

Propagation of Pinks.—These often suffer in winter, from not being rooted early enough in the season. Although many persons defer propagating until a later period, yet I would not recommend it to be delayed longer than the last week in June or the first week in July. The reason for commencing thus early is obvious. Not only will the young plants form more vigorous roots before the approach of cold weather, but their blooms next season will be finer than could be produced by cuttings, which not being properly rooted would have a hard struggle to live through the winter. The most certain and expeditious method of propagation is by pipings or cuttings of the grass of the present year. Before commencing this operation a slight hotbed should be formed of leaves, or any other material, which is not likely to heat violently. Upon this a layer of the rough siftings of decayed vegetable mould should be spread, to serve for drainage, and upon the whole a mixture of fine leaf-mould and silver sand to the depth of 3 or 4 inches. This bed after being made perfectly level, and firmly beaten down with the back of a shovel should be well watered through a fine-rosed watering-pot, and in a few days it will be fit for use. In selecting the grass for pipings strong and short-jointed shoots should be chosen. The piping should be cut off with a sharp knife immediately below the second or third joint from the top of the shoot, and it may then be readily disengaged from the two leaves which surround its base, and which are commonly termed a sheath. The tips of the leaves should be shortened for the sake of convenience, otherwise when planted it will be difficult to prevent the hand-glass from resting upon them or disturbing them whenever it is removed. As the pipings are prepared they should be put into a basin or pan filled with water to prevent them from flagging before they are planted. For this and similar delicate operations the cool hours of the evening are most suitable. In planting the pipings they should be pressed firmly into the soil to the depth of about half an inch, leaving them an inch and a half apart every way, and after being properly secured they should be gently watered through a fine-rosed pot to settle the mould closely round their stems, and as soon as the leaves become thoroughly dry a bell glass should be placed over them. The glass should be pressed lightly into the mould to prevent as much as possible the ingress of air. In sunny days the bed should be shaded from 7 or 8 o'clock in the morning until 5 or 6 in the afternoon; and if there is any appearance of damp amongst the pipings the glasses should be occasionally taken off to allow them to dry, and all plants so attacked should be immediately removed. It is very probable that the pipings will not require to be watered until the greater part of them has taken root. Should watering, however, be necessary, the leaves must be allowed to become dry before the glasses are replaced. As soon as roots are formed the hand-glasses should be slightly raised on one side, and this may be gradually increased until at last they may be entirely dispensed with. The young plants after being by degrees inured to the sun may be transplanted 6 inches apart in an open bed previously prepared for the purpose, in which situation they may remain until required for planting finally in the beds where they are to bloom. *S.*

The Calceolaria being a plant very easily cultivated provided a little care is taken to keep it free from green-fly, and when well grown very ornamental, I beg to give a few particulars by which amateurs should be guided in its management. The seed should be sown in September, in a common garden-pot, and covered as lightly as it is possible to cover it. The pot should then be placed under a common hand-glass in a shady situation, where the seed will very soon germinate; as soon as the seed leaves are expanded, the tiny seedlings should be pricked out into other pots or shallow pans, and placed in a frame, keeping them shaded for a few days; after which they may be gradually exposed both to sun and air. As the leaves increase in size and number abundance of air should be given, and if green-fly has made its appearance fumigate immediately, taking care, however, that it is done sparingly and often, for the leaves are liable to be damaged when tobacco smoke is too strongly applied. In the course of a few weeks the plants may be potted off into 4-inch pots, and still kept in a frame; but as they are liable to be injured by damp in that situation, an airy shelf near the glass in a greenhouse is generally preferred for them, although I have kept them in common frames during winter, and, by the admission of plenty of air in fine weather, have succeeded admirably; they grow and flower much better in the absence of any artificial excitement. In February, or the beginning of March, they may be shifted into their flowering pots, and if kept in the frame or pit they should be placed near the glass, and little air should be given them for a week or two, until they shall have begun to grow. During their growth see that they are kept clear of insects, for on this nearly all depends. Varieties which have been cultivated the previous season, and which are esteemed for their good qualities, should be layered in the pots in which they have flowered; they will soon root, when they may be removed and treated precisely as the seedlings. The most suitable soil for the Calceolaria is a mellow sandy loam, moderately enriched with well rotted manure—that from an old hotbed answers perfectly; a sixth part silver sand may be advantageously added to the compost. This, however, will depend upon the nature of the loam. *D.*

Miscellaneous.

Germination of Orobanche.—Dr. Caspary, on the 18th of July, 1854, laid before the Berlin Society of Natural History some observations on the seeds of Orobanche and their mode of germination. The seed has an elliptico-ovate perisperm, near the micropyle of which is a suborbicular embryo containing oil, which has no trace of radicle, cotyledons, or vascular system, but consists of perfectly uniform cells. Dr. Caspary has followed out the germination in Orobanche ramosa through all its stages. The embryo is first elongated into a thread of greater or less length, which at the extremity which answers to the chalaza, is still capped with the testa. When this thread comes in contact with the root of a plant suitable for its nourishment, the radicle extremity, that has no coleorhize, penetrates through the parenchym, till it meets with a vascular bundle, from which the vessels branch into the young Orobanche, so that it forms, as it were, a ramification to the root. The Orobanche then thickens at the base, and forms radiating adventitious roots, which often become attached to their matrix by a lateral branch. The chalaza end of the embryo at length developes two opposite scale-like leaves, which perform the part of cotyledons. A second pair follows alternating with these, and the others with a $\frac{2}{5}$ arrangement. Dr. Caspary has not detected any adventitious buds on the stem.* *M. J. B., Botanische Zeitung, Sept.* 15, 1854.

Tobacco.—There is no plant, observes Professor Targioni, whose history shows so many vicissitudes as that of the Tobacco (Nicotiana tabacum). Imported from America soon after the discovery of that continent, it was received into the old world with a species of enthusiasm, and Europeans, Asiatics, and Africans began everywhere to smoke, to chew, and to snuff. It was not long, however, before some of the evils and inconveniences involved in the practice began to appear, and a host of enemies were raised up against it. Theologists pronounced it an invention of Satan, which destroyed the efficacy of fasting, a point much disputed in the 16th and 17th centuries. Councils forbade it to all ecclesiastics under their control. Popes Urban VIII. and Innocent XI. punished the use of it with excommunication; Sultan Amurat IV. with the most cruel kinds of death; Schah Abbas II. with penalties almost as severe; Michael Feodorovitch Tourieff ordered a bastonade for the first offence, cutting off the nose for the second, and the head for the third offence; Prussia and Denmark simply prohibited; and James, of England, wrote against it. Finding, however, that no penalties, however severe, could check the indulgence in a luxury so highly appreciated, sovereigns and their governments soon found it much more advantageous to turn it into a source of revenue; and the cultivation and manufacture of Tobacco was gradually subjected almost everywhere to fiscal regulations, restrictions, or monopolies, which still prevail under various forms over the greater part of Europe. In Tuscany its growth was prohibited, except in a few localities, where it was allowed under certain restrictions from 1645 till 1789, when the enlightened Grand Duke Peter Leopold declared free the cultivation of Tobacco over the whole territory. But the country did not long enjoy this privilege; the intrigues of private speculators prevailed on Ferdinand III. to restrict it to the same localities only which had previously possessed it. The number of them was further reduced in 1826, and the permission totally withdrawn in 1830, and Tobacco is now only grown here and there by stealth. Tobacco was in such general use in America when first discovered, and is there so

* Perhaps the vessels do not really branch into the young plant, but merely cause the tender tissue which rests on the vascular bundle of the matrix to undergo transformation. *M. J. B.*

widely spread, that it is difficult to come to any conclusion as to what precise part of that vast continent is its native country—probably some portion of the Mexican empire. As to the precise dates of its introduction into Europe, it has been already stated that it followed closely upon the discovery of America. The Spaniards under Columbus had scarcely landed in Cuba in 1492 when they began to smoke cigars; but they could only fully appreciate its luxuries when, in 1518, Fernando Cortez occupied the island of Tobago, where the plant was found growing in great abundance. Hernandez, the naturalist, was, it is believed, the first who brought it into Spain from Mexico, in 1539. It was introduced into Portugal from Florida by one Flamingo, and into France by Father André Thevet, or by some friend of his, although the more common opinion is that the first seeds received there were those sent about the year 1560 to Queen Catharine of Medicis by Jean Nicot, French ambassador in Portugal. It was probably raised also in England a few years later, but received no notice till its well known introduction by Sir Francis Drake, from Virginia, in 1586. In Tuscany it was first cultivated under Cosmo dei Medici, who died in 1574, having been originally raised by Bishop Alfonso Tornabuoni, from seeds received from his nephew, Monsignor Nicolò Tornabuoni, then ambassador at Paris, a great amateur of plants. After him it long bore the name of Erba Tornabuoni. A second, but smaller and coarser species, Nicotiana rustica, much grown in some parts of South-eastern Europe, is generally said to be a native of Europe and Asia, but this is a mistake; like the N. tabacum it is of American origin. So also is the long white-flowered Shirag Tobacco, recently published under the name of Nicotiana persica, but which is a mere variety of the N. longiflora, a species not uncommon in South America, and introduced from thence like the others since Columbus' discovery. *Journal of the Horticultural Society.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The Red Leschenaultias, although seldom used for the purpose, are capital subjects for flowering in the conservatory in winter, but they are very impatient of a damp confined atmosphere, and must be placed in a light airy part of the house, without exposing them to cold draughts. Care should also be used not to wet their foliage unnecessarily, and to keep them perfectly clear of green fly. Plants that are in vigorous health, and have been prevented from blooming since about June, and kept rather hard in autumn, will bloom profusely for months in a temperature of 50° or 55°. There is however considerable risk of injuring, if not losing them by this treatment, and valuable specimens had better not be placed here at present. Bulbs that are well rooted may be introduced to the forcing house pretty largely, for, as the season advances, there will be many things coming in which will render these less necessary; but there is no chance of their blooming strongly unless they are well-rooted before they are introduced to heat. And where hardy plants are forced for the decoration of the conservatory, these should be employed for early use as largely as circumstances will permit; for they are hardly admissible in any well-kept house, save in winter, when any gay-looking flowers are acceptable. All these things must be brought on very gradually, and a gentle bottom-heat would be useful towards securing a free root action. The busy season will soon be upon us, therefore, if any cleaning of plants remains to be done, this should be gone about at once; also see that the glass is perfectly clean, for plants require every ray of light which can possibly be afforded them at this season, and no greasy pots nor Lichen-covered balls should be allowed here, but everything should present a clean fresh appearance.

FORCING DEPARTMENT.

Pineries.—If circumstances should render it necessary to subject a portion of the "fruiters" to a brisk temperature, at once to induce them to start the most promising plants for fruiting should be very carefully selected, and placed in a small house or pit by themselves; and, where anything like a regular supply of ripe fruit is required, several houses, or separately heated compartments, should be at command; and without this convenience no gardener can reasonably be blamed for having too many ripe at one time, and none at others. It is not by any means desirable to start more plants into fruit at this early season than may be absolutely necessary, for they will produce finer fruit later in the season than can possibly be obtained from them now; and where a separate house cannot be commanded for those which must be subjected to a high temperature, we would advise that the plants selected for fruiting should be placed in the warmest part of the house at command, filling the rest of the house with young stock. The former should be afforded a bottom heat of about 85°, and the latter about 10° or 15° lower; the atmosphere should range from 68° to 75° by fire heat, allowing it to rise 5° with the assistance of sunshine, keeping the young plants near the glass, and properly supplied with water at the root. This temperature will be considerably too high for young stock at this season, but we have seen this system practised with considerable success; and although the young plants may get somewhat drawn, they will gain substance as light increases, and the evil will be less than running the risk of starting at this early period of the season the greater portion of the plants that are at command for keeping up the supply throughout the summer. Vineries.—Until the buds are fairly broken the points of the shoots should be kept nearly on a level with the lowest part of the Vine; and if this should not be found sufficient to induce the buds to start equally throughout the length of the Vine, the rod should be bent so as to bring the most forward buds to the lowest level, elevating those that are backward. Maintain a thoroughly moist atmosphere by frequently sprinkling the floor and passages, &c.; and syringe the vines lightly at least twice a day until the leaves begin to appear, when the amount of moisture must be moderated. Give every attention towards securing a gentle warmth for the roots; turning the litter, and adding fresh as may be requisite, and keeping it well protected from the effects of heavy rains and severe weather. Be satisfied with a moderate night temperature, until the buds begin to push, when it may be gradually raised to 60°, by the time that the leaves fairly begin to open. Peaches.—Until the trees are fairly on the move do not keep the night temperature higher than from 40° to 45° by means of fire-heat; but an advance of 10° early in the day, with plenty of moisture in the atmosphere, should be secured. Syringe the trees frequently, and secure a thoroughly moist atmosphere. Also see that the inside border is in a moist healthy state, and if this is not the case, two or three applications of tepid water should be given. It is becoming very much the order of the day to have Peach trees, and most other things which are wanted for very early forcing, in pots; and this plan offers the advantage of being able to afford the roots a mild regular bottom-heat, which is of the greatest importance in early forcing, and excellent crops are also obtained. But the trees must be prepared for this purpose by having been grown some time in pots; and where these are not on hand, unless they can be purchased from the nurserymen who prepare them, nothing can be done this season except to procure and pot the trees, and prepare them for next year.

FLOWER GARDEN AND SHRUBBERIES.

In situations where the tenderer varieties of Roses are found to require protection, this should be applied at once, as it may soon be too late. Also get in the stock of Briars for budding upon next year, if not already done, for it is generally desirable that these should make early and strong growth, and early planting is the best way of securing this. Some persons have an objection to planting shrubs or trees in the dead of winter, believing that the roots, if hurt at this season, are liable to rot, &c., and early autumn is certainly a very preferable season, but we would not delay such work unnecessarily a single day while the weather is favourable; and if the soil is properly prepared by draining, &c., where necessary, as should always be done before planting, there will be fewer failures from planting now than if the work is delayed until March. But where the ground to be planted is of a clayey nature, and in a wet unkind state at present, it will probably be better to dig the pits and defer planting until the soil thrown out has been frozen through, and then to select a rather dry time for putting in the plants. Soils of this nature should always, when it is practicable, be dug early in autumn, for neither draining nor anything but exposure to the atmosphere will bring them into a fit state for planting with a fair prospect of success. Roll walks and lawns after frost to keep them firm and smooth, and they will require the same attention frequently if the weather continues mild and wet. There will be comparatively little to be done in the flower garden, and any spare time will be well spent in going over the stock of plants in pits for next season's use, removing every decaying leaf, and cleaning the surface of the soil where this has got green or unhealthy, and replacing it by a covering of fresh sandy loam. There is nothing so inimical to these plants at this season as damp; therefore take every opportunity of admitting fresh air, and keep them hardy and stocky. Be prepared with plenty of covering to ward off severe frost, should such come upon us suddenly, as it did last year.

HARDY FRUIT AND KITCHEN GARDEN.

It is always desirable to get as much of the pruning and nailing done before the approach of spring as possible, therefore, while the weather is favourable for such operations, lose no opportunity of forwarding them. Besides the advantage of having so much work done, the garden will look much neater after the wall trees are nailed, and the borders made trim, and the small fruit bushes, &c. pruned, and the ground among them dug. See that standard trees which have been recently root-pruned, or moved, are firmly secured against wind, and also get any root-pruning or transplanting remaining to be done this season executed as soon as possible. Endeavour as far as circumstances will permit to have a good supply of Parsley under the protection of glass, for in the event of such a January as last, this will probably be rendered useless for an immediate supply, unless it can be afforded the protection of glass, and there is a large demand for this at all seasons in most families. Small Salads being wintered in cold pits should be freely exposed, except during heavy rains or frost. Look over the stores of roots occasionally, to see that they are keeping sound; also examine the Broccoli, and remove any heads that may be turning in and not wanted for immediate use where they can be protected from frost. See to maintaining a regular supply of small Salads, and any forced vegetables which may be in demand, and of which the convenience will allow of maintaining a regular supply, for it often happens with a casual supply that a thing is particularly wanted when it cannot be furnished.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Dec. 21, 1854, as observed at the Horticultural Gardens.

Dec.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth. 1 foot deep.	Of the Earth. 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 25th, 1827—therm. 58 deg.; and the lowest on the 28th, 1853—therm. 8 deg.

Notices to Correspondents.

American Blight: *B P.* Prune your tree hard in; then paint it all over down to as far below ground as you can get with the following mixture, viz., half a peck of quicklime, half a pound of flowers of sulphur, and a quarter of a pound of lampblack, mixed with boiling water till of the consistency of paint. First of all scrape off all loose bark, which *burn.*

Books: *T. Sparrow.* The *Gardeners' Chronicle* is of course "the best weekly publication on gardening in general." The best cure for the black thrips is dusting the parts affected with sulphur.‡

Diseases: *D J.* You are quite right in supposing that your Grapes are not affected with rust, and that the disease is not identical with that from Lord Harewood's garden to which you allude. As far as I can judge from the four berries you forwarded, of which three were crushed, it arises from some constitutional derangement, and not from any external parasite. The leaves are perfectly healthy. If it spreads, I should feel inclined to try very cautiously a weak solution of sulphate of iron, provided I were satisfied that the condition of the roots is good. The sulphur and lime will have no effect if I am correct in my supposition as to the nature of the disease; but I would not speak too positively, for, according to your own account, it is only incipient, and the specimens did not arrive in the best order possible. At any rate, the evil is more than skin deep, and you will probably find that the berries will enter upon a further stage of decay. *M. J. B.*

Greenhouse Climbers: *Anxious.* Clematis azurea grandiflora, Dolichos lignosus, Hardenbergia macrophylla and monophylla; Kennedya Marryattæ, Mandevilla suaveolens, and Tropæolum Triomphe de Gand will doubtless answer your purpose.‡

Ink for Zinc Labels: *J M D.* It is prepared as follows, viz.: verdigris, in powder, one drachm; sal ammoniac, ditto, one drachm; lampblack, half a drachm; and water, 10 drachms.‡

Kalmias: *H B.* No doubt they suffer from dryness. Give them a good mulching with *old* cow-dung; and if that is not enough pave the surface of the peat-earth with pebbles, as large as Walnuts or small Apples, to prevent excessive evaporation from the soil.

Lime Trees: *W E.* Instead of sowing Grass seeds, lay down some good turf under these trees; it will grow, provided the branches are not near the ground; and provided also the soil does not burn in summer.

Names of Fruits: *C L.* Your Pear is the Easter Beurré.‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J E H.* Billbergia amœna; 2, Miltonia spectabilis.—*J C.* Vallota purpurea.—*L M J.* The botanical name of the plant that yields the "St. Ignatius Bean," is Strychnos Ignatii, *alias* Ignatia amara.—*Vindex.* They are not in a state to be identified; but they probably are all varieties of Hippeastrum Johnsoni.

Roses: *Henry.* Move them in any dry not frosty weather, now rather than at a later period. Take the branch off the stone Pine now.—*Reader.* Guano, or fowls' dung, properly mixed with the soil, will be found a much better manure for Roses than night-soil. We would apply it in spring, just after they have begun to grow.‡

The Horticultural Society: *W E.* The admission fee is 2*l.* 2*s.*; the annual subscription, *not* payable in advance. 4*l.* 4*s.*; and the Society distributes gratuitously among its members such plants and seeds as it obtains from its collectors and correspondents, at home and abroad. It is, however, a rule, in making such distributions, not to allow them to interfere with the trade.*

The Cheiromoyer: *S A.* This is a tree, bearing a fruit of great excellence. It ought to be grown in a hot-house.

Thinning Plantations: *Inquirer.* No empirical rule *can* be given. The best practice, in general, is to leave between trees a space equal to half their height. But all such operations must after all be judged of on the spot. If your thinning, for example, has been neglected, then the space might be too great.

Transplanting: *H B.* If the Lime tree was moved early it will not be necessary to prune its top. Under no circumstances is it advisable to use the knife if it can be avoided. In the month of March look at the roots, and if they have made any attempts at growth all will be safe.

Vines: *G F.* You can do nothing till you bring the roots of your Vines up to the surface, which you may do safely if you remove them carefully. They will then be benefited by covering the border with sufficient stable manure to produce a little heat in it, and after they have become re-established and begun to grow freely you may give them a little weak manure water now and then with advantage.‡

Wild Flowers: *D E.* All flowers, except domesticated varieties, are wild somewhere. In their own countries they are called wild: in other countries they are called garden plants. Thus in England Snowdrop and Daffodil are as truly wild flowers as a Primrose or a Daisy; but in New Holland they would be exotics or garden plants.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PUBSEE, Sec.
Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

JOHN MORREN, GENERAL COMMISSION AGENT, Ock Street, Abingdon, is open for Commissions for the sale of Agricultural Implements, Manures, Seeds, &c., and for the purchase of Corn, &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM-ENGINES, AND COMBINED THRASHING, STRAW SHAKING, RIDDLING, AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as thrashed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. and Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading agricultural shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

HOSE PIPING.—GREAT REDUCTION IN PRICE.
PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 50 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster

SMITHFIELD CLUB.

TESTIMONIAL TO MR. B. T. BRANDRETH GIBBS, Honorary Secretary of the Club.

At a General Meeting of the Members of the Smithfield Club, held at the Show Yard, on Tuesday, Dec. 5, 1854, it was unanimously resolved:—"That a Subscription towards a Testimonial, to be presented to the Honorary Secretary, should be entered into, for his valuable and long-continued exertions on behalf of the Club, and in testimony of the highly satisfactory manner in which he has discharged the onerous duties in connexion therewith.

Chairman.
HIS GRACE THE DUKE OF RICHMOND, K.G.

Vice-Chairman and Treasurer.
CHARLES BARNETT, Esq., Stratton Park, Biggleswade.

Bankers.—Messrs. Hoare and Co., Fleet Street, London.

Committee.
T. Raymond Barker, Esq., Hambledon, Henley-on-Thames.
R. W. Baker, Esq., Cottesmore, Oakham.
John Clayden, Esq., Littlebury, Saffron Walden.
J. Tanner Davy, Esq., Rose Ash, South Molton.
Samuel Druce, Esq., Eynsham, Oxford.
Edward Frost, Esq., West Wratting, Linton, Cambridge.
Richard Garrett, Esq., Leiston, Saxmundham, Suffolk.
Thomas Greetham, Esq., Stainfield, Wragby, Lincoln.
W. Fisher Hobbs, Esq., Boxted Lodge, Colchester.
James Hole, Esq., Know House, Dunster, Somerset.
John Hudson, Esq., Castleacre, Swaffham.
R. Milward, Esq., Thurgarton Priory, Southwell, Notts.
Edward Pope, Esq., Great Toller, Maiden-Newton, Dorset.
Allen Ransome, Esq., Ipswich.
Professor Simonds, Royal Veterinary College.
Charles Stokes, Esq., Kingston, Kegworth.
William Torr, Esq., Aylesby Manor, Grimsby.
James S. Turner, Esq., Chinton Farm, Seaford, Sussex.
Jonas Webb, Esq., Babraham, Cambridge.
Lawrence Willmore, Esq., The Newarke, Leicester.
(With power to add to their number.)

In order to afford all persons interested in the success of the SMITHFIELD CLUB an opportunity of recording their names amongst the List of Subscribers, it has been determined by the Committee that the maximum amount of Subscription shall be limited to One Guinea.

Subscriptions may be paid to the Hon. Sec., or any Member of the Committee, or to the Bankers, Messrs. Hoare & Co., Fleet Street, London. WILLIAM FISHER HOBBS, *Hon. Sec.*
York Hotel, Bridge Street, Blackfriars, London.

THE LANDS IMPROVEMENT COMPANY INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

The Agricultural Gazette.

SATURDAY, DECEMBER 23, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, Dec. 28—Agricultural Imp. Society of Ireland.

WE are unfortunately precluded by the limits of our space from more than a reference, at present, to the meeting of the East of Berwickshire Farmers' Club, which we hope hereafter more fully to report. The subject principally discussed was REAPING BY MACHINERY, and many of our readers in the south will be surprised to learn the extent to which this is practised on many farms in the East and South of Scotland. Mr. HOPE, of Fenton Barns, cut nearly 80 acres this harvest with CROSSKILL'S machine, at about 5*s.* 6*d.* an acre. Mr. ANDERSON, of Black Dykes, cut 50 acres. Mr. HUNTER, of Thurston, cut 260 acres at the expense of 8*s.* 6*d.* an acre, "a charge being made for two pairs of horses a day." Mr. J. HOPE, of Elphingstone, cut 79 acres with the sickle, 85 acres with the scythe, and 35 with the reaper. Three scythes cut 18 acres in four days, at 9*s.* 9*d.* per acre. BELL'S reaper cut 15 acres in two days at 5*s.* 5*d.* per acre. This is evidence from East Lothian. As to that from Berwickshire, and the other particulars elicited at this meeting, we must postpone our remarks. Meanwhile our readers will see that while practical farmers generally amongst us look upon the reaping-machine as unlikely to come into general use, practical farmers in the Lothians are *using it and profiting by its use.*

IF asked to name the most remarkable truth which has been illustrated by the agricultural experience of the past year, we should point to the proved productiveness of Italian Rye-grass under the liquid method of manuring it. The extraordinary produce of green food thus obtainable, to which Mr. CAIRD most properly referred at the Tiptree gathering as the great agricultural feature of the day, has been abundantly canvassed, and is still so generally doubted, that the terms in which we have spoken of it have been condemned as wild and extravagant. Let us refer once more to the subject, in order to give the evidence which has appeared upon it since it was last named in these columns.

On the 7th of last month, at a meeting of the Royal Agricultural Improvement Society of Ireland, a paper on "High Farming in Scotland" was read by Mr. HAMILTON, containing a great deal of information, the result of personal inquiry, which threw considerable doubt on the statements made regarding the produce of Italian Rye-grass on Mr. TELFER'S farm and at Myre Mill, near Ayr. This paper, professing as it did to give the results of personal inquiry, appeared to us to contain evidence that ought to be laid before our readers, and they will accordingly find that most of it is given at page 763. Our object, of course, is to ascertain and print the truth, and, however strongly our wishes or opinions may have been expressed, no trustworthy evidence against them shall ever knowingly be withheld.

Mr. HAMILTON, in reference to Mr. TELFER'S farm, says that it contains 11 Scotch acres under Italian Rye-grass; and that the 50 head of cattle on it (48 cows and 2 horses) receive 4 stones of Grass and 30 lbs. of Cabbage apiece each day during summer, along with 6 lbs. of compound (hay and oil-cake steamed together). In winter grated Mangolds are substituted for the Grass. The summer hay is supposed to be made from the Rye-grass, and it, with the 4 stones apiece of "soil," is made equivalent to 5½ stones of Grass daily to each cow = 275 stones, or upwards of 34 cwt. daily; which, again, is made equal to 33 tons per acre over the 11 acres; Mr. HAMILTON imagining, we suppose, that the supply was maintained after this rate during seven months of the year. And a very extraordinary result this is—so wonderful, that taken by itself and apart from the character of the evidence, we do not hesitate to say that incredulity in reference to it is quite as natural and justifiable as in reference to the still more extraordinary statement given on Mr. TELFER'S authority at Tiptree. This astonishing produce, certified by so cautious and even reluctant a witness will, then, doubtless be believed; perhaps the more so that Mr. HAMILTON, not content with the hesitation with which he commits himself to it, takes the opportunity of denouncing the recklessness of others—the carelessness of Mr. CAIRD, and the mischievous assertions which he made at Tiptree on this subject! And there, excepting the publication of a correspondence between these gentlemen, the matter might have rested; and those who found it difficult enough to credit Mr. HAMILTON'S assertions would have left those of Mr. CAIRD in scornful unbelief.

Fortunately, however, a letter from Mr. TELFER appears, and from it we learn to whom the charge of carelessness properly attaches. We learn from it, as to matters of detail, that in Mr. HAMILTON'S statement "one hydrant to every 2½ acres" of Mr. TELFER'S land is put for "1 to every 6 acres;" the "application of solid dung from the cattle mixed with the liquid" is put for "liquid alone;" the "autumn feeding of the cattle" is put for "what they have during summer;" and, as to the main matter under consideration, "*eleven acres of Italian Rye-grass*" are put for "*three and a half!*" The question now arises what degree of dependence is to be placed on this gentleman's account of the other farms he visited, with the view of ascertaining the merits of the practice of liquid manuring. His aim was no doubt praiseworthy, and no one doubts his honesty; but his evidence is valueless, simply from that carelessness which he has charged on Mr. CAIRD. Personal reference in this way to the subject is allowable when a matter of such first-class agricultural importance hinges on the trustworthiness of witnesses, and it is especially allowable when used, as we have used it, in personal defence.

One word more, however, apart from the character of witnesses:—Mr. TELFER'S letter does not say that the cattle were fed from 3½ acres only. He manured and cut from 3½ acres up till July, and

then when the Rye-grass on other 3½ acres sown this spring was ready, he manured *it*, and let the former 3½ acres go to seed. Seven acres were thus concerned in the produce of this food—but 3½ acres was the maximum extent *manured;* and he would have done as well to go on with what he had begun as to turn the manure on to the young Grass. Among the food given to the cattle was 270 tons of Rye-grass, cut *in this way* from 3½ acres. Most people will imagine that from July on till October, 3½ acres of one-year-old Grass would be more productive than the same extent of Rye-grass sown the same spring; and this is borne out by the fact that from a portion of the original field which Mr. Telfer continued manuring, he obtained 82½ tons per acre.

We believe the experience thus related entirely corroborates what we have already published on the subject, in reference to Mr. Telfer's farm; and that, however difficult gentlemen may find it to believe—it is the fact that there is a method of manuring by which these prodigious growths of green food are obtainable; there is a crop which, under treatment of this kind, will maintain the extraordinary head of stock to which, on Mr. Telfer's and Mr. Kennedy's farms, reference has been made.

If it be a fact that the land of England and Wales, to say nothing of Scotland and Ireland, is at this moment prepared to absorb at least 100,000,000*l.* of capital in permanent and profitable improvements, such as drainage and kindred operations on the soil, and in the improvement of buildings and fences, and the extended application of machinery to the business of the farmer—and no one at all acquainted with the state of the country, and knowing that it possesses an area of 37,324,915 acres will doubt that such an estimate is considerably under the mark;—and if it is likewise a fact that the country abounds with capital, which, but for the legal and other difficulties in the way, would at once find its legitimate occupation in supplying the improvements here partially enumerated, instead of applying itself to Spanish and Pennsylvanian bonds and other forlorn hopes in its search after employment, then it follows that any association which finds out and applies a practical remedy for this state of things, which discovers a means of bridging over the gulf between land on the one hand and capital on the other, so as to permit of their being united in an easy and effectual manner, confers not only a benefit on the land which wants the capital, and on the capital which wants employment, but on the country at large, whose resources are cramped, and whose supplies are stinted for lack of this mutual accommodation.

We lately drew attention to the "Lands Improvement Company;" and the services which we have above described are precisely those which that company undertakes to render. The idea, if we may so speak, upon which it is founded is that no reasonable or supposable amount of paid-up or nascent capital of an ordinary company would be equal to the magnitude of the operations which it has in view; and, therefore, instead of coming forward and announcing itself as a company with a certain amount of paid-up capital, which it is willing to lend out on the land under certain conditions, on the faith of certain acts of Parliament which it has obtained, it sets itself forth merely as an agent—an agent, on the one hand for the land, *i.e.* the borrower; on the other for capital, *i.e.* the lender. In fact it is the bridge by which any amount of capital which can be profitably invested, may be safely and easily carried over and laid out in the improvement of our fields and homesteads. It does not undertake to lend, and does not lend its own capital, except to a very limited extent under certain circumstances, and even that proportion, small as it is, it is now about to ask Parliament to permit it to decline in future; so that it may confine itself wholly to negociating and facilitating loans, contenting itself with a moderate per centage on the transactions, as a remuneration for its trouble and risk of alterations in the money market, and the use of its powers.

In this respect we believe this company is unique among land improvement companies; and we feel satisfied that the plan merits, and will receive the support of our readers. Let us now examine the means by which it is carried out.

The act which regulates the company is an act of 16 and 17 Vict., which received the Royal assent 4th August, 1853, having now therefore been in operation rather more than a year. It is entitled "An act for incorporating the Lands Improvement Company, and to afford facilities for the improvement of land by enabling the company to issue transferable mortgage debentures."

"Absolute owners of land are within the scope of the act; its value, however, mainly consists in enabling substantial improvements to be effected by, or on behalf of, parties possessing merely limited or special interests in the land, such as tenants for life, trustees, incumbents of livings, bodies corporate, tenants by the curtesy, married women, and generally all persons (except tenants at rack rent, &c., in actual possession of the land, or in receipt of the rents. In Scotland, the provisions of the act extend to every liar, life renter, heir of entail, husband of a married women seised in her own right, tutor, curator, and other guardian for any infant, minor lunatic, or idiot, fatuous or furious person, and every trustee, when in the actual possession of the land, or in receipt of the rents.

"Every such person is empowered by the act to charge the inheritance by way of terminable annuity (for from 14 to 25 years at will), with the outlay on any one or more of the following improvements, authorised by the enclosure commissioners:

"1. The drainage of any lands by any such means as the enclosure commissioners shall approve.
"2. Irrigation and warping of land.
"3. Embanking of land from the sea, or tidal waters, or rivers, in a permanent manner.
"4. Enclosing any land, or improving the drains, streams, or watercourses of the land.
"5. Reclamation of land lying waste.
"6. Making farm roads, to the extent of one-half of the outlay for such roads.
"7. Clearing lands.
"8. Erection of farm houses, and other buildings required for farm purposes, to the extent of three-fourths of the outlay for such farm houses and other buildings.
"9. Planting for shelter, to the extent of one-half of the outlay for such planting.

"Together with all such works, engines, machinery, engine-houses, mills, kilns, sheds, yards, shafts, tanks and reservoirs, pipes, conduits, and water-courses for irrigation, tram-roads and other ways, bridges, weirs, sluices, flood-gates, and hatches, as may be necessary for carrying into effect any such improvements."

The above is quoted from the prospectus of the company. We add to it that we understand that it is about to ask Parliament for powers to charge the whole cost of some of those improvements, of which at present, as it will be seen, it can only charge certain proportions.

The company finds the money required for the improvements and all charges connected therewith, taking in lieu thereof a rent-charge, or terminable annuity upon the security of the land, which may be made to extend over any period from 14 to 25 years, at a rate of annual payment varying with the number of years over which it is spread, and the market value of money at the time the loan is contracted. At present the rate for a rent-charge ceasing at the end of 25 years is 6¾ per cent.

Where the company negotiates the loan, the charge for trouble, risk of increase in the market rate of money during the subsistence of the rent-charge, and use of the act is 5 per cent. The law charges for sums under 10,000*l.* are ¼ per cent.; for sums above that amount, ⅛ per cent.; and the fixed charge for paper, postages, &c., is from 2*l.* 10*s.* to 7*l.* 10*s.* on the whole loan, according to the extent of the loan and the correspondence required.

Where the lands are entailed, the works must be executed to the satisfaction and under the sanction of the Enclosure Commissioners, who are the legally constituted guardians of the reversionary interests in such cases. Where parties wish to expend their own money; but at the same time to preserve a rent-charge on their estates for the money so expended, they are allowed to use the powers of the company, on paying from 2½ to 3 per cent. on the amount so charged by way of terminable annuity, as a remuneration for the trouble of the Company in arranging with agents and the Enclosure Commissioners, and for the use of the act. By this means parties being tenants for life in possession of settled estates may apply their own money to the improvement of the property, and still possess the power of disposing by will of such portions of it as may not have been repaid. This provision, it will at once be seen, is of the greatest possible value to men in the enjoyment of strictly settled estates, with families to provide for, and capital of their own to employ.

We have already adverted to the fact that this company does not interfere in the execution of the works, but leaves the proprietor to deal with his own agents, architects, or surveyors, in reference to the carrying out of the improvements. The only restriction is that in the case of *settled* estates, the Enclosure Commissioners must be satisfied that the proposed works are judicious and likely to be profitable; and that they are properly carried out.

The great and novel feature in this company is its debenture system. It is empowered to borrow money at all times on debentures founded on the rent charges and certified under the hands and seals of the Enclosure Commissioners, in exchange for the money which it may lend on land. These debentures form a first charge on the estates for which they are issued, and inasmuch as they are based upon the best of securities, and are not fluctuating in their value, they will no doubt, when they are better known and understood, come into great favour as a class of securities, the result of which will be that money will be obtained at a very moderate rate of interest upon them.

We have on former occasions noticed approvingly the proceedings of other companies having similar objects in view; and, in now particularly mentioning the "Lands Improvement Company," we have no wish to be supposed to disparage the others in any degree. We believe that in the great field of this country there is room for them all and to spare; but we have felt that we are called upon to keep the agricultural world *au courant* of matters so deeply interesting to it, and to bring under notice the plans and operations of a company with the proceedings of which we have taken pains to make ourselves acquainted, and which we feel merits our hearty meed of praise for having taken a step in the right direction, by bringing into play a principle so new, and yet so valuable, as that we have now endeavoured to explain.

We have been informed that the company has already contracted loans to the extent of no less than 200,000*l.*; and so thoroughly satisfied are those who have made this subject their study of the soundness of the principles involved that, we understand, one at least of the existing companies is about to make application to Parliament to permit it to do business in the same way. In all this we see great advantages to the cause of agricultural progress; and we hail with satisfaction any extension of the facilities for the application of capital to land.

PEDIGREES OF SHORT-HORNS.

"Have any of our readers ever undertaken the investigation of pedigrees?" Such is the question at the head of one of the articles in the *Agricultural Gazette* of Dec. 9. There are few short-horned breeders who have not studied the "Herd Book" more or less; but though that source of information on the important subject of pedigrees is as perfect as it well can be expected to be, it will afford to the general investigator very little assistance as a practical breeder, and he must apply to other sources for the information he wants, and which is essential to his success. The fact is that certain tribes of short-horns, or families, have established characters as good breeders, which has raised them in public estimation and made them valuable, and though in an old established family a strong cross may sometimes answer, yet the case in which it does is the exception, and no short-horned breeder would attempt it if he could possibly avoid the risk. Now with regard to the instance which you produce of Mr. Bates's Cleveland Lad, it would be a dangerous precedent for two reasons, 1st, the Matchem cow was not "almost without a pedigree;" she was bred by Mr. Brown. Now Mr. Brown, though he kept no written pedigrees, was a breeder of short-horns, for, I believe, half a century; he bred from Mr. Mason's best bulls, of which Matchem was one; this was well known to Mr. Bates, and when the cow produced a first-rate bull, Mr. Bates used him with confidence, well knowing the purity of the blood. It is well known to those persons who were acquainted with Mr. Bates that he did not speak very favourably of other short-horned herds, and that he very frequently disparaged the Mason blood. He therefore did not search after the pedigree of the Matchem cow, because he knew well it would lead him up to Mason; he preferred leaving the pedigree in the state we have it in the "Herd Book;" however there is more than one short-horned breeder now alive, who has heard Mr. Bates describe the Matchem cow and say she had no inconsiderable dash of Mason blood. Mr. Mason's sale of short-horns was in 1829. Two Irish gentlemen attended them and were purchasers, and after the sale was over, this Mr. Brown, the breeder of the Matchem cow, came up to them, seeing they wanted short-horns, and told them then he had a very good well bred herd; that they were always crossed by Mr. Mason's best bulls; and that if they went home with him he would sell them as good as any sold at Mr. Mason's sale, and for half the money paid there. They did go to Mr. Brown's, and did purchase from him, and there can be no doubt his herd was purely bred for many generations. "Matchem's dam was by Farmer, and Farmer was out of a cow entirely unknown." Now this would lead many to believe that Farmer was not well bred, and I rather think the supposition would be incorrect, for the dam of Farmer was bred by Mr. John Newby, a man who bred good short-horns, of pure blood, though he did not keep his herd book. The fact is at that early day there were few of the short-horned breeders who kept the pedigrees of their herds, if we except Mr. Charles and Mr. Robert Colling and Mr. Mason. Let any one look into the "Herd Book" now and read the pedigrees of some of Mr. Booth's herd, and yet is there a breeder in the United Kingdom who has any doubt of the purity of the blood, and of the pedigree being as good as the Duchess, or any other of the celebrated families of short-horns contained in the "Herd Book;" but from not having kept herd books at that early time, the pedigrees are apparently short, though in reality as long or longer than the others. Secondly, the Cleveland Lad cross is assumed by the writer in the *Gazette* to have been an improvement on Mr. Bates's herd; however this may or may not prove to be the case, it must be admitted that with English breeders the fact is disputed. The writer of these few observations was fortunate enough to meet a large number of the best short-horned breeders in England, immediately after Mr. Bates's sale; they were not breeders of yesterday, with characters to establish; they had most of them established their characters, and there was not a second opinion among this assemblage, that the cross of the Cleveland Lad had considerably deteriorated the Bates herd. Well, the Tortworth sale came on in no very long period after, and appeared to have stamped the character of the Bates blood with the

seal of public approbation, but though the writer had on that occasion every opportunity of hearing the opinions of disinterested individuals on that remarkable sale, he never heard an opinion as to the cause of the extraordinary prices that did not attribute it to the Duchess blood altogether; in fact, the Cleveland Lad cross was never thought of, and I am persuaded is never thought of as being in any degree the cause of the great sums paid for Lord Ducie's herd on that occasion. Therefore I would warn the public not to get too fond of crosses, and not to imagine that it is an undoubted fact that this well-selected cross of Cleveland Lad has wonderfully improved the Bates blood. The truth is, crossing injudiciously has been the ruin of half the herds in England, and no rule that can safely be depended on has yet been laid down to guide the breeder in this respect. There are families of short-horns whose male animals have been, generally speaking, valuable crossings; I may mention Mr. C. and Mr. R. Colling, Mr. Mason, and the late Earl Spencer; I omit the names of living breeders, as I do not like to raise any difference of opinion on the subject. I think the value of the male animals of these herds I have named is undisputed. Now, it will be observed, they were themselves particularly free from crosses, and to this cause—one common to all of them—I am disposed to attribute their great value for crossing; it is well known the most powerful influence of the male animal appears to act where there has been a good pedigree, and that males of imperfect or doubtful pedigrees have never (no matter what their external form may have been) been safe stock getters; this is so universally admitted that it is unnecessary to dilate on it, and we shall find that all the first-rate bulls that are celebrated in short-horned history were all closely bred, had few if any crosses, and propagated their own perfections to their offspring with certainty. My object in these few remarks is to caution the inexperienced breeder against adopting the crossing system; it will be found to be attended with great danger, seldom successful, and the injury thereby inflicted irreparable. Some first-rate families of short-horns have been at once ruined by *one* injudicious cross, and it is now time to guard against the evil; in-and-in breeding to a great and unwise extent was first the practice, then the crossing system followed—the breeder was directed to go any distance for a cross, and paid dearly for his journey. Now the middle course is recommended; but as yet no safe rule or guide exists to direct the unlearned, and experience alone has any chance of success. *A Member of the Royal Agricultural Improvement Society of Ireland.*

LOIS-WEEDON:

A LECTURE ON THE REV. MR. SMITH'S SYSTEM OF GROWING WHEAT.

DELIVERED AT OXFORD BY DR. DAUBENY, SIBTHORPIAN PROFESSOR OF RURAL ECONOMY.

In the lectures that I have hitherto given, the general tenour of my remarks, would lead my hearers to infer, that it must be necessary for the farmer to be continually replacing the loss which his land is sustaining by the crops drawn from it in the course of cultivation. The application of manures—which forms the subject of one principal part of agricultural chemistry—seems built upon this supposition, and when instances are given of land not requiring manure, they are treated as exceptional, and pointed out as extraordinary cases of exuberant fertility.

Nevertheless a little reflection will convince us, that if this be indeed in the existing state of society the most usual condition, it is not that which would present itself in an earlier and a less artificial one, and that perhaps the more normal arrangement would be that in which the land yielded to the crop a sufficiency of inorganic as well as organic materials for its growth, without requiring any assistance from without.

For let us consider the state of a purely agricultural community, without much commerce or manufactures. In such a case all that was produced by the soil would, under common circumstances, be consumed upon it, and consequently the greater part of what had been extracted would, in the course of a certain cycle of years, be returned to it again.

The cereals, for example, would become the food of man and beast; and thus, after the lapse of a certain term, only so much nutritious matter would be really lost to the land as was equivalent to the increase of population during that period.

But it must be recollected, that by the system of fallows in use amongst all nations in an early state of civilisation, time is allowed for the subsoil to undergo that action from the elements which is necessary in order to enable it to render the phosphates, the alkalies, and the other materials of nutrition locked up in it, soluble in water, and thus available for a future crop.

No fear, therefore, need be entertained under such a state of things, that a soil possesing originally the ordinary amount of fertilising principles should become poorer in the course of cultivation, even although no artificial manure be added to it.

In a community, however, like our own, the circumstances are much changed. The existence of populous cities, non-producing so far as animal subsistence is concerned, occasions a continual drain upon the agricultural districts, which must frequently exhaust the nutritious principles soluble in the soil, quicker than they can be supplied in the ordinary way by the decomposition of those portions that are exposed to the air. Thus, for instance, the pastures set apart for dairy farms in Cheshire supply the cows which browze upon them with the phosphates contained in their milk, and the latter converted into cheese is carried off to the large cities, where it is consumed.

Hence has arisen, in the course of time, a scanty produce arising out of the deficiency of phosphoric acid, and for this, as was strikingly proved in Cheshire, the application of bone-earth, which abounds in phosphates, was the most appropriate remedy.

A similar explanation may probably be given of the advantage derived from guano and other artificial manures, although it seems probable that if the sewage of great cities could only be collected and returned to the agricultural districts from which their constituents originally proceeded, there would be no need of any of those artificial substitutes which have lately been so much in vogue.

I have now, however, to detail two instances, one that occurred at the beginning of the last century, the other going on at the present time, in which a constant succession of abundant Wheat crops has been produced upon the same land without the application of any manure whatsoever. The former of these was afforded us by Jethro Tull, whose main principle it was to pulverise the soil effectually to the bottom of all that could be made available for the purposes of agriculture, in order that every particle of the mould might be brought into contact with the atmosphere, and the roots of the plant might be enabled easily to permeate the loosened earth, and so take up the food placed within their reach. The plan, it appears, suggested itself to him during his travels on the continent, from observing the mode in which the Vine was cultivated. He found that in this instance the principal stress was laid upon pulverising the soil between the rows, no manure, indeed, in his time appearing to have been used at all, under the impression that the taste of the grape would be affected by its use. I believe that at present the best Vine growers condemn this practice of manuring as injurious to the quality of the wine; but it is no less true, that those who are more solicitous about quantity than quality, are wont to manure their vineyards highly.

I do not think therefore that the argument as applied to other crops is a very sound one, especially as the objection is only to animal manures, it being the received practice to enrich the vineyards by cultivating in them once in three years Beans, Buckwheat, Lupines, and other plants, which are dug in at the roots of the Vines when they have come up, and which constitute a kind of vegetable manure. The practice is as old as Columella. (See the article "Vigne," in the "Nouveau Cours d'Agriculture;" Paris, 1838.)

In other places a compost is made with the soil of the vineyard and leaves of trees, grass, dried herbs, &c.; and these are placed at the roots of the Vines. Thus Jethro Tull would seem to have been led to a right result by an erroneous principle.

With a view, then, of affording a free passage to the fibres of the roots of his crop, Tull divided his field by broad and deep furrows into sections, each of 6 feet in width. In the centre of each section he drilled his seed in two rows, about 10 inches apart, so that there was an interval between them and the next double row of about 5 feet. He then before winter, after closing up the furrow, ploughed up the whole space intervening between the rows of corn, with the exception of the 6 or 8 inches of ground nearest to the latter, so that in fact his plough must have been within 3 or 4 inches of the crop—a nice and delicate operation, as the slightest deviation of the plough from its straight course would tend to cut through the roots of the corn.

In the spring the soil thus fertilised by exposure was thrown up against the growing crop, by restoring the furrow in the centre of the intervening spaces, and using the soil dug out for the purpose.

But the operation to which he attached the greatest importance was that of horse-hoeing, which was practised again and again in the course of the summer throughout the intervening spaces, only taking care to recede farther and farther from the growing crop as the roots spread themselves outwards. In the culture of the Turnip the same principles were pursued. The ridges were of the same width as for Wheat, but only one row was drilled in each ridge, and the seeds were deposited at different depths, half about 4 inches deep, and the rest 4 inches deeper, so that in wet weather the shallower, in dry the lower ones, made their appearance first.

He was no advocate for a rotation of crops, but maintained that by this thorough pulverisation of the soil, cereals and others might be grown year after year in the same soil, and all manure be dispensed with.

The perusal of Tull's work is somewhat repulsive from its controversial character, and its frequent allusion to persons and to practices now forgotten, nor are his theoretical views such as are calculated to command attention at the present day. He however has the merit of first demonstrating, how much may be done by these simple mechanical means, which, as we now know, liberate the latent resources of the soil, and attract from the atmosphere the ammonical salts which are so essential to vegetation. That he obtained better crops than the farmers around him, and that his method was particularly successful as applied to root crops, is generally admitted; but in spite of this, the system after his death came to be discontinued, and gradually died away altogether. For this Mr. Smith, of Lois Weedon, who has lately revived the same system of culture, endeavours, in the pamphlet to which I shall have frequent occasion to refer in this Lecture, to account, by alleging that the difficulty of putting into practice Tull's principal rules had deterred farmers in general from following in his footsteps.

First, he remarks, it was necessary at the first ploughing before winter to guide the plough with such unerring nicety, that a slice should be cut from the sides of the Wheat 3 or 4 inches only from the tender plant, and again in early spring when the plant was weak, to throw back the slice against the rows. Both these operations required the greatest exactness; the first lest the plant should be cut through or injured, the second lest the Wheat should be too much buried in the soil. Few labourers could be depended upon to perform so delicate an operation.

Mr. Smith also justly remarks, that there is a vagueness in Jethro Tull's statements, which robs them of the authority otherwise to be attached to them; and it must, I think, be admitted that although he stumbled upon an improved method of practice, he damaged its success by attributing it to wrong principles, and by combating other methods of long standing and approved utility, which were in vogue amongst his neighbours and in the country generally.

He contends, for example, that manure is of no use whatever, except it be to pulverise or divide the soil, and that earth is the only food which plants require for their growth. The former proposition few will be disposed in the present day to accede to; the latter contains a basis of truth, if by the earth we suppose him to mean all that the soil contains or can collect from the atmosphere, but in the vague manner in which the statement is put forth, it would be rather calculated to mislead than to direct us in the right path. Tull, moreover, never gives us his balance-sheet, or even the amount of his crop, although it may be inferred from trials made and reported upon by some of his best disciples—Chateauvieux and Duhamel for instance—that the corn crops produced on his plan would not, on the average, exceed 16 bushels an acre, an amount which in those times might perhaps be regarded as considerable, but which we have since learnt means of greatly surpassing.

Whilst, therefore, the success which attended his efforts may suffice to persuade us of the benefits resulting from a more thorough pulverisation of the soil than can be obtained by ordinary ploughing, we are naturally led to inquire whether his principles may not be carried out in a more effectual manner by the aid of modern skill and experience.

Now the other system, which in many of its leading characteristics resembles that of Tull, is carried on in this very part of the country, within a morning's drive from Oxford, by the Rev. S. Smith, the intelligent clergyman of Lois Weedon in Northamptonshire, who, in a little unpretending pamphlet, entitled, "A word in Season; or how to Grow Wheat with Profit, addressed to the stout British Farmer," which has gone through 13 editions, gives us the following account of his method of proceeding.

He begins by dividing his corn field into sections of 5 feet in width. In the centre of each section he drops or drills the seed in triple rows 3 feet apart, so that between each triple row there is an interval of 3 feet left fallow when the plant is up. He trenches the spaces between the cultivated portion with the fork, taking up the soil to within 3 inches of the Wheat crop. These spaces are kept clean at spring and during summer with the blades of the sharp-cutting horse-hoe, and are kept open with the tines of the scuffler. Thus each year 2½ feet of each section of the field are trenched and prepared for the succeeding crop, whilst the other 2½ feet are left for the crop at the time growing, so that one half of the land is yielding Wheat, and the other half left fallow in preparation for the succeeding year.

By this treatment Mr. Smith assures us that the average yield of half an acre for the last nine years, ending with the present, has been no less than 34 bushels; so that he can calculate upon this return every year from each acre of land set apart for the growth of corn. The crop of this year not having been threshed out cannot be exactly ascertained; but certainly when I visited the spot in July last, even the most unpractised eye must have been struck by the extraordinary height, evenness, and fulness of ear which the field exhibited; nor can there be any reasonable doubt that the produce in this particular instance does, on an average, greatly exceed that of the neighbouring lands cultivated in the ordinary method.

But two questions will naturally occur, to which it is perhaps not easy to return so decisive an answer. The first relates to the quality of the land. Would the treatment which is found so successful on the field in Mr. Smith's occupation succeed equally well on land of average fertility?

To this it may be replied, that the subsoil in the above instance is of two different descriptions. One portion is a clay—the other a gravelly loam. The former is rich enough to require no addition; the latter, which is in some parts hungry, was dressed with the clay taken off the other portion, and with this addition can itself dispense with manure.

Now, Mr. Smith has very justly remarked, in the preface to his 12th edition, "that if we set aside the cases of pure clay and porcelain clay, the great majority of argillaceous soils contain every mineral element of fertility for the Wheat plant in abundance—that abundance varying according to the quality of the clay itself; for when the analytical chemist speaks of mere traces of such and such an ingredient being found in a given soil, he is speaking of what he finds in the few ounces of each under examination.

"But bring up even a superficial inch of subsoil from an acre of land, and these few ounces are increased to a hundred tons, when the slight *traces* will become deep *foot-marks*.

"Increase by degrees the quantity to 10, 12, 18 inches, and there will be no fear then for that promised and lasting abundance. But clay, in its natural state and position—that is, as it lies unmoved and cohesive below the surface—does not yield up its hidden treasures, which remain almost wholly insoluble, and all but inaccessible to the roots of the plant."

Dr. Völcker, of the Agricultural College at Cirencester, has shown, that clay otherwise inert, and consequently barren, may have its resources rapidly developed by a temporary exposure to a high temperature. He found that if a specimen of clay were exposed to a dull red heat for only about half an hour in a closed crucible, the proportion of soluble inorganic substances extractible from it was increased from 6.7 to 10.5 per cent.; but that if the heat were increased and prolonged beyond that time, the amount diminished so as to become less than it had been previously. He also found that by this treatment the quantity of potass that could be extracted was sensibly increased.

"Bring up then," says Mr. Smith, "the clay to the surface. Apply to it the action of fire at the due temperature, and its condition will be wholly changed. Its texture is altered, and it has become porous. It absorbs the organic substances of the atmosphere. Its dormant inorganic substances are awakened, and become gradually soluble. And if the heat should have dissipated in some degree the ammonia, and rendered less soluble the phosphates, it has been proved abundantly that clay properly burnt is still, chemically as well as mechanically, of very great agricultural value."

Improperly burnt, however, that is, burnt beyond that due and proper temperature, the baked clay loses its high value. The solubility of its mineral ingredients is quickly diminished. The ammonia has vanished altogether. It is less absorbent of that principle from the atmosphere, and the labour and expense of the process in a great measure are thrown away.

Now, Mr. Smith contends that by the practice I have been describing of simply bringing up the clay, and exposing its surface to the action of the atmosphere, all the good effects of burning are secured, and all the evil avoided.

"The clay becomes pulverised and porous, and in a condition to absorb and retain the atmospheric ammonia. Whatever ammonia already exists in the clay remains, and a sufficiency of every inorganic element of fertility is rendered soluble and available to the wants of the growing plant. Such has been my process on land not naturally suited for Wheat, and there can be no doubt, I conceive, that the good effects of this single inexpensive dressing of clay will survive for several years. Comparatively inexpensive, for one spit deep will now suffice for the digging of the intervals, since the mineral substances being already on the surface, no double digging need search for them from below."

"On the original piece of land," Mr. Smith adds, "which is strictly Wheat land, there is now coming up very vigorously the 10th crop of Wheat, the crop for 1854 having been even heavier in appearance than that on the gravelly loam. The subsoil here is tenacious yellow clay of good quality, so tenacious, indeed, that in forming my water-tight liquid-holding tanks I have but to dig and the feat is done. When, therefore, I have reminded the reader that heavy loams and clay subsoils, those very soils which are the hardest and most expensive to work in the ordinary way, are the soils expressly suited for the scheme I propose, I have nothing further to add under this head. For it will be self-evident, that what in the case of the lighter soil had to be conveyed to the intervals, is at hand here and under the spadesman's feet, and that when this clay is brought to the surface before winter, it has a 10 months' fallow at least, while a full crop of Wheat is growing at its side. It is a common fallow in short, without the common accompaniment of a fallow—the loss of a crop."

With regard to the second question, namely the economy of Mr. Smith's method of culture, or the balance between the receipts and the expenditure, the report given by the author is very satisfactory. Notwithstanding the greater expense of spade husbandry than of the plough, the profit per acre is stated to be no less than 7*l.* 0*s.* 6*d.*, the Wheat being estimated at 40*s.* the quarter, and the straw at 2*l.* per ton. The following are the items by which this favourable result is made out.

Expenditure.	£	s.	d.
One double digging	1	10	0
Two single diggings, with fork	1	0	0
Pressing, sowing, hoeing, carrying, thrashing, rates and taxes	2	1	0
2 pecks of Seed (5*s.* per bushel)	0	2	6
Total	£4	13	6
Income.	£	s.	d.
4 qrs. and 2 bush. of Wheat (at 40*s.* per qr.) ...	8	10	0
1 ton and 12 cwt. of straw (at 2*l.* per ton) ...	3	4	0
Total amount of produce ...	£11	14	0
Deduct outlay	4	13	6
Total amount of profit	£7	0	6

From this, however, must be deducted the rent which a tenant would have to pay for such land; but, supposing this to be as high even as 2*l.* per acre, the profit to the tenant would, according to this calculation, be no less than 5*l.*

There is also a further recommendation of this practice in the employment it affords to the agricultural labourer, for nothing can be a better state of things than that an increase in the labour bestowed upon the soil should, amongst an overflowing population, give rise to an increase of produce, equivalent, at least, in value to the greater expenditure lavished in obtaining it.

"I look," says Mr. Smith, "upon this as one of the greatest advantages of the scheme I advocate; that if it were carried out, it would enable the farmer willingly to find constant and most productive employment for those for whom at present, whether occupied or not, he is forced to find bread."

Now the great secret of Mr. Smith's success appears to be the care he takes in stirring up the subsoil and exposing it as completely as possible to the action of the air and water.

"The diggings," he says, "at first are to be as much as two spits deep, but the depth is to be measured year after year until they reach the depth of 20 or 24 inches. The first spit is turned over the superficial soil, and upon this the second spit is thrown, so as to be uppermost of all, thus allowing the frost to penetrate through the entire mass. In this manner the soil is thrown up in ridges, which rising higher than the winter crop, tend to shelter and protect it. It is then stirred again with the fork in the spring, and is again treated, after the crop is carried, with the fork and pulveriser, after which it is levelled for seed time." In this respect there is a great contrast between his practice and the original one of Jethro Tull, who would dissuade us from ever ploughing below what he calls the staple of the land, or, in other words, bringing up the sub-soil.

Now let us consider how far land treated in this way can be expected to supply for a number of successive years that amount of the organic and inorganic principles, which is required for the growth of a Wheat crop averaging 34 bushels to the acre. The organic matters present in the crop are composed of oxygen, hydrogen, carbon, and nitrogen. The three former are presented to every plant in sufficient abundance for any conceivable amount of produce, in the form of water and carbonic acid. The nitrogen therefore presents the only difficulty. It has been generally assumed that this element, although present in such large quantities in the atmosphere, can only be obtained by plants from the ammonia brought into contact with its absorbent surfaces.*

Let us, then, inquire whether upon this supposition the soil would be likely to furnish the nitrogen which is present in a crop of Wheat of the quantity supposed. If we take up this question upon theoretical grounds, I fear we shall hardly find sufficient data upon which to proceed. Liebig's authority has been quoted in proof that every pint of rain water contains one quarter of a grain of ammonia, according to which estimate it would follow that, as the average amount of rain which falls upon an acre of ground is not less than 5,096,520 lbs., no less than 166 lbs. of ammonia would be brought into contact with that breadth of soil in the course of a single year. But I do not find that this is anywhere absolutely affirmed to be the quantity present by the above-mentioned chemist, or that it is put forward by him excepting hypothetically; whilst undoubtedly the most recent experiments of Boussingault seem to show, that the largest quantity present in rain water is 1 grain to 33 gallons; and that even in pump water, when contaminated with animal impurities, not more than 1 grain to 2 gallons would be present, which is only half the quantity suggested by Liebig.

With regard to rain water, 1 grain of ammonia to 5 gallons,† or 40 lbs., was the proportion indicated by Boussingault's experiments, and consequently 16¼ lbs. only would be imparted to an acre of ground in a year by the rain which falls. To this, however, we ought of course to add the amount at all times floating in the atmosphere, which will be absorbed in greater or less abundance according to the nature of the soil, and here we must undoubtedly look for the advantage which certain soils derive from a careful subdivision, according to Mr. Smith's practice. The amount, indeed, actually present in the atmosphere is exceedingly small,‡ but nevertheless in the course of a year the quantity of air which is brought into contact with the soil is so enormous, that the difficulty of imagining the remaining portion to be thus absorbed becomes very much lessened.

We know indeed from Mr. Lawes' own experiments, that the Turnip crop, in consequence of its wide-spreading leaves, can dispense with ammoniacal manure; and we are therefore, perhaps, entitled to conjecture, that a principle which is collected in such quantities by the leaves of a vegetable, may exist in the air abundantly enough, to enter into combination with a properly prepared soil in quantity sufficient to supply the wants of vegetation.

If so, the original *dictum* of Baron Liebig, which has been so much controverted, may not be incorrect in principle; although the ill success of the mineral manure framed upon this assumption affords a useful lesson, as to the risk we run of failure in applying to practice any general principle, in the present imperfect state of our knowledge of all the bearings of the question; since it undoubtedly appears from Mr. Lawes' experiments, that on ordinary soils, under a common system of cultivation, cereals are benefited by nitrogenous manures, on account of the large quantity of ammonia which is consumed in their growth over and above that which provides them with nitrogen—a fact which Professor Way, in his memoir on the "Power of Soils to absorb Manure," published in the 13th vol. of the Journal of the Royal Agricultural Society, attributes to the necessity of ammonia for rendering silica soluble, and thereby conveying it to the plant in the form in which it can constitute the epidermis of the straw.*

(*To be concluded next week.*)

Home Correspondence.

On Farm Buildings.—A question discussed lately at the London Farmers' Club, "On the best and most Economical Plan of Farm Buildings, which can be recommended to Landed Proprietors," was closed by the only resolution at which it seemed possible to arrive; namely, that the nature of the buildings must depend upon the varied circumstances of farms. But there seems to me in every case a preliminary question; namely, is there *any* plan of farm buildings, which it would be economical to a landlord to provide on the majority of farms? Say, that the buildings are destroyed or worn out, will it pay him to replace them? In fact, the economical question for the landlord is—what is the smallest expense he can be at to secure himself the largest permanent net return? How important a question this must be to a landlord should be clear, when we consider the large amount of landlord capital sunk in a farm, and the small return it secures. The population report gives the average size of farms at 110 acres. The average rent does not exceed 1*l.* per acre. Now, to secure that rent, the landlord must have sunk not less than 800*l.* in a house and buildings with their appurtenances, on which he ought to receive 7*l.* per cent. at least as a builder; and not less than 300*l.* in fencing and roads, on which he might obtain, if otherwise invested, an average interest of say 4*l.* per cent. Besides this, in some shape, cottage tenements, say three, must be provided for the labourers on the farm, at an average cost including fencing of gardens, water, and so forth of say 100*l.* each; which should also give a building per centage of 7*l.* per cent; say 4*l.* paid as rent by the labourers, and 3*l.* derived indirectly from the farm; for it seems to me that it is only on this theory that cottages for farm labourers can be afforded at all, since the rents the labourers pay give no sufficient return for the outlay of capital in cottages. Now the annual interest on these several outlays at the per centages given will amount to a sum of 77*l.* On an average sized farm, therefore, of 110 acres, at a rent of 1*l.* per acre, about 6*s.* 6*d.* per acre would be nearly all the landlord receives as net rent. On many farms of that acreage the whole rent does not amount to the sum of 77*l.*, and capital sunk has really been sunk at a loss. In other words, the land was not worth receiving originally as a gift, if coupled with a stipulation to fence it and erect the necessary buildings.† This would be found to be the case with a good deal of poor country. If landlords, therefore, are to be like all other classes of the community in seeking the best returns for their outlays, it is very clear that they have something more to consider than the most economical plan of farm buildings. Their first question should be what is the most economical distribution of their land. The resolution of this question may lead to a considerable diminution of the number of farms, and a considerable diminution of the agricultural population. The proceeds of agriculture, after deducting generally but a low rate of profit and wages for the farmer and labourer, leaves for the most part so bare an interest on the capital sunk from generation to generation by the landowner, that I am persuaded if outlay on landed property had always been made a matter of calculation, and no outlay had been made on the land by a landowner which did not promise to return as good an interest for his money as any other investment, that there are large extents of England which would never have been enclosed or cultivated, and which would even now make

* The experiments of M. Ville go to establish the contrary, but when we find such discrepancies between the results of his researches on the amount of ammonia in the atmosphere and those of others, we must pause before we adopt his conclusions.

† M. Marten, in the "Ann. de Chemie" for this year, gives nearly the same proportion, viz. 0.003144 gr. per kilogramme of water.

‡ The following statements are given of the proportion of ammonia in air. The enormous discrepancies show that little dependence can be placed on any:—1,000,000 kilogrammes of air, according to Gräger, a chemist of Mulhausen, contain 0.333 kilog. of ammonia; according to Kemp, an Irish chemist, 3,880 kilog.; according to Fresenius 0.098 by day, and 0.169 by night; whilst the recent experiments of M. Ville, which appear to have been conducted with great care, and by the aid of a most elaborate apparatus, make it much smaller, for in the years 1850 and 1851 the average was no more than 23.7 grammes in 1,000,000 kilog., or 0,000,000,0237 to 1, and in 1852 0,000,000,0210 to 1. Thus the several reports will stand as follows:—

In 1,000,000 parts—

Kemp's	3.8800	of ammonia
Gräger's...	0.3330	"
Fresenius's	0.1690	by night
... ...	0.0980	by day
Ville's, from	0.0237	
to	0.0210	

* Silica, according to Way, forms a soluble compound with ammonia, which, however, deposits its silica in an insoluble form as the ammonia flies off. Hence it is first taken up by the juices of the plant and afterwards decomposed in the parts exposed to the air. Now this compound of silica with ammonia is not formed by the direct union of the two bodies, but only through the medium of a compound of silica, either with lime or with alumina, which exists in all argillaceous soils. These silicates, as it appears from Way's experiments, have the property of abstracting carbonate of ammonia from the air, and of retaining its base for the purposes of vegetation. Hence the fertility of the soil will depend upon the presence of these compounds, and according to Way, the advantage of the Tullian practice of pulverising the soil consists in bringing these important compounds of silica which have the power of absorbing ammonia into contact with the atmosphere, and, consequently, producing with them the soluble silicates of the earths with ammonia, which is so important in husbandry.

† [Is not this a *reductio ad absurdum*, either of your reasoning or of the data on which it is founded?]

a larger net return to the owner if allowed gradualllly to fall back into rough pasture or into woodland. *Alexander Hall Hall.*

Societies.

METEOROLOGICAL, *Nov.* 28.—Dr. Lee in the Chair. *Upon the Weather in connection with Aphis Blight and Growth of Hops*, by F. W. Doggett, Esq.—The author commenced by observing that about the spring of the year, 1849, his attention was called to the subject of the aphis blight in Hops, in connection with the fall of rain, by having an extract from Mr. Glaisher's "Quarterly Report of Meteorological Observations" placed in his hands, a copy of which he took; but from a variety of circumstances the matter passed from his mind until the present spring, when, meeting with the extract again, he was struck with the fact of the similarity of the weather of the past autumn with that of the year alluded to in the report, and which was succeeded by a short crop of Hops. The following is a copy of the extract:—"The rain in the quarter ending September, 1848, amounted to 9 inches at Greenwich. The average fall of rain during this quarter, as derived from observations since the year 1815, is 7 inches:—

In the year	1824	the fall of rain in this quarter was				9 ins.
"	"	1828	...	...	...	...	...	12½
"	"	1829	...	...	...	...	...	11
"	"	1839	...	...	...	...	...	12½
"	"	1848	...	...	...	...	...	9

Upon applying at the Greenwich Observatory, the author was furnished with a table containing the monthly fall of rain for 38 years, from which he deduced the average fall of rain for each month per quarter of the above period of 38 years, and compared the quarterly average of each year with the quarterly average of the whole number of years, and found that the years in which an excess of rain had fallen in or about the quarter ending September of the previous year, the quarter ending December and the month of March following being both comparatively deficient, were followed by a short crop of Hops, arising from the aphis blight; and on the contrary, when the quarter ending September of the previous year had been dry, an average or large crop had been grown; when the quarter ending September had been wet, and the December quarter very wet, a like result had followed. The author then became anxious to carry his investigations further back, and obtained from Mr. Glaisher the monthly fall of rain taken at the apartments of the Royal Society from the year 1787 to 1815, which being treated in the same manner yielded similar results. There appear, however, to be a few exceptions to the before-mentioned rules; but on referring to Mr. Glaisher's table of temperature (Phil. Trans., Part 2 for 1850), it was found that the temperatures of the summer quarters of the years in which such exceptions occur, were much below the average of 79 years for the same quarter. For example, take the year 1816. The fall of rain in the quarter ending September of the previous year had been below the average, and therefore a full average crop might have been anticipated; but the quantity grown was short, and on reference to the table of temperature it appears that the summer quarter of the year 1816 was below the average of 79 years by 5° nearly; similar results appear with respect to the following years.

1795	was	2°.2	below the average.
1791	,,	0.5	,, ,,
1799	,,	1.8	,, ,,

When the weather of the previous year has been such as to indicate a blight, there may be partial recovery if the temperature succeeding should be hot, as in the years 1807 and 1849, which were respectively 1°.6 and 1°.0 above the average. On the other hand, the heat may come too late to cause much improvement in the plant, as in the years 1825, 1800, and 1798. On refering to the table of temperature it was found that, with few exceptions, all the small crops were grown in years in which the temperature of the summer quarter was below the average, and the large crops were produced in years in which the temperature of the like period was high. If we take the temperatures of the years in which the 22 smallest crops were grown, and compare them with those of the years which produced the 22 largest crops, we find that, in the first instance, the average produce was equal to 55,728*l.* duty, with an average defect of temperature of the summer quarter of 0°.9, and, in the latter case, the average produce was 211,909*l.*, with an average excess of temperature of 1°.5. The author instanced a few years, comprised within each of the two above instances. The author did not think that we should confine ourselves too strictly within the limits of either month or quarter, in the consideration of this subject, as he found in some cases where a blight has occurred, the fall of rain in the quarter ending September has not always been much in excess; but on referring to the fall which took place in the months immediately previous, he found that the fall of rain had been such as fully to make up such excess, as in the years below:—

1792	March, April, May, June, July, Aug., and Sept.	in excess	(fall 4.2 inches)
1797	June	in excess	(fall 3.2 inches)
1789	,,	,,	(fall 3.8 and 3.5 inches)
1824	May and June	,,	(fall 3.5 inches)
1848	June	,,	

The author concluded by remarking that without doubt the result of each crop is influenced by various circumstances; for instance, the condition of the plant produced by the crop of the preceding year (whether crop or blight), and gales of wind, which reduce the quantity of growth considerably at times, as in the year 1833, when there was a hurricane blowing for three days, August 30, 31, and September 1; during which period the quantity supposed to have been blown away was about one-fourth of the quantity grown.

Miscellaneous.

Fatting Dorkings.—To produce the fat fowls that are seen in greater perfection in the London markets than elsewhere, and which are generally termed (although they are not) capons, Dorkings are cooped for fatting at the age of three to four months in summer and five to six in winter, being fed with oatmeal, mixed with water or milk; this must be given fresh three times a day, the first meal being early in the morning; and, in addition, the birds should be supplied with whole corn (either dry or boiled), gravel, clean water, and a turf or green meat; the most scrupulous cleanliness as to troughs, coops, &c., being observed. By these means a fowl, if previously well fed, will be fat enough for any useful purpose in a fortnight to three weeks; should they be required very fat, some mutton suet, or, what is equally good, the parings of the loins of mutton, may be chopped up with the food. The unnatural process of cramming is frequently recommended, but I have never found it necessary. It should be borne in mind that a fowl cannot be kept in the greatest degree of fatness for any length of time, as the over repletion soon causes internal disease. The houses must be dry, quiet, dark, and warm, and the fatting coops carefully kept from draught, and warmly covered at night during cold weather. *Tegetmeier's Profitable Poultry.*

Calendar of Operations.

DECEMBER.

WESTER ROSS, *Dec.* 12.—The weather for the last few weeks has been particularly wet and boisterous. We have already had two snowstorms, but having come somewhat earlier than usual, they speedily disappeared. Unfortunately, however, along with the thaw we had torrents of rain, and such was the redundancy of water, that drains were burst or overflowed, bank land was cut, and level fields submerged. We have now had a few more settled days, and for some time we expect better weather. The ground has been so wet and cold that Wheat has been making little progress, and a large proportion of it is not yet above ground. The weather although wet has been fresh and open, and the labour of the farm is well advanced. A full average quantity of Wheat has been sown. A large proportion of next year's green crop lot has been turned over, and in some instances leas have been seed-furrowed for Oats. Much of our cultivated land in this quarter being steep, we are in the habit, when ploughing for green crops, of turning it all over with one furrow down hill. In this way, with one pair of horses, we can have our cleaning lot ploughed to the depth of some 12 or 13 inches. Although the horses go up hill without a furrow, there is a respectable speed attained, as a larger breadth can be taken down hill. Our threshing machines have been pretty often at work, and now a fair proportion of the crop has been threshed out. We cannot say that the returns, although satisfactory, are much beyond an average. Wheat threshes out well, and had it not been for our damp summer, and its attendant blight, we would have had an uncommon yield, our light Wheat being more than ordinarily abundant. Last year, at this season, we were all busy shipping Potatoes; this year a few vessels will suffice to take away our surplus stock, and ere the planting season be over, the few we are now shipping will, peradventure, be sadly missed. Sheep were thriving well on Turnips until these storms came, since then their wool has been well nigh constantly saturated, their footing miry, and their bed constantly wet; so that, with all these drawbacks, they have had difficulty in maintaining their former condition. Our Turnip crop being good, it is standing out well. A number of the farmers in this neighbourhood entered into a sweepstakes for the best five acres of Swedes, and the best ten acres of any other kind of Turnips, and the result is the following—of which we can scarcely say that we are ashamed—the best acre of Swedes weighed 27 tons; the best acre of any other sort weighed 29 tons 16 cwt.; whilst the average weight of Swedes was 25 tons 2 cwt.; and that of the other kinds 24 tons 5 cwt. per imperial acre. Meetings on behalf of the Patriotic Fund are being held throughout the north, and there are certainly few classes of her Majesty's subjects that might respond more readily, or contribute more cheerfully and liberally than the agricultural class.

Notices to Correspondents.

BOOKS: *A Young Farmer.* M'Intosh's "Book of the Garden," and the volumes on the "Horse," "Ox," and "Sheep," by the Useful Knowledge Society.

BUTTER: *W H.* Try pouring a lot of hot water into the milk-pan along with the milk, keeping the whole warm for an hour or two before the cream rises. The aroma of the Turnip is said to *go* in the vapour.

COAL-ASH: *Tyro.* Coals vary exceedingly in the quantity of ash they contain, and they cannot be classified as containing much or little respectively, according to the designation you specify; for north country coals vary between 2 and 10 per cent., Newcastle coals between 2 and 9, Lancashire coals between 2 and 11, and Welsh coals between 1½ and 10—the differences being according to the particular bed or mine from which the specimens are taken. Coal-ash is generally so mixed with imperfectly burned material, that it is to be considered useful chiefly for its influence on the texture of the soil.

OIL-CAKE: *Subscriber.* 1 lb. of oil-cake a day per head will, with "steamed straw and a few sliced Turnips, keep young stock in good condition."

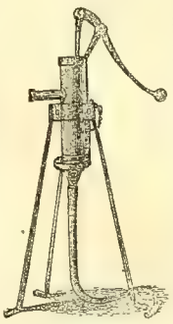
PERMANENT GRASS: *Constant* would feel particularly obliged if any of our correspondents would kindly state the result of their experience on the subject of laying land down to permanent Grass without an accompanying crop of corn. It is important to learn under what circumstances such a proceeding would be desirable or objectionable? whether the superior growth of the Grass would be likely in any degree to compensate for the loss of a crop of corn? whether any other spring crop might be substituted for one of corn? what condition the ground ought to be in? the season for sowing? the quantity of seed, and the after management of the field?—[If you will state the character of the soil, we can give you the kinds and quantities of seed desirable. A thin seeding of Barley along with them will not interfere with the permanent interests of the Grass, and the crop is worth harvesting.]

SEED GROWING: If you do not think that you are offered enough for your seeds, advertise them for sale.

SITUATION: *Inquisitor.* You should advertise your qualifications, giving such references as shall prove that you really possess them: and as to salary, from 80*l.* to 150*l.* is common for the manager of home farms of any extent. We do not know anything as to the counties in which you are likeliest to meet with what you want. You had better advertise in the London agricultural papers.

STEAMING APPARATUS: *W J B.* should communicate with Richmond and Chandler, Manchester.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.



The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ ,,	long 3 ,, 3 ,,		1	15	0
3 ,,	ditto 3 ,, 6 ,,		2	12	0
3½ ,,	ditto 3 ,, 6 ,,		2	18	0
4 ,,	ditto 3 ,, 6 ,,		3	5	0
2½ ,,	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto ditto		2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

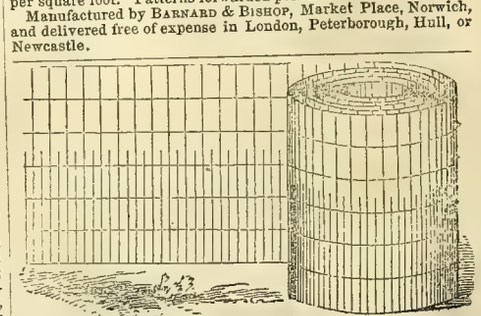
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1⅝-inch ,, light ,, ...	8 ,,	6 ,,
1⅝-inch ,, strong ,, ...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.



MANCHESTER POULTRY SHOW.

B. GREENING AND CO., the Contractors for fitting up this Show, beg to invite visitors to inspect the patterns of their Patent Fencing, exhibited by kind permission of the Committee in the Free Trade Hall during the days of Exhibition. Orders can be left with the attendants, and Price Lists and Pattern Sheets of the various kinds may be previously obtained by post on application to B. GREENING & Co., 1 and 3, Church Gates, Manchester.

B. GREENING & Co's Poultry Show Pens are engaged for the Manchester Poultry Show. Pens bought during the Show will be sent home immediately after. Price of pens, 6*s.* 6*d.* each, applicable to showing Poultry in as well as for hen coops, chicken feeding cages, &c.

Subscribers' names to B. G. & Co.'s Subscription List for reducing the price of the pens to 5*s.* 6*d.* each, will be received by the attendants in the Hall.

B. GREENING & Co., Church Gates and Cateaton Street, Manchester.

PRIZE MEDAL—1851.

AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

JAMES PHILLIPS & Co.,

116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

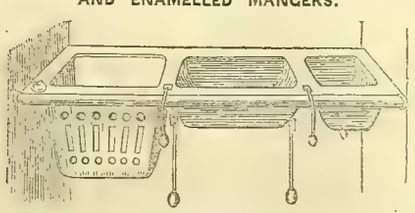
"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge.

ESTABLISHED A.D. 1700.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.



THE only Patented invention of this description constructed so as to prevent considerable waste of Hay and Corn, together with all the newest improvements.

NEWLY IMPROVED ECONOMIC STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.

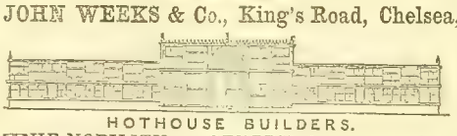
Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 35*s.* each. Price Lists and Illustrated Catalogues forwarded on receipt of two postage stamps.

JAMES BARTON, IRON FOUNDER, &c., 370, Oxford Street, a few doors east of the Pantheon.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

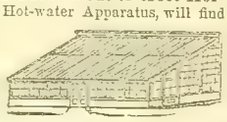
HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

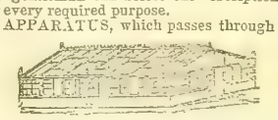


HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the escription of House best adapted for every required purpose.



The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.



Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

EXOTIC NURSERY, CHELSEA.

JAMES VEITCH, JUN., having engaged in addition to his other able foremen, the assistance of Mr. John Milne, late gardener to Byam Martin, Esq., of Kingston-on-Thames, and before that gardener and steward to the Right Hon. the Earl of Clare, Mount Shannon, Ireland, feels *increased confidence* in being able to give complete satisfaction to those who may kindly patronise him.

The long and extensive *practical experience* which he has himself had at Exeter, as well as since he came to Chelsea, combined with Mr. Milne's high standing as a *practical gardener*, induces him to tender his services to any lady or gentleman requiring advice in the *Improvement of their Gardens and Grounds, and in other Horticultural matters*, particularly in reference to the erection of Conservatories, Forcing and Plant Houses, Heating Apparatus, &c., plans for which will be furnished on application, and examples can be seen both at the Exotic Nursery, Chelsea, and at Exeter.

JAMES VEITCH, JUN., is fully impressed with the fact that to make Horticultural Buildings what they really should be, *thorough practical Gardening experience* is required to adapt the various erections to the several purposes for which they are intended. This desirable object it will be his anxious endeavour to accomplish.—Dec. 23.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the CRYSTAL PALACE, SYDENHAM, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. CONSERVATORIES AND AVIARIES fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. WINDOW BLINDS of every possible description, of the very best materials and workmanship.

N.B. An allowance to nurserymen and the trade.

CHRISTMAS PRESENTS.—The most appropriate offerings for this season of festivity are those which tend to the promotion of health and personal attraction: none can be more acceptable than ROWLANDS' MACASSAR OIL, for imparting a transcendent lustre to the hair, and sustaining it in decorative charm. ROWLANDS' KALYDOR imparts a radiant bloom to the cheek, and a delicacy and softness to the hands, arms, and neck; and ROWLANDS' ODONTO, OR PEARL DENTIFRICE, bestows on the teeth a pearl-like whiteness, and renders the breath sweet and pure. The patronage of royalty throughout Europe, their general use by rank and fashion, and the universally-known efficacy of these articles give them a celebrity unparalleled.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.—Beware of spurious imitations.

IRON PIPES, IRON AND WOOD FENCING.

WILSHERE'S BLACK VARNISH goes twice as far as paint, 4*s.* per gallon.

N.B.—Several orders having, by an accident, been destroyed, the parties ordering will oblige by repeating them.

2, Talbot Court, Gracechurch Street, London.

CURE FOR GRAPE MILDEW.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to say he will send a receipt for the above Composition to dress Vines for Eight Stamps. It has not failed these four years, and only costs a few pence for three or four houses, running no risk of over-sulphuring.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1*l.*—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square.

HOT-AIR, GAS, VESTA, JOYCE'S STOVES.—STOVES for the economical and safe heating of halls, shops, warehouses, passages, basements, and the like, being at this season demanded, WILLIAM S. BURTON invites attention to his unrivalled assortment, adapted (one or the other) to every conceivable requirement, at prices from 10*s.* to 30 guineas. His variety of register and other stoves is the largest in existence.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

CUTLERY WARRANTED.—The most varied assortment of TABLE CUTLERY in the world, all warranted, is on Sale at WILLIAM S. BURTON'S, at prices that are remunerative only because of the largeness of the sales; 3¼-inch ivory-handled table knives, with high shoulders, 11*s.* per dozen; desserts to match, 10*s.*; if to balance, 1*s.* per dozen extra; carvers, 4*s.* per pair; larger sizes, from 14*s.* 6*d.* to 26*s.* per dozen; extra fine, ivory, 32*s.*; if with silver ferrules, 37*s.* to 50*s.*; white bone table knives, 7*s.* 6*d.* per dozen; desserts, 5*s.* 6*d.*; carvers, 2*s.* 3*d.* per pair; black horn table knives, 7*s.* 4*d.* per dozen; desserts, 6*s.*; carvers, 2*s.* 6*d.*; black wood-handled table knives and forks, 6*s.* per dozen; table steels, from 1*s.* each. The largest stock in existence of plated dessert knives and forks, in cases and otherwise, and of the new plated fish carvers. Also a large assortment of Razors, Penknives, Scissors, &c., of the best quality.

LAMPS OF ALL SORTS AND PATTERNS.—The largest, as well as the choicest, assortment in existence of FRENCH and ENGLISH MODERATEUR, PALMER'S, CAMPHINE, ARGAND, SOLAR, and other LAMPS, with all the latest improvements, and of the newest and most *recherché* patterns, in ormolu, Bohemian, and plain glass, or papier-mâché, is at WILLIAM S. BURTON'S, and they are arranged in one large room, so that patterns, sizes, and sorts can be instantly selected.

Real French Colza Oil, 5*s.* per gallon.

Palmer's Candles, 9*d.*, 9½*d.*, and 10*d.* per lb.

DISH COVERS AND HOT-WATER DISHES in every material, in great variety, and of the newest and most *recherché* patterns. Tin Dish Covers, 6*s.* 6*d.* the set of six; Block Tin, 12*s.* 3*d.* to 28*s.* 9*d.* the set of six; elegant modern patterns, 34*s.* 0*d.* to 58*s.* 6*d.* the set; Britannia Metal, with or without silver-plated handles, 76*s.* 6*d.* to 110*s.* 6*d.* the set; Sheffield Plated, 10*l.* to 16*l.* 10*s.* the set; Block Tin Hot-water Dishes, with wells for gravy, 12*s.* to 30*s.*; Britannia Metal, 22*s.* to 77*s.*; Electro-plated, on Nickel, full size, 11*l.* 11*s.*

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

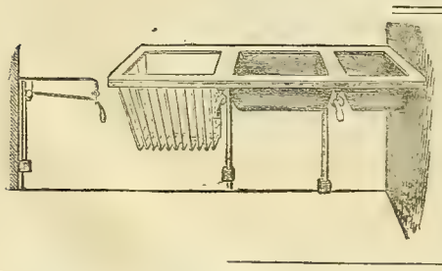
Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.



COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, as one Fixture, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest.

COTTAM'S ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.

IMPROVED PUMPS,

OF THE BEST WORKMANSHIP AND WARRANTED.

The VALVES and SUCKERS of these Pumps are constructed upon an entirely new and SIMPLE principle; they are not likely to get out of order; should they do so, can easily be repaired, as the Pump is so contrived that the valves can readily be got at.

An Improved CAST IRON TRAP, strongly recommended by the Sanitary Commissioners, and suitable for Sugar Bakers, Slaughter Houses, &c. &c. It is so formed that the Trap-plate will pass any matter the top grating will let through, and therefore is not liable to stoppages; and well adapted to Stables and Stable-yards, for saving the best part of Liquid Manure.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

WANTED to Rent, from Lady Day, a SMALL FARM near London, from 40 to 80 Acres, chiefly Pasture, with a good House upon it and the requisite Outbuildings; and not more than 16 miles from town.—Apply, by letter, to the Editor of the *Agricultural Gazette*, 5, Upper Wellington Street, Strand, London.

TO BE SOLD, the BOAR of the small breed which has just obtained the first prize at Reading; aged 8 months. Also, the sire of the same, aged 20 months, of the improved Dorset breed, bred by Mr. Coate. They are both remarkably fine pigs.—Apply to Mr. Horne, Egham, Surrey.

TO COCHIN CHINA FOWL AND PIGEON FANCIERS.
TO BE SOLD a few very large and first-rate CINNAMON and BUFF COCHIN CHINA FOWLS. Also a collection of PIGEONS which have been selected from pure Birds, and at very considerable expense. They consist of Owls, Nuns, Jackobines, Almond Tumblers, Horsemen, Pantails, (white and black), Barbs, and Archangels.—Address, prepaid, A. B., Post-office, Atherstone, Warwickshire.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at Metcalfe, Bingley, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.
Caution.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as Emily Dean's CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2*s.* per Package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss Dean, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of moustachios." H. Adams.—"It has prevented my hair falling off." J. Hickson.—"It has quite checked the greyness that was coming on." Mrs. Elder.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, &c.?—COUPELLE'S CRINUTRIAR, though extensively imitated, is universally acknowledged as the only preparation to be really depended upon for the unfailing production of Hair and Whiskers in two or three weeks; as also checking Greyness, Baldness, &c., and rendering the Hair beautifully luxuriant, curly and glossy. Mr. Williams, 8, Lowther Street, Liverpool.—"I can now show as fine a head of hair as any person, solely from using your Crinutriar." Sergeant Craven, Longford Barracks, Ireland.—"Through using your Crinutriar, I have an excellent Moustache, which I had before despaired of." Mrs. Carter, Pangbourne, Berks.—"My head, which was quite bald, is now covered with new hair." Price 2*s.* per package, through all Druggists and Perfumers, or sent post free on receipt of 24 penny stamps by Rosalie Coupelle, 69, Castle Street, Newman Street, Oxford Street, London.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, ELLEN GRAHAM'S NIOUKRENE is unfailing in its efficacy. It reproduces the hair when lost by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce Whiskers, Moustachios, &c., in three or four weeks. For beautifying the hair, and sustaining its curling powers, it has no equal. Sent post free on receipt of 24 penny post stamps, by Miss Graham, 10, Chichester Place, King's Cross, London. "My whiskers are greatly improved." J. Short, Dudley.—"It has produced hair where I was bald." W. Morgan, Milford.—"My hair has thickened since using it." Miss Cowie, Bridgewater.—"I have a full pair of whiskers." H. Robb, Hertford.—"It has effectually checked the greyness." Mrs. Hood, Dorking.

IT IS THE PECULIAR CHARACTERISTIC OF PARR'S LIFE PILLS that they purify the system mildly and imperceptibly, so that there is no reaction or tendency to constipation afterwards, as is the case with the purgatives administered by many apothecaries. There are instances of persons with diseased livers and tender lungs who have passed years of misery, pain, and apprehension, but who, after taking Parr's Life Pills, have actually been made whole, the liver having resumed its proper functions. For Bilious Disorders, Liver Complaints, Indigestion, Costiveness, Sick Headache, Depression of Spirits, Pains in the Back, Gravel, and Lumbago, Parr's Life Pills will be found a safe and admirable remedy. Invalids should make an immediate trial of this excellent, long-tried, and successful medicine.
Sold by E. Edwards, 67, St. Paul's Churchyard; Barclay and Sons, Farringdon Street; Sutton and Co., Bow Churchyard; Hannay and Co., 63, and Sanger, 150, Oxford Street, London; and by all respectable chemist and medicine vendors in town or country.—In boxes, price 1*s.* 1½*d.*, 2*s.* 9*d.*, and in family packets 11*s* each. **** Be sure to ask for Parr's Life Pills.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and give a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1*s.* 1½*d.* per box.—Observe that "Thomas Prout" is on the Government stamp.

HOLLOWAY'S PILLS, A SURE REMEDY FOR INDIGESTION, BILE, AND DISORDERED STOMACHS.—Mr. Patrick O'Brien, of Newtownards, had frequent attacks of Bile and Indigestion, particularly after indulging freely in the luxuries of the table; his appetite was good but his digestion weak, which obliged him to have recourse to medicine, as oft-changed as told, for he seldom obtained more than temporary relief, relapsing again into the same unpleasantness. Holloway's Pills were recommended to him after all, and it is quite astonishing to see the benefit he has derived from them, as he can now eat indiscriminately without fear of suffering from his former ailments.—Sold by all Vendors of Medicine, and at Professor Holloway's Establishment, 244, Strand, London, and 80, Maiden Lane, New York.

FORD'S EUREKA COLOURED SHIRTING is now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.
FORD'S COLOURED EUREKA SHIRTS, Six for 27*s.*
FORD'S WHITE EUREKAS, best quality, Six for 40*s.*; second quality, Six for 31*s.*; if washed ready for use, 2*s.* extra.
Caution.—Ford's Eureka Shirts are stamped, "38, Poultry, London," without which none are genuine.
**** Catalogues with particulars post free.
Richard Ford, 38, Poultry, London.

VALUABLE REMEDIES FOR THE AFFLICTED.
DR. ROBERTS'S Celebrated Ointment, called the POOR MAN'S FRIEND, is confidently recommended to the Public as an unfailing remedy for wounds of every description, a certain cure for Ulcerated Sore Legs, of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples on the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1*s.* 1½*d.* and 2*s.* 9*d.* each.
Also his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience to be, without exception, one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are used in Scrofulas, Scorbutic Complaints, Glandular Swellings, particularly those of the neck, &c. They form a mild and superior Family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s*, and 22*s.* Sold Wholesale by the Proprietors, Beach and Barnicott, at their dispensary, Bridport; by the London houses. Retail by all respectable Medicine Vendors in the United Kingdom.
Observe.—No Medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott, late Dr. Roberts, Bridport," is engraved on the Government Stamp affixed to each package.

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1*s.* 1½*d.* and 2*s.* 9*d.* per box.—Mr. William Courtney, of Barton Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills; they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "Thomas Prout, 229, Strand, London," is impressed upon the Government stamp.

PETER PARLEY'S TALES ABOUT EUROPE, ASIA, &c.
In one large Pocket Volume, embellished with numerous Illustrations and Maps engraved on Steel, a New Edition, with great Additions, price 5*s.*, in cloth, and gilt edges,
PETER PARLEY'S TALES ABOUT EUROPE, ASIA, AFRICA, AMERICA, AND OCEANIA.
**** "The design of this work is to convey, by conversational remarks, a knowledge of Geography and History; it is interspersed with personal adventures, and adapted to the taste and knowledge of children. The author never fails to win attention and raise curiosity; he then uses such familiar terms in gratifying it, that the rudiments of Geography are insensibly impressed on the mind, and science is rendered a pleasing study."
London: William Tegg & Co., 85, Queen Street, Cheapside.

D. M. Walker, Printer, Gloucester; Ridgway & Co., Publishers, London. Price 1*s.*

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1855, *with Newspaper Stamp to go Free by Post, is now in the Press, and will be Published on* TUESDAY, *December* 26.
The proprietors of this well-known Publication have endeavoured, in the present edition, to render it even more complete than the last; and have again obtained the valuable assistance of Mr. Robert Errington, Gardener to Sir P. Egerton, Oulton Park, who is acknowledged to be one of the best practical writers on Horticulture of the day.
It will contain a very valuable descriptive list of KITCHEN GARDEN SEEDS, with prices affixed to every article, and in addition to the descriptions, there will be short and concise cultural remarks for every kind of Vegetable, pointing out the best varieties for early, medium, and general crops.
The List of FLOWER SEEDS has been much improved, and contains descriptions of all the leading sorts, with directions for sowing seeds, and other useful practical remarks; and in this department Mr. Errington has written expressly for the work an original article on ANNUAL AND OTHER FLOWER SEEDS, which will be read with much interest.
The Calendar of Operations for the whole of the year has also been revised, and will be found even more useful than the one in the last edition.
There will be a good Garden ALMANACK as usual, and the detailed quantities of seeds contained in their useful COLLECTIONS OF SEEDS are given in full.
A valuable report of the experiments in their Trial Grounds is also given, and descriptions of the NEWLY INVENTED CLOCHE, or Hand Glass, and of the new CHINESE POTATO (Dioscorea Batatas). The following original articles have also been written expressly by Mr. Errington—on VEGETABLE FORCING, LIGHT AND AIR, LIQUID MANURE, and ROTATION OF CROPS. And in addition to the above, the proprietors have been favoured with an original paper by J. B. Lawes, Esq., of Rothamstead Park:—"On the Artificial Manures most Suitable for the Growth of Barley."
At the request of several correspondents the Publishers have printed the present Edition the size of the "Gardeners' Chronicle," so that those who wish it can bind it with the present volume of that valuable Paper. It will contain 32 folio Pages, "Chronicle" size.
Copies can be obtained after Tuesday next, price 6*d.* each, or free to purchasers of seeds; and can be obtained through the medium of any bookseller in the United Kingdom, from the
LONDON PUBLISHING OFFICE, 294, STRAND;
Or from the Proprietors, William E. Rendle & Co., Seed Merchants, Plymouth.

A SUPPLEMENT, GRATIS, WITH THE WEEKLY DISPATCH, EVERY WEEK UNTIL FURTHER NOTICE.—The unexampled interest which attaches to every incident connected with the operations of the Allied Armies in the East has determined the Proprietors of the Weekly Dispatch to devote a greater space to the intelligence from the seat of war than the ordinary limits of this, the largest newspaper published, could possibly afford; and, with the view of giving the amplest details, they have resolved upon the issue of a SERIES OF SUPPLEMENTS, GRATIS, which will include every particular of interest connected with the Siege and decision of the contest at Sebastopol, and will be continued whenever demanded by the progress of the Campaign.
By the publication of these Supplements the portion of the Paper usually devoted to incidents of domestic and political importance will be reserved intact, and the engrossing subject of the War will receive the fullest and most varied illustration.
A Supplement will be Published on Sunday next (Gratis), and on every succeeding week until further Notice.—Orders may be given to all Newsvendors in town and country; and to the publisher, at the *Dispatch* Office, 139, Fleet Street, London.

Illustrated London News.
THE YEAR 1855 bids fair to be one of the most important and eventful of modern history. On the 6th of January, 1855, will be issued the first number of a new volume of the Illustrated London News, and not merely a new volume, but of a New Year—each volume being perfect and complete in itself—containing, for the time, a faithful record, pictorial and descriptive, of all Events of Interest in every part of the world. To that limited portion of the public who do not subscribe to this Journal it may be stated that no period could be selected more opportune for commencing,—the whole expense being but 26*s.* per annum, exclusive of double numbers, which are issued on rare occasions, when it would be impossible to crowd the important events and Engravings into a single number; for this small sum the subscriber will receive 24 large pages—72 columns—of the most interesting information, carefully selected from the News of the Week, interspersed with a variety of charming Articles on the chief topics of the day.
The Illustrated London News has, by its impartial and consistent advocacy of the welfare of the public, secured for itself a political influence scarcely second to any Newspaper in the Empire; and reference can, with some pride, be made to the support afforded to all beneficial measures proposed and adopted by the English Parliament.
Foreign Politics will ever command the attention which ought to be devoted to so important a feature of a Newspaper. On the question of the Russian War, during the year 1854, ONE THOUSAND ENGRAVINGS appeared in the Illustrated London News. Extensive arrangements, calculated to improve this popular Journal, and engagements such as will greatly enrich its Literary, Scientific, and other departments, have been made, and will thus combine on this Paper the greatest talent of the day.
The Illustrated London News has been established 13 years, during which period it has received a greater degree of encouragement and approbation than any Journal ever published. This is proved by the Return of Stamps issued from time to time by order of Parliament. The Stamps applied for the first six months of 1854 were upwards of 2,734,000—showing a WEEKLY CIRCULATION OF UPWARDS OF ONE HUNDRED AND THIRTY THOUSAND COPIES!
Terms (for payment in advance)—Half-year, 13*s.* 6*d*; Year, 26*s.*
Any of the Volumes of the Illustrated London News, from the commencement to the present time, may now be had, in paper or cloth. Covers for Binding the Volumes 2*s.* 6*d.* each.
All Numbers may be sent free by post to any part of the Kingdom and the Colonies.
Give an order for six months to ensure all the gratuitous Prints and Supplements. Supplied by all Booksellers and Newsmen.
The Illustrated London News is published in London every Saturday, stamped, to go free by post, 6*d.* per copy.
Office, 198, Strand, London.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1855 *will be published on* TUESDAY *next, December* 26. *Price* 6d. *; to be had of all Booksellers, and from* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth.*

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

FLEMING'S HYBRID CASHMERE MELON.—The above new Melon was raised by Mr. Fleming at Trentham, and exhibited by him for the first time at the Great Meeting of the Horticultural Society of London at Chiswick on the 10th June last against a multitude of competitors, when it was awarded the first prize, and pronounced by the judges to be very far superior to all others produced, and decidedly the best Melon known. The entire stock is in the hands of the undersigned. Packets of Six Seeds, 2*s.* 6*d.*; of 15 do., 5*s.*

R. GLENDINNING, Chiswick Nursery, London.

GARAWAY, MAYES, AND CO. having succeeded in saving some fine SEEDS of that truly magnificent Lily, LILIUM GIGANTEUM, which are now well matured, they offer fine picked Seed at 25*s.* per 100. Fine, new, long prolific Cucumber Ne Plus Ultra, Victory of Bath, do. Syon House, Lord Kenyon's Favourite, Roman Emperor, Berkshire Champion, Manchester Hero, Pollington's Black Spine, Pollington's Early Prolific. Victory of Bath Melon, Bromham Hall, Cameron Court Green-flesh, Beechwood, with all other most approved kinds in cultivation, 1*s.*, 1*s.* 6*d.*, to 2*s.* 6*d.* per packet.

Durdham Down Nursery, Bristol, Dec. 23.

SPECIMEN IRISH YEWS.

THOMAS JACKSON AND SON, having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

S to 9 feet high, and S feet in circumference...			63*s.*	0*d.*	each.
8	"	and 4 to 5 feet	" ... 21	0	"
7 to 8	"	and 4 feet	" ... 15	0	"
6 to 7	"	and 3 to 4 feet	" ... 10	6	"
6	"	and 3 feet	" ... 7	6	"

Handsome smaller specimens at proportionately lower prices.

Kingston, Surrey.

J. LANCASTER, MARKET GARDENER, Edward Street, Deptford, begs to offer the following Surplus Stock of ASPARAGUS, &c.:—

Five Thousand 3-year old ASPARAGUS, planted expressly for Forcing, per 100	8*s.* 0*d.*
SEAKALE, ditto ditto	7 0
SEEDLING ASPARAGUS, ditto	2 0
SEEDLING KALE ditto	2 6
WALCHEREN CAULIFLOWER SEED, warranted very true, per lb.	12 0

GODFREY'S BLACK SPINE.
SPLENDID AND PROLIFIC FRAME CUCUMBER.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom: average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2*s.* 6*d.*; 6 ditto, 1*s.* 6*d.*

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. HURST & M'MULLEN, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1*s.* each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, Dec. 23.

MANGOLD WURZEL SEED.

TO BE SOLD, LONG RED and YELLOW GLOBE, this year's seed, from superior stock.—Apply to R. S. HEWS, Kelvedon, Essex.

EARLY SEED POTATOES.—Jackson's Improved Thorough High-bred Early Ashleafs, price 9*s.* per bushel, and the celebrated Short-tops, 7*s.* 6*d.*, are unequalled for quality and yield; they by far surpass the "old stock," which is generally a sluggish bearer. British Queens, 7*s.* 6*d.*, the earliest round variety, known; Early Frame and Ashleaf Seedlings, 8*s.*; Regents, from prepared cuttings, 6*s.* Free to London; no charge for sacks. All orders must be accompanied with a remittance.—JOSEPH WILSON, Seedsman, Ipswich.

FIVE HUNDRED BUSHELS OF POTATOES TO THE ACRE.—This enormous crop was grown this year by a gentleman in Surrey, and out of which there were only 5 bushels diseased; nearly all the quantity were large sized, some weighing 2 lbs. and 1 oz., and not above 30 bushels of Chats out of the whole. This Potato was originally reared in Scotland, and is called by its grower the Scottish Champion. It is a good baker and boiler. Price 2*l.* 2*s.*, inclusive of the sack of 3 bushels, delivered free at the South Western Railway station in London. Early application is necessary, as only a few sacks are for sale, the party growing intending to plant largely next season. A reference as to the quantity and quality can be given in the neighbourhood.—Apply by letter, post-paid, to B. S., 4, Crooked Lane, London Bridge, where samples may be seen, and the name of the grower given.

All orders must be accompanied by a remittance.

BEAUTIFUL NEW PLANT.

LUCOMBE, PINCE, AND Co., are now prepared to send out their beautiful New VERONICA KERMESINA, raised by that eminent Horticulturist, J. Luscombe, Esq., of Coombe Royal, who sent specimens to Dr. Lindley at the time of its first flowering, who thus pronounced his first opinion of it:—

"*The variety sent with this was charming; a decided rose colour having mingled with the violet.*"

See also notice of Dr. Lindley in the *Chronicle* for December 2d, 1854, as follows:—

"*L., P., and Co.: Your V. Kermesina is a handsome dark variety of V. Speciosa, its beautiful large spikes of deep purplish crimson blossoms cannot fail to make it a favourite.*"

Price 7*s.* 6*d.* each.—A few extra sized specimens may be had. The usual discount to the trade when three or more are taken.

Exeter Nursery, Exeter, Established 1720.

PINES READY FOR MARKET.

GROWERS having the above Fruit for sale, will do well to apply or forward to GEORGE TAYLOR, Jun., Fruit Salesman, St. John's Market, Liverpool.

PIG RICE, 9*l.* per ton; 10*s.* per 112 lbs. POULTRY RICE; 14*s.* per 112 lbs. in bags of 168 lbs.; RICE MEAL, 8*l.* 10*s.* per ton.

At WILSHERE'S, 2, Talbot Court, Gracechurch Street, London.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

Now ready, price 3*d.*, or Stamped 4*d*,

GARDENERS' BENEVOLENT INSTITUTION.
SEVENTH APPLICATION.

HENRY SCHNEIDER, of Ford, Colerne, Chippenham, through his Advertisement, again appeals to the sympathy and kind support of the Subscribers of this Institution, being now 90 years of age, and in very destitute circumstances. His testimonials remain unimpaired, and he is encouraged to make another application to his kind friends who have hitherto favoured him with their votes, and other subscribers who will charitably lend him their aid at the forthcoming election in January next.

The following gentlemen will be gratified in receiving proxies in his favour:—Mr. Gregory, Cirencester, Gloucestershire; Mr. Burbank, Grittleton, Chippenham, Wilts; Mr. Spencer, Bowood, Calne, Wilts; Messrs. Garraway, Mayes, & Co., Bristol; Mr. Trotter, Badminton, Chippenham, Wilts; Messrs. Arthur Henderson & Co., Pine Apple Place, and John Arthur Henderson, Esq., 64, Hamilton Terrace, London.

PRIVETS.

WANTED, about 20,000 of the above Plants, from one to two years, from cuttings well rooted.—Address, stating terms, &c., to BROWN & TAYLOR, Nurserymen, Hackney, London.

WANTED, PINASTER AND STRONG TRANSPLANTED QUICK.—Any party having stock of the above, stating size and price, will oblige R. WHITE, Nursery, Poole.—December 30.

WANTED, AMERICAN ARBOR-VITÆ, about 1 foot high. Quantity to offer, with price per thousand, may be addressed to HUGH LOW & Co., Clapton Nursery, London.

LARGE STOCK OF LARCH.

LUCOMBE, PINCE, AND CO., have a very large stock of fine, stout, well-rooted twice-transplanted Larch, from 2 to 3 feet and 3 to 4 feet high, which they can offer at very low prices. Particulars may be had on application to the Exeter Nursery, Exeter. Established 1720.

FINE TRAINED FRUIT TREES IN A BEARING STATE.

LUCOMBE, PINCE, AND CO., have this season for Sale a remarkably healthy stock of fine trained FRUIT TREES of all the best sorts, to which they respectfully beg to call immediate attention. Prices and particulars to be had on application to LUCOMBE, PINCE, & CO., Exeter Nursery, Exeter. ESTABLISHED 1720.

SEEDLING FOREST TREES AND SHRUBS.

DAVID REID AND SON, NURSERYMEN AND FLORISTS, Leith Walk, Edinburgh, beg to direct the attention of the trade to their Stock of Seedlings as above.
Catalogues free on application.

FRUIT TREES, FOREST TREES, EVERGREEN SHRUBS, &c. Catalogues of the above may be had on application to WILLIAM BARRATT, Wakefield.

☞ A quantity of fine Transplanted White Thorns.

SPECIMEN IRISH YEWS.

THOMAS JACKSON AND SON, having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

8 to 9 feet high, and 8 feet in circumference			...	63*s*. 0*d*.	each.
8	,,	and 4 to 5 feet	,,	... 21 0	,,
7 to 8	,,	and 4 feet	,,	... 15 0	,,
6 to 7	,,	and 3 to 4 feet	,,	... 10 6	,,
6	,,	and 3 feet	,,	... 7 6	,,

Handsome smaller specimens at proportionately lower prices.
Kingston, Surrey.

LARCH AND SPRUCE TREES.

TO BE SOLD by private contract, at Edgefield, near Holt, Norfolk, 250,000 Excellent LARCH PLANTS, transplanted, 2 to 4 feet; 20,000 ditto SPRUCE ditto, ditto, 1 to 3 feet. —For price, &c., apply to Mr. ALEX. LAWRIE, Edgefield; if by letter, to be post paid.

PINE PLANTS.

TO BE SOLD, about 200 PINE PLANTS in fine order, principally the Bacaxi, a very superior sort from the North of Brazil. Would be exchanged for good Greenhouse Plants.—Apply H., 25, Faulkner Street, Manchester.

MANGOLD WURZEL SEED.

TO BE SOLD, LONG RED and YELLOW GLOBE, growth of 1854, from superior stock.—Apply to R. S. HEWS, Kelvedon, Essex.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY for 1855 *is now published, price* 6d. *To be had of all Booksellers, and from*
WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth.*

LILIUM LANCIFOLIUM, NEW GLADIOLI, AND OTHER BULBS FOR SPRING PLANTING.
See SUTTON & SON'S Seed and Plant List, just published, price 6*d*., or gratis to purchasers.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

TO THE SEED TRADE.

ABRAHAM HARDY AND SON, SEED GROWERS, beg to announce that their Wholesale Priced CATALOGUE of SEEDS, growth 1854, is now ready, and may be had on application.—Maldon, Essex, December 30.

EXOTIC NURSERY, CHELSEA.

JAMES VEITCH, JUN., will be happy to forward his new Retail VEGETABLE, AGRICULTURAL, AND FLOWER SEED LISTS on application, and desires to assure those who may kindly favour him with their orders, that he has spared no pains in procuring his supplies from the first growers on the Continent as well as in this country, and that he will use his best endeavours to give his customers entire satisfaction.

TO THE SEED TRADE.

DAWE, COTTRELL, AND BENHAM'S (successors to Frederick Warner) Wholesale LIST OF AGRICULTURAL AND GARDEN SEEDS is now ready.—3, Laurence Pountney Lane, London. Established 1720 at 28, Cornhill.

DAWE, COTTRELL, AND BENHAM'S Wholesale FLOWER SEED CATALOGUE is now ready for the Trade. Post free on application.—3, Laurence Pountney Lane, and 36, Moorgate Street, London.
Established 1720 at 28, Cornhill.

SEED GROWERS' SOCIETY.—The Members of the above Society are now prepared to send LISTS of AGRICULTURAL, GARDEN, and FLOWER SEEDS to those who are desirous of having them genuine and direct from the Growers.—Applications addressed to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex, will meet with prompt attention.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.
P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

GERMAN FLOWER SEEDS.

MOSCHKOWITZ AND SIEGLING, Erfurt, beg to inform the trade that their new Wholesale Catalogue of Choice German and other Flower Seeds, is now ready, and may be had on application to their Agent, Mr. H. HENKEL, 70, Fenchurch Street, London.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.
The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.
G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.
WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

NONPAREIL PEAS.

WILLIAM FAIRBEARD begs to inform the trade that he is now ready to execute any orders he may be favoured with. This Pea W. F. is confident will become a general favourite both for Garden and Field culture. Price can be had on application.—Mount Pleasant Nursery, Queen Street, Sittingbourne, Kent.

SEED WHEAT.—Samples and Prices of RED HYBRID, NURSERY, and other kinds of Wheat from the CHALK, sent on application to Mr. H. RAYNBIRD, Basingstoke.
The Red Hybrid and Nursery are well suited for late sowing after Turnips.

GLENNY'S SUPERB BALSAM SEED from the largest and most double Flowers in the world. Six classes, 37 stamps; 50 seeds mixed, 13 stamps—in sealed packets only—with Directions for Culture.—Letters to Mr. GLENNY, Horticultural Agent, Auctioneer, and Valuer, Dungannon House, Fulham.

THE PAMPAS GRASS "CYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND CO. have a fine healthy stock of this highly ornamental Plant, well established in pots, and fit to send out immediately. It is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See woodcut and description of it in *Gardeners' Chronicle* of the 4th ult.—Sizes, prices, and all particulars may be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.
ESTABLISHED 1720.

SEED POTATOES.

SUTTON AND SONS, SEED GROWERS, Reading, have a large STOCK of the best early kinds of POTATOES, very true and free from disease. Prices, &c., with instructions on cultivation, will be found at page 20 of SUTTON'S Seed and Plant List, just published, price Sixpence (or gratis to purchasers).
SUTTON and SONS, Seed Growers, &c., Reading.

CHINESE POTATO, DIOSCOREA (JAPONICA) BATATAS.

SUTTON AND SONS have the pleasure of announcing that they have imported a stock of roots of the above valuable esculent, and can supply them at moderate prices, particulars of which will be seen at p. 41 of their new Seed and Plant List. The stock being limited, Messrs. SUTTON will consider it due to those who usually honour them with their commands, that they should have the preference, in the event of the demand being greater than the supply; for which purpose it is desirable that orders should be given immediately.
SUTTON and SONS, Seed Growers, Reading.

DIOSCOREA BATATAS—THE NEW CHINESE POTATO.—This new esculent was fully described by Professor Lindley in the *Chronicle* last week.

The Subscribers are now importing a choice lot of Roots, and can supply them on the following terms:—

Four Tubers	...	£0 10 0	Fifty Tubers	...	£5 5 0
Ten ,,	...	1 2 6	Hundred ,,	...	10 0 0

First Orders will have the best Roots.—Apply to
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND Bradshaw Gardens, Middleton, near Manchester.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.
To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

NEW SEEDS JUST HARVESTED *can now be obtained of the most genuine description, from*
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

LYNCH'S STAR OF THE WEST CUCUMBER, *the best frame variety in cultivation. For description, see* RENDLE'S "*Price Current and Garden Directory*" *for* 1854.
Price 1*s*. 6*d*. and 2*s*, 6*d*. per packet.—Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

ARTHUR HENDERSON AND CO. beg leave to inform their patrons and friends that their Stock of VEGETABLE and FLOWER SEEDS (containing many choice and new kinds) is now ready for sending out.
Their Seeds may be fully relied on as being in every respect of first-rate quality, and true to their sorts. Catalogues may be had on application.
Pine Apple Place, Edgeware Road, London.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s*. per lb.; smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

DILCOCK'S BRIDE BROCCOLI.
SIXPENCE PER PACKET.

BAINBRIDGE AND HEWISON (Proprietors of this far-famed Broccoli), beg to inform their friends and customers that they are prepared to send it out this season from selected stock of their own growth. The trade can have price on application, and early orders are respectfully solicited.
York Nurseries, Dec. 30.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s*. per doz.; HOWARD'S PRINCE ALBERT, 12*s*. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford, Dec. 30.

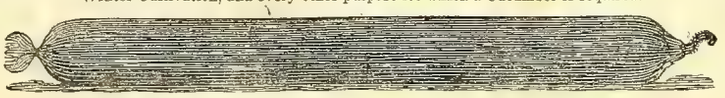
FLEMING'S HYBRID CASHMERE MELON.—The above new Melon was raised by Mr. Fleming at Trentham, and exhibited by him for the first time at the Great Meeting of the Horticultural Society of London at Chiswick on the 10th June last against a multitude of competitors, when it was awarded the first prize, and pronounced by the judges to be very far superior to all others produced, and decidedly the best Melon known. The entire stock is in the hands of the undersigned. Packets of Six Seeds, 2*s*. 6*d*.; of 15 do., 5*s*.
R. GLENDINNING, Chiswick Nursery, London.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4*s*. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s*. per dozen.
ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s*. per dozen. List of names forwarded upon application.
A remittance or reference to accompany all orders from unknown correspondents.
Paradise Nursery, Hornsey Road, Islington.

TWO NEW CUCUMBERS.

SIR COLIN CAMPBELL AND GENERAL CANROBERT.

THE ABOVE are two of the Finest and most Superb New Hybrid Cucumbers ever yet sent out for Exhibition, Winter Cultivation, and every other purpose for which a Cucumber is required.



SIR COLIN CAMPBELL CUCUMBER.

The above Cut is an exact representation of one of the fruit grown this summer, which measured exactly ten of its diameter long, being 25 inches, with not more than half an inch handle. It is a splendid Black Spine, of a dark green colour, and free from ribs or shrivels; grows very quick, sets free, and carries its bloom well. As a Cucumber for Exhibition nothing can surpass it, and is very prolific, often throwing out four or five fruit from every joint, and the vines are short jointed. The fruit is solid, and eats very crisp, and for market it keeps its bloom well for many days, not turning colour at the stem or point as most varieties do. Fruit was cut from the above in January last, and the same plants continued to produce fine fruit until the end of October.

GENERAL CANROBERT CUCUMBER.

This is also a most superb variety for winter cultivation, for which it is best adapted, being a hybrid from Lord Kenyon's Favourite and Phenomena. It has a great advantage over Kenyon's in length, growing to about 18 inches in the same time in which Kenyon's will grow 12 inches; it is equally as hardy and productive. Of a dark green appearance, Black Spine, and a free setter; fruits freely during the whole of the winter, and always grows a very even size from stem to point. It will swell off two or three fruit at a time on a plant, during the depth of winter, and carry them out well, which it does with less heat than any other: this has been proved when several varieties have been grown together, this having the coldest part of the house. The object of the raiser of the above superb varieties has been to obtain perfection and hardiness, in which he has succeeded, by continually hybridising different varieties.

Sold in Packets of Five Seeds, 3*s*. 6*d*. each, or 1 Packet of Sir Colin Campbell and General Canrobert for 6*s*.

The following fine varieties of Cucumbers and Melons, which have been thoroughly proved and have given the greatest satisfaction to all Purchasers, can be supplied.

CUCUMBERS.

Captivation	2*s*. 6*d*.	Hunter's Prolific ...	1*s*. 0*d*.
Phenomena	2 6	Mills' Jewess	1 0
Lord Kenyon's	2 6	Cheltenham Surprise ...	1 0
Essex Hero	2 0	Manchester Prize ...	1 0
Victory of Bath	1 0	Sion House True ...	1 0
Gordon's White Spine'...	1 0	Cuthill's Black Spine ...	1 0
Sunderland Wick ...	1 0	Conqueror of the West...	1 0

MELONS.

The Queen	1*s*. 0*d*.	Beechwood	1*s*. 0*d*.
Bromham Hall ...	1 0	Windsor Prize	1 0
Incomparable ...	1 0	Emperor	1 0
Golden Ball	1 0	Fleming's Hybd. Persian	1 0
Bowood	1 0	Blackall's Green Flesh	1 0
Victory of Bath...	1 0	Bailey's "	1 0
Camerton Court ...	1 0	Snow's Hybrid	1 0

A Packet of either of the Melons will be given to all Purchasers of the two new Cucumbers advertised above.

A Remittance must accompany every Order by Cash or Penny Postage Stamps, and the whole, or any part (as the case may be), will be immediately forwarded.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, and FLORIST,
14, Abbey Church Yard, Bath, Somersetshire.

The New Chinese Potato, Dioscorea (Japonica) Batatas.

MR. JOHN HENDERSON,

Formerly of the Firm of JOHN A. HENDERSON & Co., Pine Apple Place, London,

HAS the pleasure of informing the Public that he has just completed the Purchase from M. PAILLET, of Paris, of his entire Saleable STOCK of the above introduction from China, the nutritive properties of which are said so far to surpass the ordinary Potato that it is likely, not only to act as an auxiliary, but entirely to SUPERSEDE that valuable but uncertain esculent.

The most satisfactory results have followed from personal experiments, and proved that when cooked in the ordinary manner, from the large amount of FARINACEOUS properties it contains, it can NEVER become waxy, as is too generally the case with the Potato. Its FLAVOUR resembles in delicacy an early ASH-LEAVED KIDNEY; but, independent of the above excellent qualities, there is every probability of its taking a still more important position in the ECONOMY of this country, for, when dried and reduced to powder, it is equal to the best ARROW-ROOT; or mixed in the proportion of one-third with two-thirds of wheaten flour, it makes an extremely light and wholesome BREAD, as well as very superior PASTRY.

MESSRS. VILMORIN & Co., speaking of it, observe:—"Of all the esculent roots proposed as substitutes for the diseased Potato, the DIOSCOREA JAPONICA is certainly the only important one. It is easily propagated. The tubers are large and long, the flesh very mealy and devoid of any peculiar or disagreeable flavour. The DIOSCOREA JAPONICA is, in our opinion, a PRECIOUS ACQUISITION."

M. PELÉ, Horticulturist, Paris, in his Supplementary Catalogue of this autumn says:—"A new alimentary root, introduced into France by M. MONTIGNY, French Consul in China. Serious experiments have shown that this tuber will be much more advantageous to cultivate than the Potato, both in regard to its QUALITY as well as PRODUCE."

M. PAILLET, to whom the Imperial Society of Agriculture and Commerce of France has awarded the sum of 3000 francs as encouragement for having brought it into cultivation, also notices that "this tuber attains at least 1 to 2 lbs. weight. In its growth it is less delicate than the Potato, which unfortunately has of late years much degenerated. It does not require particular care, and its abundant produce amply repays cultivation. Its taste is pleasant, and being a root which contains a large amount of FARINA, will be a great addition to the FOOD OF THE PEOPLE as soon as it becomes generally known. It is so HARDY that it has passed the winters of 1853–4 in the open ground, without having in the least suffered from frost. It is also found that the STEMS and LEAVES, which are very numerous, form an EXCELLENT FOOD FOR CATTLE."

Tubers, with description of the Chinese Mode of Culture, to be obtained of MR. JOHN HENDERSON, KINGSKERSWELL, SOUTH DEVON, at the following prices, for cash only:—

4 Tubers ... ... £0 10 0 | 10 do. ... ... £1 2 6 | 50 do. ... ... £5 5 0 | 100 do. £10 0 0

Post-office orders are requested to be made payable at Newton Abbot, South Devon. The usual discount allowed to the trade when not less than 50 are taken.—P.S. All orders unaccompanied by a remittance will be considered as not received.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by MR. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regent's Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by MR. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope MR. JACKSON'S process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,

"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

NEW PEA.

W. J. EPPS, SEED MERCHANT and GROWER, Maidstone, has much pleasure in offering the following Pea, feeling assured it will give the highest satisfaction.

LORD RAGLAN, OR IMPROVED MAMMOTH.

This Pea was selected from Hair's dwarf Mammoth two years since, and is unquestionably the best and finest in cultivation, and will prove to be the standard Pea of the day. It is a dwarf green wrinkled marrow of very large size, and an immense cropper. Habit dwarf, branching 3 to 4 feet high, producing immense clusters of large bright green pods from the base of the haulm to the top, and similar in shape to the Scimitar, but of greater size, well filled with seven to ten Peas, which are larger than the British Queen, and equal, if not superior in its flavour.

Price, 5*s*. per Quart. Wholesale Prices to be had on application.

Agent: Messrs. HURST and M'MULLEN, Seed Merchants, Leadenhall Street, London.

NEW SORTS OF PEAS.

CARRIAGE FREE, EXCEPT PARCELS UNDER 10*s*. VALUE.

SUTTON AND SONS *have much confidence in recommending the undermentioned* PEAS, *as being not only new and distinct from others, but also as possessing superior properties.*

Prices per peck or bushel may be had on application.

	s.	*d*.
PRIZETAKER.—New, fine long green pods, which hang so closely as almost to cover the haulm from top to bottom. Numerous prizes were awarded to the Prizetaker last summer. This is the first season we have offered it for sale. Height 5 feet	2	6
BECK'S EARLY GEM.—New, prolific, and fine flavour; particularly adapted for narrow borders and for small gardens. Height 1½ foot	1	6
BECK'S ECLIPSE.—Similar to Scimetar, but earlier and more dwarf. Height 2 feet	1	6
SUTTON'S EARLY CHAMPION.—One of the forwardest sorts known, good flavoured, and prolific. This Pea is worth a much higher price, but having grown a large crop, we are enabled to offer it very moderate; 3 feet	1	0
WAITE'S DANIEL O'ROURKE.—A very popular variety, considered by some to be the forwardest Pea yet out. It should be tried against our Early Champion; 3 ft. high	2	0
FAIRHEAD'S EARLY CONQUEROR.—Height 3 feet	1	0
PAUL'S EARLY DWARF.—One of the most prolific early Peas, forming a complete mass of blossoms and pods. Height 2 feet	2	0
FAIRBEARD'S NONPAREIL.—New wrinkled marrowfat, very sweet, juicy, and prolific; 9 or 10 will be found in every pod, and the pods extremely numerous; 4 ft. high	2	0
WAITE'S KING OF MARROWS.—As large as British Queen, with fine green pods, very long and full; 6 ft. high	2	0
HAIRS' DEFIANCE.—Like Knight's tall, but earlier and not so tall; 5 feet high	1	6
HAMILTON'S NOVEMBER PROLIFIC.—Excellent for all seasons; 3 feet high	1	6
NE PLUS ULTRA.—One of the finest green wrinkled; 6 ft.	1	6

SUTTON & SONS have a large stock of good old kinds at low prices, as see their Priced List, just published, price 6*d*., or gratis to purchasers.

SUTTON & SONS, Seed Growers, Reading.

DICKSON'S EARLY FAVOURITE PEA.

FRANCIS AND ARTHUR DICKSON AND SONS, SEED MERCHANTS, &c. Chester, have much satisfaction in introducing the above NEW Pea, which they believe they are perfectly justified in saying is the BEST and MOST PROLIFIC EARLY PEA in cultivation.

It has been tried side by side with all the best early and second early Peas of the day, and has been pronounced by many eminent gardeners who saw it under these circumstances to be much superior to any variety of its season hitherto introduced.

It comes in about a week later than the Early Emperor (sown at same time), grows about 4 feet high, and produces a wonderful profusion of pods, which contain on an average TEN PEAS of EXCELLENT QUALITY and FLAVOUR. It has been grown the last two seasons in the Gardens of the Horticultural Society, and Mr. Thompson, in reporting upon it, writes as follows:—

"Horticultural Society's Gardens, Dec. 20th, 1853.

"In reply to your inquiry respecting DICKSON'S EARLY FAVOURITE PEA, I beg to state that I consider it a *new* and *very desirable* variety. It is very prolific in pods, and also as regards the number of Peas in the pods, and the quality is excellent. It most resembles the Auvergne, but is earlier than that excellent sort, and the pod is not so much hooked. "R. THOMPSON."

"Horticultural Society's Gardens, June 28th, 1854.

"I beg to hand you a copy of the memorandum which I made respecting your Early Favourite Pea, amongst others, again this season. About 4 feet high, very prolific; pods long, roundish, slightly curved, containing on an average nine to ten Peas of excellent quality. Bears some resemblance to the Auvergne, but differs in having straighter pods, and it is much earlier than the Auvergne. *An excellent prolific Early Pea.*

"R. THOMPSON."

Price 3*s*. 6*d*. per quart; per pint, 2*s*.

Messrs. HURST & M'MULLEN, Seedsmen, &c., 6, Leadenhall Street, London Agents.

N.B. The trade supplied on liberal terms.

106, Eastgate Street, Chester, and 14, Corporation Street, Manchester.—December 30.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d*. stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

GREAT NOVELTIES FOR THE ENSUING SEASON,

FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

GALANTHIFLORA-PLENA

(The DOUBLE Snowdrop Corolla'd Fuchsia.)

Pure double white corolla, resembling a fine large double snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10*s.* 6*d.* each.

The usual discount to the Trade when three or more are taken.

Exeter Nursery, Exeter.—ESTABLISHED 1720.

GENUINE GARDEN SEEDS.

LUCOMBE, PINCE, AND CO., beg leave to announce that they have just completed their supply of the above, all carefully selected from the stocks of the best growers, superior in quality and economical in price, to which they respectfully call the attention of those who require a really genuine article. Their long experience in the Seed Trade (always also proving the vitality of their seeds before sending them out) fully justifies them in saying that their seeds cannot fail to give great satisfaction.—Catalogues may be had on application.

Exeter Nursery, Exeter. Established in 1720.

NOW READY.

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready, and should be ordered forthwith, by which a full supply of every kind of Vegetable Seed required during the whole year will be secured (including the best sorts yet introduced), and at a very small cost, viz.:—*

No. 1 Collection	...	£3	0	0	No. 3 Collection ...	£1	5	0
No. 2 do.	...	2	0	0	No. 4 do. ...	0	15	0

The quantities in each collection being apportioned to the size of the garden, INSTRUCTIONS ON CULTIVATION will be enclosed with Nos. 1, 2, and 3. To secure the best sorts, orders should be given immediately, addressed

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

RENDLE'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready. They can be had to suit various sized Gardens at the following prices:—*

No. 1 COLLECTION	...	...	...	...	£3 0 0
„ 2	„	...	...	...	2 0 0
„ 3	„	...	...	...	1 5 0
„ 4	„	...	...	...	0 15 0

The quantities are fully detailed in their "Price Current and Garden Directory," a new edition of which is just published.

WILLIAM E. RENDLE & CO., Seed Growers, Plymouth.

ESTABLISHED 68 YEARS.

BASS AND BROWN'S NEW AUTUMN CATALOGUE, supplied free for three Penny Stamps. They have this season a very fine and vigorous stock of the finest Roses, among which are a number of very superb new Continental varieties, consisting chiefly of the perpetual class. The following selections will be highly approved,

ROSES.

100 Standards in 100 very superior varieties	...	...	£7	10	0
100 „ 50 „ „	...	...	6	10	0
50 „ 50 varieties ditto, all selected from perpetuals	...	...	4	0	0
100 dwarfs and half standards, or all dwarfs, in 100 very superior varieties	...	...	4	0	0
100 ditto in 50 varieties, ditto	...	...	3	0	0
50 ditto in 50 varieties, ditto, all from perpetuals	...	...	2	10	0
Fine mixed dwarfs, per 100	...	...	1	10	0

Hardy Herbaceous Plants, Hollyhocks, prize-named Gooseberries, Strawberries, Standard Dwarf and Trained Fruit Trees, Flower Roots, and a variety of desirable articles offered in selection for present planting, for which see *Gardeners' Chronicle*, Oct. 14, page 659, and Oct. 28th, page 690.—Goods, carriage free (not under 20*s.*), to all the London termini, and all Stations on the London and Norwich Colchester Line. Plants added gratis with orders of 40*s.* and upwards.

Seed and Horticultural Establishment, Sudbury, Suffolk.

CHARLWOOD AND CUMMINS have to offer SEEDS of the LILIUM GIGANTEUM in packets of 100 Seeds, at 20*s.*, free by post. Also Acorns of the following varieties of American Oaks:—

Quercus alba		
„ Banisteri		
„ obtusiloba	per quart	2*s.* 6*d.*
„ nigra		
One-year's Seedling Plants of each ...	per 100 seeds	3*s.* 0*d.*
Abies pinsapo	ditto	8 0*d.*

They will also have in time for this Season's sowing Seed of the Osage Orange, at 4*s.* per lb., for which early orders are solicited. Their Catalogue of Agricultural, Garden, and Flower Seeds are ready, and will be sent free on application.

14, Tavistock Row, Covent Garden.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. Packets of seed, consisting of 20 varieties, selected from the best show flowers, 5*s.*; 12 varieties, 2*s.* 6*d.*; and from good double sorts, 1*s.*

Very superior Quilled German Asters, 12 distinct varieties, separate, 2*s.*, mixed 1*s.* per packet. Also Choice French Asters, 12 varieties, separate, 3*s.*, mixed, 1*s.* 6*d.* Fine Quilled African Marigolds, lemon and orange, 6*d.* per packet.

New Double Crimson ROCKET, excellent bedding plant for spring flowering, 6*s.* per dozen, or 2*l.* per 100. Double French White, 4*s.* per dozen, or 30*s.* per 100.

Saffron Walden Nursery, Dec. 30.

GARAWAY, MAYES, AND CO. having succeeded in saving some fine SEEDS of that truly magnificent Lily, LILIUM GIGANTEUM, which are now well matured, they offer fine picked Seed at 25*s.* per 100. Fine, new, long prolific Cucumber Ne Plus Ultra, Victory of Bath, do. Syon House, Lord Kenyon's Favourite, Roman Emperor, Berkshire Champion, Manchester Hero, Pollington's Black Spine, Pollington's Early Prolific. Victory of Bath Melon, Bromham Hall, Camerton Court Green-flesh, Beechwood, with all other most approved kinds in cultivation, 1*s.*, 1*s.* 6*d.*, to 2*s.* 6*d.* per packet.

Durdham Down Nursery, Bristol, Dec. 30.

PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

J. AND J. FRASER have to offer a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application.

In offering these Pears, grafted on the Quince stock, we would wish particularly to call attention to their many excellent qualities. They are very compact in growth, and most prolific in bearing, fruiting profusely while the trees are small; thus forming a great acquisition for a small garden. Planted by the side of walks, in addition to their utility, they add much to the neatness and beauty of a kitchen garden. Indeed too much can scarcely be said in favour of these miniature Pear trees; as a proof of their merit the demand for them is yearly increasing.

Strong Trees, showing Fruit Buds, 2*s.* 6*d.* to 3*s.* 6*d.* each.

Lea Bridge Road, Essex, December 30.

GODFREY'S BLACK SPINE.

SPLENDID AND PROLIFIC FRAME CUCUMBER.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom; average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2*s.* 6*d.*; 6 ditto, 1*s.* 6*d.*

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. HURST & M'MULLEN, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1*s.* each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, Dec. 30.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 30, 1854.

THIS being the last number of the *Gardeners' Chronicle* for the present year, it seems desirable that the public should be made acquainted with the course which affairs have taken in the WOODS AND FORESTS since we last noticed them. It will be remembered that on the 1st of May Mr. KENNEDY was dismissed from his office of Commissioner, and that Mr. GORE was charged with the duties of the right honourable gentleman until a successor could be found. Eight months have since elapsed and no successor has been nominated; not that the Treasury has been altogether idle, but because its industry has been abortive.

Finding that the removal of Mr. KENNEDY met with no approbation except from a few gentlemen connected with Government, and not with all even of them, and seeing moreover that the public dissatisfaction was likely to find expression in a way by no means agreeable to the parties concerned, it was thought desirable to coax some of the opponents of the Treasury into acquiescence in what had happened; and the notable plan was hit upon of offering Colonel ROMILLY, *Mr. Kennedy's brother-in-law*, the office from which his sister's husband had been dismissed! What reply this very decent proposal received may be easily imagined. The scheme having failed, Lord COURTENAY appears to have been asked to accept the vacant office, quitting the Poor Law Board, where he received 1500*l.* a year, for the commissionership of Woods and Forests, with a salary of 1200*l.* a year. The consideration which the noble lord was to have received for the surrender of 300*l.* a year will, we suppose, be known in due time. One thing, however, is notorious, namely, that he was to have been succeeded at the Poor Law Board by Mr. HAYWARD, Q.C., a friend, we believe, of the Duke of NEWCASTLE. Unluckily for the Treasury, this agreeable arrangement caused such an outcry both "in Parliament and out of Parliament," that the advisers of Government shrank back aghast—the appointments, though announced, were abandoned—and the office held by Mr. KENNEDY still remains open. Finally Sir JOHN SHELLEY has given notice that he will move, immediately after the recess, for a committee to inquire into the circumstances attending the dismissal of the late commissioner. In the meanwhile the autumn has passed, and her Majesty's Woods and Forests still remain without the control of a chief officer responsible to Parliament.

The *Civil Service Gazette* hints, indeed, that Mr. GEORGE ARBUTHNOT is to be rewarded with this office, the transfer of Lord COURTENAY not having been found practicable. Of Mr. ARBUTHNOT we know little, except that before Mr. DRUMMOND'S committee he gave some evidence, which we would not call discreditable if we could find a better epithet for it. Our contemporary, however, which seems to understand him, speaks of him in the following terms—"We warn the Treasury, and particularly Mr. GLADSTONE, who so emphatically and solemnly declared that the Commissionership of Forests 'was a place of too much importance to be hastily bestowed, and that the Government were in search of a duly qualified person to fill it,' that an antiquated Treasury obstructive is not the man, after all the trouble the Department of Woods and Forests has cost the House of Commons, to place in so important a post. As a Treasury Clerk, Mr. ARBUTHNOT knows nothing of that department. He is ignorant upon every subject, except what relates to the jobbery of its patronage for several years back, than which there could not be a greater disqualification for one who would undertake a task for which, Mr. DRUMMOND says, 'less than Mr. KENNEDY'S virtue and intelligence will not suffice.' Not only as to the 'Woods and Forests' has Mr. GEORGE ARBUTHNOT obtained the unenviable distinction of opposing all change and reform, but, if he had had his way, no such men as a TREVELYAN and an ANDERSON, at the Treasury, or a BROMLEY, at the Admiralty, would have been allowed so prominently to serve their country; whilst as long as he remains at the Treasury, reform in the Civil Service seems destined, through his influence, to keep pace with his tardy perceptions of its necessity."

Among the deputy-surveyors we hear of changes, but of nothing certain. It is reported that Sir JAMES CAMPBELL, a protégé of the Duke of NEWCASTLE'S, is promoted from Bere and Parkhurst to the Forest of Dean, that Mr. HIGINBOTHAM has taken charge of Bere and Parkhurst, and that Mr. LIPSCOMBE still enjoys the Forest of Delamere. We cannot, however, authenticate these statements; they are only given upon what we believe to be good authority. Should it be true that Sir JAMES CAMPBELL is in charge of Dean Forest, his presence would not seem to be much respected there, for, according to the newspapers, robbery on an enormous scale is renewed in that lawless district, for the complete subjugation of which the friends of Mr. MACHEN, the late deputy-surveyor, have insisted that he deserved the greatest credit, if for nothing else.

A NOVELTY has this year appeared in the form of a tall, reedy grass, called HOLCUS SACCHARATUS, of whose economical value we find that great expectations are entertained. What has more especially brought it into notice is the recent French law prohibiting the distillation of spirit from grain. A specimen was exhibited before the Horticultural Society some weeks since by Mr. INGRAM, who had raised it in the Royal Garden at Frogmore; but so little had at that time been heard of it that it attracted small attention. Now, however, that our neighbours are actively engaged in experimenting on its qualities, it is as well that what has been published concerning it should be made known; and we, therefore, give the following translation of a paper on the subject by the distinguished French horticulturist, M. LOUIS VILMORIN.

"An incorrect account of the Holcus saccharatus which I presented to the Central Society of Agriculture, at its sitting of the 18th of January, having appeared in the *Moniteur Universel* of the 20th of January, 1854, and having thus prematurely drawn attention to this plant, attributing to it, by an error of figures, qualities which, if they had been real, would easily have justified the rapidity with which the article was copied into many of the journals, in order to prevent the further propagation of these false notions, I am now obliged to return to the notice of this plant, to which I should not otherwise have reverted till I had more completely studied it.

"The plant in question, which I presented to the Agricultural Society in the name of one of its correspondents, M. RANTONNET, of Hyères, is called *Holcus saccharatus*. It has long been known, and was even cultivated in Italy in the beginning of the present century; but whether owing to the methods of extraction known at that time being not sufficiently good to be used with advantage, or that the variety was not so rich in saccharine products as that which we now possess, its cultivation was abandoned.

"Four years ago, M. DE MONTIGNY, the French Consul at Shanghae, sent to the Geographical Society a collection of seeds, among which was found labelled "Sugar Cane of the north of China." The seeds were liberally distributed by the Geographical Society, and this year I had in cultivation a small lot which I had received from one of my correspondents in Champagne, M. PONSARD, of Omey. The plant is the same, botanically, as the *Holcus saccharatus* formerly cultivated by L. ARDUINO, and the letter of M. RANTONNET, by which I was intrusted to present it in his name to the Agricultural Society, has enabled me to trace the source of this new introduction to the collection of seeds forwarded by M. DE MONTIGNY. The way in which the plants were obtained being thus regularly established, I may now state the nature of the carefully conducted experiments to which they were subjected.

"One stem, weighing 6944 grains, gave on the first trial, made October 13th, 231½ grains of limpid juice with no other flavour than that of sugar and water. The juice obtained from the whole stem yielded 10.8 per cent. of its weight of sugar.

"Another trial, made with the saccharometer, Nov. 28th, gave results varying from 14.6 to 13.8 per cent. of sugar; I have ascertained that the proportion of sugar decreases in the successive internodes or joints, from the base upwards, those at the base and middle being the most sugary.

"I have only had in cultivation some square yards of our *Sorghum* (Holcus saccharatus), in rather poor garden soil, and in the vicinity of trees unfavourable for it. In that situation, however, there were about 20 stems per square mètre, or more than 17 per

square yard, and of sufficient weight for the extraction of juice; this would be at the rate of 3 kilogrammes of juice per square mètre, or 30,000 per hectare, or 27,180 lbs. per acre; and, estimating the quantity of sugar at 10 per cent. of the juice, the produce per acre would be 2718 lbs. of sugar, which is much more than the average produce of Beet-root.

"According to these corrected figures, there is a probability that the plant in question may prove worth cultivation; but several years' trial will doubtless be necessary before we can ascertain whether it will really answer in a commercial point of view.

"The plant bears much analogy to the Maize, and is similarly cultivated; that is to say, by sowing in rows or in patches, in the open ground, from the middle of April to the end of May."

Such was the information existing in France in the beginning of the present year; since which we have seen no authentic report of further experiments; for an announcement in the *Gazette de France*, and copied into other journals, that this "Chinese Sugar Cane" produces 30,000 kilos an acre *more than Beet* is undeserving notice. We understand, however, that the plant is attracting great attention among the Continental distillers in consequence of its richness in sugar, and the extraordinary purity of its juice.

Whether it will be of value in this country depends upon three circumstances as yet unascertained; 1, Whether our climate is warm enough for it; 2, Whether the Excise-laws will permit its use for distillation; and 3, Whether its refuse can be utilised. Upon all these points we must wait for further explanation; it will, however, be easy to determine them next year, for we understand that a certain quantity of the seed is likely to come into our market in a week or two.

A few weeks ago we ventured to express an unfavourable opinion of a gigantic plan for utilising the sewage of London, to which plan our excellent friend Mr. Mechi afterwards announced his adhesion. The objection that we took to that plan in particular, and which we have always taken to all similar schemes, as concerns the metropolis, was that they will not pay. We have never denied the value of liquid sewage; we have only expressed the opinion that more money must be expended in obtaining it than the article is worth. It is only solid metropolitan sewage that we have wholly condemned.

Our course has not been taken without a full knowledge that we are obliged to disagree with many gentlemen for whom we have the greatest possible respect, and to pull down the paper castles of many an ingenious speculator. We have hitherto, however, only expressed our individual opinion; there was nothing positive to which we could appeal. A late number of the "Journal of the Society of Arts" has, fortunately, brought to our support no less an argument than one derived from practical experience gained at Manchester. Mr. Thompson, Secretary to the "Manchester Sewage Guano Company," makes the following statement:—"We several years ago incurred considerable expense in testing the value of liquid sewage by the erection of suitable charcoal filters, and the precipitation by lime water and other means of the solid matters of the sewage; and succeeded in arresting all the feculent and organic matter, except that which was in a perfect state of solution. The sewage operated upon was of the best description, and had been reported, according to chemical analysis, to contain an unusual amount of highly fertilising ingredients. The result obtained, after long and expensive trials, was the perfect filtration of the water, so that, after it had passed the filter it was clear and transparent, thus effectually obtaining one of the objects in view; but the other equally important point, viz, the securing of the agricultural value of the sewage matter, *was very unsatisfactory*, as the most valuable chemical salts, &c., passed off through the filter in a state of solution with the clear water. Various chemical expedients were adopted to arrest them, but the expense of doing so, in consequence of the bulk of water to be treated, was found to be *much greater than their agricultural value*. The sewage manure made by the process of simple filtration was only worth 25*s*. per ton, or little more than the value of the charcoal, and consequently during the years of 1850 to 1852 we sold at considerable loss all the manure so manufactured at that price."

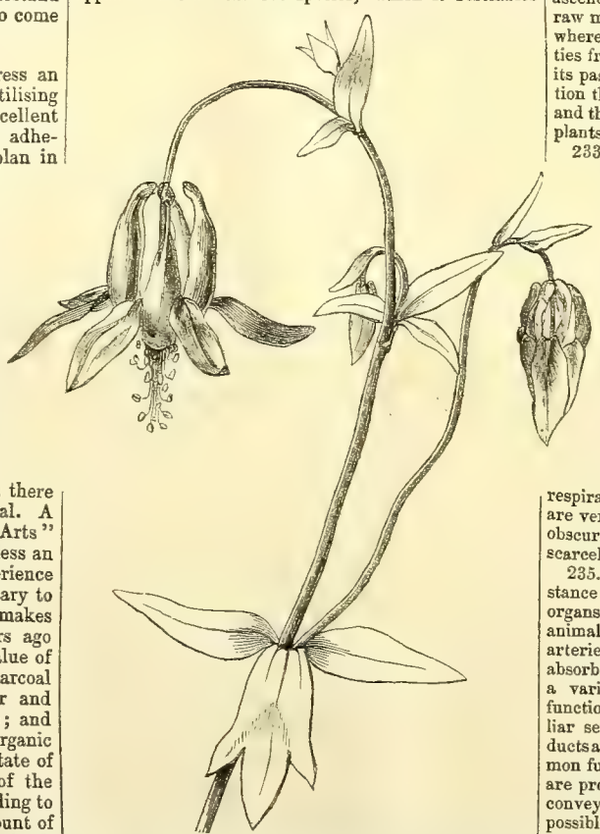
And again, "I can fully bear out the assertion of another of your correspondents, 'that all that has yet been done in manufacturing a concentrated manure from the liquid sewage of towns has failed, or resulted in the spending of a *shilling* in labour and chemical materials, to produce an article worth *tenpence*,' and, as the experience of this company may possibly be found useful in some measure to Local Boards of Health or other parties following in the same direction, and as there is a wide field open for similar undertakings, I have been authorised to communicate to you the result of our operations."

Here then we have no longer the mere opinion of ourselves or anybody else to rely upon, but the practical experience of men who have attempted with skill to make the liquid sewage of a large town pay, and who have wholly failed. It is true that Mr. Brooks has boldly come to the rescue of liquid sewage speculation, and offered 1000*l*. to the person who shall make its removal for agricultural purposes pay, but we know nothing of the issue of this last attempt, and can hardly expect it to have more success than its predecessors. Therefore, until the weight of evidence now before us is overbalanced by what does not as yet exist, we must adhere to our opinion that instead of asking market gardeners to pay towns for the article in question great towns must be content to pay cultivators to take it away, or at least deliver it to them without any such charge as the cost of delivery incurs. Should the metropolis be able to remove its sewage at the cost to itself of a million a year, and to vend it to the suburbs for half a million, it ought to be perfectly contented, and willing to pay the other half million out of the rates.

New Plants.

107. Aquilegia californica. *Hartweg.*

A plant from California distributed by the Horticultural Society under Hartweg's name of *A. californica*, proves upon careful examination to be a mere form of *A. canadensis*. The flowers are rather brighter, with more yellow in them, so that it produces a showier appearance than the old species, which it resembles



in all its habit; but there is nothing to justify its being considered more than a good garden variety, as will be obvious from the accompanying sketch of a small piece of the inflorescence.

VEGETABLE PATHOLOGY.—No. LII.

231. Classification of Disease.—In proposing the plan of this treatise on the diseases of plants, it was considered that the most simple mode of classification would be to divide them into two ground classes, comprising those which arise respectively from internal or external causes; or, in other words, which are properly constitutional or merely accidental. External causes may indeed, in some cases, produce the same effects as mere weakness of constitution, but still the consequent diseases may have essential marks of distinction, and may in reality be only very remotely allied. In either case the functions of the plants may be affected, or there may be an organic change, and hence we have two distinct heads of sub-division, according as the disease is functional or organic.

232. As far as is at present known, the functions of vegetables are far less numerous than in the animal kingdom. There is, for instance, nothing like a general system of circulation, proceeding from a common centre. In some cases there is indeed a sort of circulation of the juices in individual cells, as in the hairs of the stamens of Tradescantia, the cells of Chara, and some other Cryptogams; while in many Phœnogams and some Fungi a system of vessels, containing a milky juice of various colours, as in Chelidonium, Lactarius, &c., runs through the plant, and a sort of circulation has in some cases been supposed to exist. The matter, however, rests at present on uncertain facts, or wrong explanations of evident phenomena, and is, after all, very different from the circulation of the blood in animals. The object of such circulation is twofold, viz., to supply nutriment to every part of the organism, and to restore the waste of oxygen incurred by exposing as large a surface as possible to communication with the atmospheric air in the lungs or Branchiæ. Now in the processes of vegetable chemistry, oxygen is constantly eliminated, and in consequence it is given out from those channels which communicate with the external air, but more especially under the influence of light, inasmuch as many of those processes are favoured by the action of light, and some cannot be perfectly accomplished in its absence. There is then a constant interchange of juices from cell to cell, and a general upward current induced mainly by evaporation, and as these juices are exposed to the influence of light, more especially in the leaves, and to the atmospheric air through the stomates, the sap previous to its descent—which is regulated partly by gravity, partly by the laws of endosmose—and exosmose, becomes more highly elaborated, and therefore, on the whole, though with many exceptions due to the lateral as well as vertical motion of the sap, we have an ascending current of weak juices, and a descending current of more highly elaborated sap; but it would evidently be incorrect to consider these analogous to venous and arterial blood, because it cannot be said that the ascending current has lost its vital properties, inasmuch as it never attains its perfect attributes till it has passed through the leaves, where it parts with a portion of its water and enters into new combinations. The ascending current is in fact rather to be compared with raw matter taken up into the stomach, though it may, where the attracting power is small, acquire new properties from interchange with matter already stored up in its passage to the leaves, and it is only by way of illustration that the roots of a plant can be called the stomach and the leaves the lungs, because there are no functions in plants strictly correlative with digestion and respiration.

233. Again, there is no system of nerves in plants. The phenomena of nervous energy, galvanism, electricity, chemistry, magnetism, &c., are so marvellously connected with each other, that it is probable that they are all mere modifications of one common unknown power, and therefore, though there are no visible nerves, much less any common nervous centre, there may be notwithstanding certain isolated phenomena, as for example those of the sensitive plant, which simulate the effects of nervous energy; and there is the greater probability that they are really due to some common agent, since certain chemical matters, such as chloroform, prussic acid, &c., produce analogous results to those which they produce in animals. Irritability is clearly due to something more than mere mechanical force.

234. In three great points, therefore, circulation, respiration, and nervous energy, our limits of inquiry are very narrow, and as the functions themselves are obscure the derangements of those functions can scarcely be appreciated with any great degree of nicety.

235. But further difficulty arises from the circumstance that the several functions carried on by the organs of plants are by no means so isolated as in the animal kingdom. We have no distinct set of veins and arteries and nerves; neither have we of lacteals, absorbents, and excretory vessels; but though there are a variety of modifications of cellular tissue, various functions, except possibly in those cells which contain peculiar secretions, are carried on in common by all. The ducts and vessels in an early stage participate in these common functions, and when arrived at their ultimate form, are probably capable of nothing more than containing or conveying air, without much vital action. It is scarcely possible, then, in plants as in animals to divide diseases accurately into such as affect the respiration, circulation, digestion, nervous system, &c.; but we must be content with mere approximations to these phenomena, while we may hope for more accuracy when we speak of absorption of nutritive fluids, evaporation, assimilation, and other points which admit more readily of estimation. *M. J. B.*

PEAR TREE CULTURE.

The firmness of the English character is now pretty well established; at Waterloo Napoleon said, "Those English don't know when they are beaten:" for "beaten" in my case read convinced. M. de Jonghe has written to a great extent about his system of pruning enabling the blossoms of fruit trees to resist frost (Why is it that a cankered branch, or one that has been partially broken or injured, and crowded with blossom-buds, will often bear a full crop when all the vigorous healthy blossoms are killed by frost?), and yet I am as fully convinced as ever that he is entirely wrong in this, and also in his estimate of our climate, which he does not know. He reminds me in this matter of a naval friend who was for some years in St. Helena. At a horticultural show held there a few years since, English and Chinese gardeners competed for the prizes; in Cabbages one of the latter, a very clever gardener, had the best; but the judge in that department (my friend), whose knowledge of Cabbages was not very

deep, and from a little national feeling, gave the prize to the Englishman. At this John Chinaman was very indignant; but as he had a great respect for my friend, he vented it in the following good-natured way: "Misser Gulliver him very good man, but him no savvey Cabbage," which means Mr. G. is a very good man, but he don't know Cabbage; for Mr. G. read M. de Jonghe, and for Cabbage read climate. You lately gave the mean temperature of Brussels as 3° higher than that of London; the temperature of August and September, when fruit trees are ripening their fruit and their fruit-buds, is at least 6° higher than that of London. And any visitor to Brussels, towards the end of July, must be struck with the bushels of Breda Apricots hawked about the streets, gathered from standards, when such articles grown in England are not to be seen in London; thus showing the superiority of the climate over that of London.

I have only recently recollected some peculiar cases of the influence of climate on culture, which pray allow me to register in your columns. In one of my Judge orchard-houses I have a pyramidal tree on the Quince of the Duchesse d'Angoulême Pear, planted in the border and pruned carefully; about 20 yards from this I have another pet tree of the same sort, a pyramid, on the Quince planted on my lawn, and pruned with equal care;—the frost last April destroyed every fruit on my lawn tree, but on the tree under glass I had an abundant crop. At Chelmsford, about 15 miles from here, direct south east, in the nursery of Mr. Saltmarsh, trees of Marie Louise Pear were this season full of fine fruit, an abundant crop, and those of Beurré Capiaumont were ready to break down, so heavily were they laden; those trees are all standards, and entirely unpruned, except the usual thinning out of crowded branches. Now, in the first instance I have named, my lawn tree ought to have withstood the frost, as it was under the best culture, and the trees of Mr. Saltmarsh ought not to have borne any fruit, because the blossom buds had not been thinned out and the trees systematically pruned. But, mark the influence of climate; my tree under glass gave me a full crop, and the trees at Chelmsford, growing in a sheltered situation, in a warm soil, did the same. I may also remark that trees trained to the walls in the gardens of the Horticultural Society at Chiswick, although pruned and managed in the best possible manner, have not been able, for several seasons, to withstand the effects of our spring frosts; therefore, although pruning and attending perfectly to fruit trees is of first-rate importance, it is almost ridiculous in M. de Jonghe to affirm and re-affirm that pruning will enable fruit trees to resist the effects of an adverse season; in like manner, his advocacy of growing dessert Pears on standards, with stems 6 to 7 feet in height, is inadmissible: for in our climate, the "Channel winds," as they are called, blow over the whole surface of our island. At Brussels they are not known; and I have often felt surprised to see the fruit on those tall, but not very ornamental trees for gardens, hanging unscathed by equinoctial gales at the end of September. Depend upon it, we cannot keep our choice fruit trees in England too near mother earth; for in most of our gardens large dessert Pears on tall standards would be dashed to pieces by our autumnal gales. Let me here state that I have "no motive" in writing what I have done but that of preventing people being led away by, to a certain extent, false Pear doctrine. Our foreign teacher has said many excellent things; but, in common with most foreigners, he does not know enough of either our climate or our productions.

In looking over the list of Pears given by M. de Jonghe, one cannot help regretting that instead of giving us 76 names of Pears, the greater part of which ripen in September, October, and November—when we have such Pears as Williams' Bon Chrétien, Beurré d'Amanlis, Marie Louise, Louise Bonne of Jersey, and many others—he had not given us the names of say just 20 varieties hardier than the above, and to succeed each other all through the season; this would have been a great benefit. We want the Marie Louise reproduced (for no finer Pear can be imagined), so as to be as hardy as a perry Pear, a hardy Glou Morceau, and so on. I have grown for some years nearly all those in M. de J.'s list. Many of them are much hardier than our older varieties, but none of them withstood the frost of last April. Some seedlings raised here did so; in particular a seedling raised from Beurré Gris d'Hiver Nouveau, one of the most tender varieties, and which was in full bloom on the fatal 25th of April last; and yet nearly every blossom set its fruit. This was the case with other seedlings. Now this seems the true way to acclimatise the Pear, and we must not rest till we raise Pears from seed in England as good as Marie Louise and Glou Morceau, and as hardy as our perry Pears, some of which do not know how to canker, and grow so freely as to be real ornamental trees (I may instance the Poplar Pear) in the most cold and unfavourable soils.

I ought to mention, for the information of your readers, that a few of the Pears in the list alluded to are known here by other appellations, having been received from Belgium with the following names attached:—Beurré d'Hardenpont as Glou Morceau, Beurré Hamacker as B. Hamecher, Conseiller de la Cour as Marechal de Cour, Fondante de Noel as Belle de Noel, Seigneur Esperen as Fondante d'Automne.

I may also remark that Colmar d'Aremberg is generally coarse and second-rate here, Delices de Jodoigne rots at the core, Doyenné Sentelet is too tender—it becomes deformed and cracks; Duchesse d'Angoulême, and its panachéd or striped varieties are rarely first-rate in England; Marie Louise Nouvelle is the sort generally cultivated here. I, however, received it under the above name and also as Marie Louise (Delcourt), and two or three other appellations. Colmar Nelis is our winter Nelis, Fortunée de Reumes is Fortunée (Parmentier), the Virgouleuse is a flat watery Pear in England; Calebasse Tougard cankers, and does not thrive as a pyramid. *Thos. Rivers.*

HEXACENTRIS MYSORENSIS.

This is certainly one of the most beautiful plants of recent introduction, and its value for decorative purposes is very much enhanced by its long drooping racemes of singularly formed bright yellow and crimson blossoms being freely produced in the dead of winter, when the best furnished collections possess few if any twining plant which for general effect can be compared with this. It is moreover a plant of extremely easy culture, forming a large specimen or covering a large space in a very short time, and is well worth a place wherever there is a warm house for it.

Those who do not possess it should obtain it soon, in order that it may be got into growth early in spring, so as to secure large plants for blooming next winter. The young plants should be placed in a warm part of the stove by the beginning of February, and as soon as they show any indications of growth, examine the roots, and if these appear to want more space shift into a pot a good size larger. If a mild bottom-heat can be commanded, this will assist in encouraging the production of roots.

Before starting the plant into growth any weakly shoot should be cut out, and the stronger ones may also be shortened back to prominent eyes. Keep the plant as near the glass as convenient and the atmosphere moist, syringing over-head every fine afternoon, but do not give too much water at the root until it starts into free growth. If it is intended to train the plant to a trellis it should be shifted into the pot in which it is intended to bloom it as soon as possible, in order to be able to train the shoots as they grow, and a plant that is well rooted in a 7-inch pot may be safely transferred to a 15-inch pot which will be large enough for any reasonable sized specimen. But as the beautiful blossoms are borne on drooping racemes, these are apt to find their way inside the trellis, and get partly hid by the foliage if an ordinary shaped trellis is used, and except in the case of those who have some particular object for growing it on a trellis it would be better to allow it to run along wires under the roof of a stove or intermediate house. Treated in this way it will be decidedly more showy than confined to the limits of even a large trellis, and will bloom longer and more profusely. I would not, however, advise that it should be planted out in a border, for it is of a very free habit of growth, and probably would flower but sparingly if its roots were allowed too much space. If a trellis is used, it should be spread out at the top, somewhat in the form of an umbrella, so that the flowers may hang clear of the foliage and shoots, of which there will be a large mass before it will bloom freely; and for a plant in a 15-inch pot the trellis should not be less than four feet across, for just in proportion as the shoots can be exposed to light in autumn will be the number and size of the racemes which they will produce. The plant need not be kept too warm after the trellis is well covered with wood, as a slight check will assist in inducing it to bloom freely; and, in the case of plants trained under the rafters in the stove, they should be kept rather dry at the root, and as freely exposed to air as circumstances will admit, while those that are moveable may be removed to a cooler house for a month or so. They should be removed to a light airy part of the stove for blooming, and when the racemes begin to appear thickly, manure water may be given once or twice a week with advantage. See that the foliage is quite clear of red spider before blooming commences, as heavy syringing after that time would be apt to spoil and break off the flowers. I have no doubt that where it is desirable to have this plant in bloom late in spring, that it may be wintered in a house where the temperature is just high enough to save the foliage (50° by fire heat will be quite sufficient for this) and roots from injury, and will bloom splendidly when placed in a moderate heat in spring, but it is perhaps most valuable for winter use. If young plants are provided to succeed those that have bloomed, the old plants may be thrown away as soon as their beauty is faded, but if they are to be retained for further use, they should be well rested before starting them into growth a second time, and the shoots severally thinned out, reducing the ball sufficiently, so as to allow of giving them a good shift in the same-sized pot. About equal parts of turfy loam, leaf soil and fibry peat, with a fair proportion of sharp sand, may be used for potting, but any rich light soil will answer, for it does not appear to be particular in this respect. *Alpha.*

PROPOSED EXPEDITION TO PERSIA.

We hasten to make public the following communications upon a subject which will probably interest many other gentlemen than those who belong to the Caledonian Horticultural Society.

Copy of a Letter from Lord Murray to the Caledonian Horticultural Society:—

Lord Murray is desirous to bring under the notice of the Council and Committees of the Horticultural Garden the expediency of employing a fit man to collect Fruit trees, Seeds of Melons, &c. &c., in Persia, and send them to Britain.

Most persons who have been in Persia agree that Peach, Nectarine, and Apricot trees and Melon seeds are better in Persia than in any other country, and may be purchased at very moderate prices. This is confirmed by the annexed extract from a letter from Sir John McNeill and his obliging offer to give his aid; and the appointment of the Honble. Charles Murray as Ambassador to Persia is a most favourable circumstance.

It is proposed that a subscription should be opened to all the Members of the London and Caledonian Horticultural Societies. Those subscribing 50*l.*, for instance, will receive fifty portions. Those subscribing 1*l.* will receive a proportionally smaller portion.

"102, George Street, Nov. 4, 1854.

"My Dear Lord Murray,

"It appears to me to be very desirable that your proposal to send a competent person to Persia to collect seeds and plants, especially of Fruit trees, should be acted upon. If it should be resolved to send such a person for that purpose, I shall be happy to furnish him with such information as I may have upon the subject, and with letters to such friends as I may still have in that country.

"I am not sure whether the route by Trebizond is open; but if not, other routes could be taken by a person going to Persia, and we may hope that the way by Trebizond, which is by far the best for the transport of plants, would be available before your employé would be prepared to return.

"Believe me, &c.

(Signed) "John McNeill."

We have reason to believe that Dr. Balfour, of Edinburgh, would willingly receive communications upon the subject of Lord Murray's suggestion.

HARDINESS OF SIKKIM AND OTHER RHODODENDRONS.

Report on the effects of the winter and spring of 1854 on the following Sikkim and other Rhododendrons at Preston Hall, 12 miles S.E. of Edinburgh, at an altitude of about 450 feet above the level of the sea. The lowest temperature was on the nights of the 2d and 3d of January, when Fahr. thermometer fell to 12° and 11° respectively. But the greatest injury was sustained by vegetation about the beginning of the fourth week of April, when, after some weeks of mild genial weather, there occurred several nights of sharp frost followed by days of bright sunshine; the lowest night temperature being 21° Fahr.

(Communicated by Sir W. J. Hooker, K.H.)

Rhododendron Falconeri.—Two plants in the open border were uninjured by the winter frost, but that of April completely destroyed all their terminal buds, which were then just bursting into leaf. The reserve buds, however, supplied numerous healthy shoots in the course of the summer, which seem to have ripened their wood, so that the April damage is now undistinguishable save by the bushy habit of the plants. One plant growing at the bottom of a stone wall with an east exposure, and slightly protected by Spruce branches, completely escaped injury, and has now a fine undivided stem about a foot high, with large healthy foliage.

R. argenteum verum.—One plant growing at the bottom of the stone wall along with the last, and protected in the same manner, was not in the least injured; it has now a single stem about 18 inches high, and its last formed leaves measure about a foot in length. I consider this to be the true species, as figured and described in Dr. Hooker's "Rhododendrons of the Sikkim-Himalaya," and which is rare at least in Scotland.

R. argenteum vulgare.—A plant in the open ground was uninjured by the winter frost, but lost its buds in April. In course of summer it produced several shoots which appear healthy, and seem to have perfected their wood. In Scotch collections this is much more common than the last, and although possessed of the characteristic large leaf-buds in spring, yet its foliage by no means corresponds with the last—being smaller, more rough, or wrinkled, and more dingy coloured underneath. Judging from the present appearance of the young plants they do not agree with any of those figured in the above-mentioned work, but present an intermediate like appearance between R. argenteum and R. Falconeri.

R. Hodgsoni.—The same remarks apply to this as to the first, R. Falconeri, only that the plant at bottom of wall, instead of only one, has several stems, the longest of which does not exceed 4 inches.

R. Thomsoni.—Several plants in the open ground all stood the winter admirably, but lost their terminal buds by the April frost. They however speedily produced numerous new shoots, with fine healthy foliage, which seems perfectly matured. Plants from 1 to 1½ feet in height, but as yet destitute of flower-buds.

R. Thomsoni ?.—A plant so marked was received from the late Mr. Cunningham, of Comleybank Nursery, Edinburgh. Can this be R. Candelabrum? Stood the winter, and was affected by the April frost, same as the last.

R. Dalhousiæ.—A plant was killed in winter 1852-3, although covered by a hand-glass, and another in winter 1853-4. I have not had an opportunity of trying this species on the stone wall along with R. Falconeri and some others, but doubt its succeeding.

R. Edgeworthi.—Several plants of this species stood in the open air uninjured till April, when they lost not only their expanding leaf-buds but also their old foliage. They all, however, pushed out numerous young shoots, which were in an immature state in October last, when they were all browned by a 31° night of frost, followed by hot sun, which cut up the Dahlias in the gardens of the neighbourhood, and even browned the tender leaves of second-growth shoots of R. ponticus and other common sorts in adjoining beds. A plant at the bottom of a stone wall with east aspect, which was covered with Spruce branches, escaped the April frost without injury.

N.B. I do not think that this species is so partial to peat as the other kinds. At least, the plants here which are grown in black heath peat mixed with white sharp sand have never attained that vigour of growth which I have observed in several instances when they were grown in a mixture of exhausted peat, light loam, and leaf-mould.

R. barbatum.—Several plants all in the open ground stood throughout the winter uninjured (two have been out three winters), but the whole had their first buds destroyed in April, the consequence of which was a rapid prolongation and after growth of the reserve buds; the plants assuming a dense bushy habit, which unless corrected by pruning, will prevent them assuming their natural tree-like appearance.

R. lancifolium.—The same remarks apply to the plant I have under this name as to the last. I have however great doubts of its being correctly named.

R. ciliatum.—Withstood the winter uninjured. Flowered in the open ground on the 24th March, but most of its flowers as well as its more exposed leaf-buds were killed by the April frost. The plants however soon recovered, and are now profusely furnished with flower-buds.

R. glaucum.—Of several plants, all equal in hardihood, the oldest was planted out when very young in autumn, 1851, and stood unscathed till the end of last winter. It flowered on the 12th of April, producing in all 29 heads or corymbs; these, being unprotected, were mostly killed by the succeeding frost, which, however, scarcely injured the leaf-buds. And the same plant is at present furnished with more than 70 flower-buds, it being about 1 foot high and 20 inches in diameter.

R. arboreum.—A plant of the old or originally introduced form of this species has stood unprotected for about six years at the bottom of a stone wall facing east but without making much progress, the young and generally vigorous shoots being less or more killed back every winter; like most others its swelling buds were destroyed by the April frost, but it is at present pretty well clothed with healthy foliage and ripened wood.

R. arboreum roseum.—Of two plants received under this name and said to have been from Sikkim, one stood in the open ground all winter uninjured; lost its buds in April, but recovered healthy

shoots and foliage. The other, which was planted at the bottom of an east wall, and covered with Spruce branches, was unhurt.

R. Campbellæ?—The only plant I have under this name stood the winter uninjured, but lost its buds in April. It much resembles the last, and I have never been satisfied of its being the correct sort.

R. niveum.—Uninjured by the winter, but had its buds killed by the April frost; the plants, however, soon recovered.

R. formosum (R. Gibsoni).—Stood throughout the winter and spring uninjured, at the bottom of a stone wall with an east exposure, and covered with Spruce branches.

R. campanulatum.—Old, middle-aged, and young plants all stood the winter without the least injury, and commenced pushing strong buds in early spring, from which the leaves were just protruding when the April frost destroyed the whole. The old plants flowered on the 29th March, and afforded a rich display of bloom till it was likewise killed by the April frost; and although a profuse growth of shoots was afterwards produced from the reserve buds, not a single flower-bud is to be seen upon them. One old plant, trained on a stone wall with east exposure, but otherwise unprotected, had only its buds and flowers (which protruded from the wall) injured; the latter, which rested on its surface, having since perfected seed.

R. campanulatum robustum.—In the nurseries and other collections about Edinburgh, five or six distinct varieties are known under this name; all of which differ from the common form of R. campanulatum in having larger foliage and a more robust habit of growth: and some, but not all, are further distinguished by having their bud-scales as well as the bark of their young shoots greenish instead of purplish coloured. In hardiness they all stand much on a par with R. campanulatum, having stood uninjured throughout last winter, but lost their expanding leaf-buds in April; and although their 1854 growth has been good, yet they are entirely destitute of flower-buds.

A variety known about Edinburgh as the Stanwell robustum produced its splendid flowers on the 6th of April. These were not much inferior in size to Hooker's figure of R. Dalhousiæ, of a delicate purplish shaded white at first changing to almost pure white, and strongly marked with dark spots. These flowers, as well as their embryo seed-vessels, were killed by the frost of April. The origin of this variety was a very small packet of seeds, received about 16 or 18 years since, marked "New Tree Rhododendron, from Nepal, with white flowers and rosy eyes," and distributed by the Highland and Agricultural Society of Scotland. It first flowered in Stanwell nursery, near Leith; and another plant of the same origin exists in the Dalkeith gardens, which, however, has not flowered.

R. Wallichi.—Stood uninjured throughout winter, but lost all its expanding leaf-buds by the spring frost. The use of the reserve buds under such circumstances was very marked in one plant, which had made a fine strong leading shoot the previous season topped with one leading on three lateral buds, all of which commenced growing in spring, and were consequently killed. Not having any reserve buds of the growth of 1853 left, the plant had to fall back on those of 1852, which have produced several healthy shoots.

R. Wightii?—Two plants (the produce of seeds received under this name by the late Mr. James Cunningham, of Comleybank Nursery) are greenish underneath the leaves, unlike Dr. Hooker's figure. They both stood uninjured throughout the winter, but lost their first expanding buds in April.

R. lanatum withstood the winter frost perfectly, but lost the leading buds in April—a check recovered in the growth of 1854.

R. fulgens.—One plant of this has stood for three, and several for two winters, without suffering the least injury until April last, when they had all their leading buds killed; but put forth numerous healthy shoots in the course of the season.

R. æruginosum.—Exactly like the last in hardiness, as well as in other respects, in so far as can be judged from the young plants—several varieties, or perhaps species, having been received under both names.

R. campylocarpum.—Several plants received under this name are in no way distinguished from R. niveum, which see.

R. cinnabarinum.—Quite hardy, not even having been injured by the frost of April last. Plant now (Nov., 1854) about 2 ft. high.

R. elæagnoides.—This species has stood two winters without sustaining injury from frost, even that of April last having done it no harm. Although grown in good heath peat, in which most of the other species seem to luxuriate, it has never presented a healthy appearance. In June last it produced two flowers of a deep purple colour, exactly resembling that of the flowers of the old well-known herbaceous plant Verbascum phœnicium.

R. anthopogon.—Have no Sikkim plants of this species, but others have stood in the open border for six years without sustaining the slightest injury.

R. setosum.—Withstood the two last winters as well as the frost of April, 1854, without suffering the least injury.

Rhododendron cinnamomeum.—This species has stood without protection for seven years, suffering occasionally in its flowers and leaf-buds from late spring frost, but never so much as in April last, when these were completely killed, its flowers having been fully expanded on the 10th of April, or about a fortnight before the frost occurred.

R. sp. from Kamoon.—The growth of this sort for five or six years has shown it to be equally hardy with the last, to which some of the plants bear so close a resemblance as not to be distinguished; while among others all shades of colour are to be found on the under side of the leaves, from that of cinnamon to almost pure white. Has not yet flowered at Preston Hall, but at Dalkeith Gardens, in the vicinity, several plants bloomed both in spring 1853 and in 1854; the colour being whitish with blackish spots, showing a further identity with R. cinnamomeum.

For comparison with the preceding, the effects of winter and spring 1854 on the following well-known species are here recorded, viz.:—

Rhododendron atrovirens.—Uninjured by the winter, having flowered profusely in March and beginning of April; but the severe frost towards the end of that month killed alike the remaining flowers and few expanding flower-buds, as well as some of the most advanced and exposed leaf-buds. The plants are now (Nov. 5) richly clothed with flower-buds.

R. catawbiense.—Uninjured either by winter or April frosts, the buds having scarcely commenced their expansion when the latter occurred, except in exposed sunny places, where a very few of the most prominent flower-buds were wholly or partly destroyed.

R. caucasicum.—Uninjured by the winter; but about half of the flowers having been expanded and the rest very far advanced when the April frosts occurred, the whole were killed or too much injured for producing seeds, while a few of the principal leading shoot buds were also injured.

R. ferrugineum.—On some plants a very few of the most exposed flower-buds suffered injury from the April frosts, but were otherwise unharmed.

R. maximum.—Unharmed by either winter or spring frost farther than having a few of its long slender leaves broken by wind when in a frozen state.

R. ponticum.—Of numerous plants of this species in various situations and exposures, some which had made late autumn or second growth shoots had their unripened points injured by the winter frost, and when exposed to both sun and wind a good deal of their foliage was browned. The April frost, however, did little injury farther than destroying a few of the most exposed flower-buds.

R. punctatum majus.—This species sustained no injury through the winter; but the frost of April killed the whole of its flower and leaf-buds except on such parts of the plant as were protected by overspreading foliage.

Rhododendron arboreum, mas.; *crossed with R. campanulatum*, fem.—Of about a dozen eight-year-old home-raised plants of this cross none have yet flowered, and although in foliage and habit they present a decided improvement on R. campanulatum, yet they are more susceptible of injury from cold than that species, or even than any of the following classes of hybrids. The frost of last winter having not only destroyed the leaves on the more exposed shoots, but also cracked the bark on some of the stems; while that of April destroyed every leading bud, injuries which have, however, been in a great measure repaired by the 1854 growths from the reserved buds.

Four plants, the produce of seeds received 10 or 12 years since as "*Tree R. from Simla*," seem identical with this cross in foliage, habit, and hardiness. Two of these flowered last spring, the one of a pale whitish, and the other a light rose colour. The former being in the open ground had its flowers killed in April; but the latter being on an east wall escaped injury, and has ripened its seed.

R. arboreum, mas., *crossed with R. caucasicum*, fem.—This comprises a numerous class of scarlet flowering hybrids, dwarfish in habit, of which the well-known R. noblianum is typical. The frost of last winter killed a few of their earliest and most exposed flower-buds; while that of April killed all their flowers and most of their expanding flower-buds, as well as leaf-buds, unless in the centres and lower parts of the bushes, when the shelter of the upper foliage protected them. Plants, however, which were close trained on a stone wall with east aspect entirely escaped and perfected their seeds, as did also those of the next three races.

R. arboreum, mas; *crossed with R. catawbiense*, fem.—This cross, of which the old R alta-clerense is a good representative, stood last winter without sustaining injury in either foliage or leaf buds, and but very slightly in some of the most exposed flower-buds of the earliest flowering varieties. The April frost, however, killed most of the swollen leaf buds, as well as the expanded and nearly expanded flowers; but on the latest plants the flower buds almost escaped injury. In foliage, flowers, habit, and hardiness, the produce of this cross generally is superior to either the last, or two next races of "scarlet-flowering hybrids."

R. arboreum, mas.; *crossed with R. maximum*, fem.—The last winter's frost proved hurtful to the flower-buds, as well as to the foliage of this tribe; while the frost of April killed most of the remaining flower-buds, and all the expanding leaf-buds. The foliage of this cross, from its slender, open, and loose habit, is peculiarly liable to injury from winds, especially when in a frozen state.

R. arboreum, mas.; *crossed with R. ponticum*, fem.—This tribe proved much the same as the last in respect of hardiness, both in winter and April, its loose habit of foliation rendering it also subject to injury from frost-winds.

Note. There is in the gardens at Dalkeith Palace a large old grafted plant of R. arboreum, which, for size and form of flower, as well as in the compact habit of its corymbs, may be said to bear the same relation to the common forms of R. arboreum that R. catawbiense bears to R. ponticum. Having been kindly favoured with a supply of pollen of this plant, I have with it crossed both the last-named species, but the plants being only two years old, little can yet be said regarding them; only among the plants from R. ponticum are a number with very peculiar long Willow-like leaves, much narrower than those of either of the parents. (Can this Dalkeith R. arboreum be the R. Nilagiricum or R. nobile, No. 19, page 3 of Conspectus ** in Part II. of Hooker's "Sikkim Rhododendrons?")

R. campanulatum, mas.; *R. ponticum*, fem.—None of the preceding races of hybrids equal this in the size and vigorous healthy appearance of its foliage, which is retained in the old wood as in the female parent, not falling off, like that of the male, when little more than a year old. Plants about two feet high, but which have not yet flowered, stood last winter without sustaining the least injury, but lost most of their leading buds in April.

R. cinnamomeum, mas.; *crossed with R. ponticum*, fem.—The plants of this cross are still smaller and younger than the last, consequently have not flowered. They stood throughout last winter without injury, but lost all their swollen leaf-buds in April. When first expanded, the leaves are of a bright, golden, yellowish colour, which goes off as the season advances, till in autumn they become darkish green. And it may be remarked, that in their earliest stages they are somewhat liable to become browned or scorched when exposed to hot sunshine. A few plants, which had not ripened their young wood and foliage in October last, had their youngest leaves browned by a Dahlia-killing night of frost. *William Gorrie, Preston Hall, Ford, by Dalkeith, Dec. 9, 1854.*

Home Correspondence.

Beurré Superfin and Cumberland Pear.—There is nothing which I desire so much as to learn with certainty anything which may tend to establish the history of a remarkable variety of Pear. With regard to an American Pear called the Cumberland, I read about 20 years ago the following description in the "New American Orchardist," by William Kenrick, Boston, 1833:—"This native Pear is stated by Mr. Smith to be extraordinary for its size and beauty, some specimens having weighed nearly a pound. The colour is yellow or orange, with a bright blush of crimson next the sun; the flesh is rich, juicy, and melting; little inferior to the old St. Michael. The original tree was first shown to him in 1830, growing in Cumberland, Rhode Island. It is about 30 years old, apparently hardy and free from blight. It ripens in autumn, and may be kept till into winter." Is this description, as regards the colour of the fruit, applicable to the one found at page 171 of the second volume of the *Album de Pomologie* published at Brussels in 1849? I do not think so. In the description above quoted, nothing is said of the habit of growth of the tree; the form of the fruit is likewise omitted. There are only the weight, colour, some qualities of the fruit, and the time of ripening. These, I am aware, may differ in different latitudes. For one accustomed to study trees of a certain age, cultivated on the Pear stock, it is necessary to examine the tree minutely before the identity of a variety can be established. Is Mr. Robert Hogg in the position to make such examination with respect to his own trees, or those of his friends? Has he had, growing under his own eyes, the Cumberland Pear, generally attributed by the amateurs here to sowings made by the late Van Mons, and which fruited in the nurseries of Louvain in 1827, and previously? Has he compared this variety with that described in the "New American Orchardist" in 1833? Has he, on the Pear stock and in a bearing state, the variety which appeared at Angers, about 1845, under the name of Beurré Superfin? If these indispensable comparisons have been made, then, and then only, will he be in a position to determine with certainty and settle the question. In his catalogue published in 1823, and in the manuscript one at present in the hands of his successor, Van Mons has never attributed to himself a variety which was not raised by him. His authority is certainly as good as those of Mr. Smith and M. Goubault. Besides, this would not be the first time that we have seen several of our best varieties of Pears invested with new names, I do not say in England, for I know of no case that I could cite, but I could name at least 10 varieties which have experienced elsewhere this fate, either owing to culpable speculation or for other motives. But at present this question is not the one with which we have to deal. It is simply whether the Beurré Superfin has a different form, a different flavour, and period of maturity from that of the fruit figured in the *Album de Pomologie* above referred to. If this difference be fully established, and of this I am doubtful, I must consider the trees received, for the last eight years, from respectable nurserymen, and from the most direct sources, as nothing else than the Cumberland of Van Mons; and all the trees observed, in the above period, in the gardens of my friends, doubtless obtained from the same sources, are identical with mine. The description of the tree and fruit of the Cumberland Pear in the *Album de Pomologie* is, in general, very correct, and agrees with vigorous trees in my nursery and with their fruits. It is usual to refer to established descriptions; and I have taken the most prominent characters. It is not difficult to make a very correct description when one is acquainted with the proper terms and is daily in the habit of laying down the distinctive characters of new varieties taken into cultivation. *J. de Jonghe, Brussels, Dec. 17.*

Dioscorea Batatas.—In a leading article in last week's Paper (Dec. 23), it is stated that I failed in inducing the Dioscorea Batatas to produce tubers. This statement is perfectly true; at the same time, in fairness, it ought also to have been stated that the plants were only under my charge for 12 days. A farmer might as well be expected to sow his Wheat in one week, and reap it the next. The plants of the Dioscorea were in good condition when received on the 26th of July, 1854, from the administration of the Museum of Natural History of Paris, and were left in a healthy growing state on the 7th (12th) of August. *Robert Thompson.* [There was no intention to be unfair to our worthy friend. But as he planted the specimens in question, he made all the preparation that was expected to ensure success.]

Storing Beet.—Some time ago there was something said about keeping Beet-root. I have sent two roots for inspection. No. 1 is part of the crop of 1853, of which I have a good many left quite sound; No. 2 is from the crop of 1854, and is sent to show the difference of the two, which are both from the same stock of seed. The colour of No. 1 is very much changed, and some of the same crop has lost all its sweetness. My plan of keeping Beet is to store it in a cold dry shed after it is thoroughly dry among dry sand. *Vindex.* [Of the two roots sent No. 1 had begun to decay, the other was quite sound.]

Societies.

Caledonian Horticultural, *Dec. 7.*—At this meeting office-bearers were elected for the ensuing year, and several new members added to the list of Fellows. Premiums were awarded as follows, viz.:—For 6 dessert Pears: 1st, Mr. Morrison, gr. to R. Ainslie, Esq., with Marie Louise; 2d, Mr. Wyllie, Ninewar, with Crassane; and 3d, Mr. Anderson, gr. to the Earl of Stair, with Beurré d'Aremberg. Best collection of dessert Pears: 1st, Mr. Wyllie, with Crassane, Beurré d'Aremberg, Easter Beurré, Beurré Rance, Beurré Diel, and Duchesse d'Angoulême; 2d, Mr. Morrison, Elvingston, with Beurré Diel, Gansel's Bergamot, Napoleon, Marie Louise, Crassane, and Beurré d'Aremberg; and 3d, Mr. Anderson, with Beurré d'Aremberg, Beurré Diel, Easter Beurré, Crassane, Winter Nelis, and Colmar d'Aremberg. Best 6 dessert Apples: 1st, Mr. Morrison, with Ribston Pippin; 2d, Mr. Calder, also with Ribston Pippin; 3d, Mr. Addison, Gosford, with Borsdorffer; and 4th, Mr. Young, Archerfield, with Blenheim Pippin. Best collection of dessert Apples: 1st, Mr. Young, with Ribston Pippin, Blenheim Pippin, Hollow-eyed Pippin, Borsdorffer, Scarlet Nonpareil, and old Nonpareil; 2d, Mr. Crocket, Raith, with Blenheim Pippin, Ribston Pippin, Scarlet Nonpareil, Hubbard's Pearmain, Court of Wick, and Syke House Russet. Best bunch of retarded Grapes: 1st, Mr. Crocket, with Muscat of Alexandria; 2d, Mr. Gavin, Hopetoun, with White Nice; and 3d, Mr. Morrison, with Black Hamburgh. Best 12 Chrysanthemum blooms: 1st, Mr. Young, with Defiance, Queen of England, Duke, Triumphans, Annie, Warden, Princess Marie, Goliah, Dupont de l'Eure, Nonpareil, Formosum, and Plutus; 2d, Mr. Addison, with Queen of England, Princess Marie, Cloth of Gold, Salter's Annie, Defiance, Pio Nono, Duke, Warden, Beauty, Dupont de l'Eure, Formosum, and Queen. The prize for the finest flowered Chrysanthemum in pot was awarded to Mr. Addison, for Queen; a second was voted to Mr. Crombie, Cramond, for Salter's Annie. Best 6 blooms of Anemone flowered Chrysanthemums, 1st, Mr. Young, with Marguerite d'Anjou, Fleur de Marie, Gluck, Norah, Madonna, and Cleopatra; 2d, Mr. Noble, Belleville, with Fleur de Marie, Gluck, Madame Godereau, Marguerite d'Anjou, Nancy de Lermet, and Racine. For the finest flowered Pompone the prize was awarded to Mr. Young, the kind being Ne Plus Ultra. In Leeks: the prize was gained by Mr. Cleghorn, Ayton Castle, Berwickshire, for a variety named Giant. In red Celery: the prize was awarded

to Mr. Ferrier, Eskbank. The prize for White was gained by Mr. Goodall, Newbattle, with Goodall's Broad White. Onions: 1st, Mr. Lees, Tyninghame, with James' Keeping and White Spanish; 2d, Mr. Young, with Strasburg. Savoys: 1st, Mr. Porterfield, Hermitage, with Dwarf Cape; 2d, Mr. Lees, with Hardy Green. Broccoli: 1st, Mr. Goodall, with Snow White; 2d, Mr. Reid, Broomfield; and 3d, Mr. Addison, with Stewart's Broccoli. The Silver Medal offered by the Society for the best collection of dried specimens of British Flowering Plants and Ferns was awarded to Mr. James Hogg, journeyman gardener, Leith Walk. The collection contained about 650 correctly-named species. An award was voted to Mr. Mitchell, Panmure Gardens, for an Essay on the Training and Management of Fruit Trees on open walls in Scotland. The Hon. Lord Murray sent a peculiar concrete substance called "Mushroom stone," which he had received from Naples, and the Superintendent was requested to try its efficacy in the garden.

Notices of Books.

Among the small works on our table hitherto unnoticed we find the following. The *Head and Heart* (Bale): 160 8vo. pages of readable matter, and many woodcuts, calculated to produce a good effect upon young people, for a shilling.—*Remarkable Sieges* (Ingram) is another shilling volume, beautifully printed, and illustrated with woodcuts of considerable merit. It records the sieges of various great places, from that of Constantinople, in 1453, to the unfinished operations against Sebastopol, of which place there is one of the best views that have yet appeared. The subject will make this volume popular at the present moment; but we think Mr. Ottley would have done no injury to his reputation had he avowed the sources from which his "observations on fortification" have been taken *verbatim*, or nearly so. Does he imagine that "Sir John Jones's Sieges" is a work that nobody reads except himself?—*The Angler's Almanac* (Cox) will, we imagine, be acceptable to those who take pleasure in the amusement.—*Rejected Addresses* and *Taylor's Notes from Life* (Murray's Railway Reading) are reprints of well-known works of standard excellence, and will be welcome to everybody who can only afford to buy sterling literature at a low price. For ourselves, we greatly prefer these charming miniature editions to those of more pretence, even irrespective of their cost.—*The Monastery and the Mountain Church* (square 18mo, Murray) is a new work by the clever author of "Sunlight through the Mist." Intended as it is for the inculcation of high moral and religious principles in children, it cannot be otherwise than acceptable to parents. When we add that it is well printed on good strong paper which will bear "thumbing," is written in a simple style, with few "hard words," and is embellished with clever pen and ink sketches, we need not add that it is a book which may be heartily recommended.

Of *Murray's Official Hand-book* a new edition, corrected to the latest moment, has just appeared. It is superfluous to say that this work is indispensable to all persons who wish to be well informed respecting the civil, military, judicial and ecclesiastical administration of their country. For ourselves we regard this as the most generally useful of all Mr. Murray's hand-books.

Sowerby's Popular British Conchology (square 18mo, Reeve,) gives as good and well illustrated an account of the shells of our country as is possible in a work which is professedly popular and nothing more. It forms a very good introduction to the more scientific works on general conchology of the same publisher. To young people it is more especially useful, and will become, we have no doubt, a constant companion at the sea-side.

Traditions and Superstitions of the New Zealanders. By E. Shortland, M.A. 12mo. Longmans. Pp. 300. —Mr. Shortland lived long enough in New Zealand to become thoroughly acquainted with the religious as well as domestic habits of the natives and the ancient myths which abound in the traditional history of all uncivilised people. The result he has given in a volume that will be read with satisfaction by all who take an interest in the origin and analogy of nations. The only bit of Natural History we have met with is the following:

"*The Vegetable Caterpillar.*—The moth from whose eggs are produced this caterpillar is of the genus sphinx, and is named by the New Zealanders *pepe*. Its period of life is from November to December—the commencement of the summer in their country. Its caterpillar, called by the natives *awheto* or *hotete*, makes its appearance in the eighth month, viz., the end of January, and feeds on the leaves of the *kumara* and *pohuehue* plants, both of them varieties of Convolvulus, and also on the flowers of a tree called *rata* (metrosideros robustus), which is of the same order as the Myrtle. This insect is very destructive to the *kumara*, which forms so favourite an article of the New Zealanders' diet; and a great many persons are constantly employed in their gardens to pick them from off the leaves of that plant, for several weeks in the year. It is a common belief, however, that the caterpillar is rained down from the sky: for although vast numbers are destroyed by them day after day, many more are still found to reappear. About the end of the eighth or the beginning of the tenth month, this caterpillar buries itself in the ground to the depth of 5 or 6 inches, previous to assuming the chrysalis form; and it is a singular fact, that the insect descends into its subterraneous hiding-place with its hind-part downwards. Such is the position in which it is invariably found. Were its position reversed, it would perhaps be impossible for the moth into which it is subsequently transformed to escape. In the second month of the following year small reed-like plants, about 3 or 4 inches high, may be seen growing in great numbers from the ground under the shade of the *rata* trees. This plant being dug up carefully is found to grow out of the head of the caterpillar just described, which, however, no longer possesses any vitality; for cutting into its body, it is found to consist of a tough whitish substance, similar to a fungus. In this state it is collected by the New Zealanders, and after having been hung up to dry for some time in their houses, it is burnt to a coal; the coal supplying them with an excellent black pigment, which is much used in the operation of tatooing. In the tenth month the reed-like plant dies away, but springs up again the following year, dying again in the tenth month, and sending out a fresh shoot in the second month yearly for three or four years, probably till all the animal matter supplied by the caterpillar has been consumed. I have sometimes met with specimens in which the plant grew from other parts of the body than the head; but in all these the upper part of the body was deficient, and it appeared to me that it might have been destroyed by the rooting of pigs or otherwise, and that the plant had afterwards thrown out a fresh shoot from the summit of the part left in the ground. The reed-like plant just described is the fructifying part of a fungus; and the part which was once the body of a caterpillar corresponds with what botanists call its mycelium, and gardeners call its spawn. While burying itself in the ground no doubt some of the germs of the fungus lying scattered on the ground become attached to the skin of the caterpillar, and there developing with the extraordinary rapidity known only to this class of vegetable, kill the animal while in its torpid state, and very soon occupy the whole of its body, so as to correspond with it exactly in form."

John Waterer's Catalogue of American Plants for 1854-5 is before us, and should be procured by all growers of this beautiful race. We cannot undertake to enumerate the novelties which are therein announced, but we must find room for the practical directions which Mr. Waterer gives for their cultivation.

"'American Plants,' then, as may be premised, include certain genera, all belonging to the natural order Ericaceæ; the principal species, from which the best varieties have more recently been raised, having been originally introduced from the American continent. They are all more or less beautiful; but the Rhododendrons and Azaleas are especially remarkable for their dazzling colours and the profusion of their flowers, which, when displayed on a grand scale, as in our London exhibition or in our Nursery, present a scene which admits of no parallel. They are all connected by certain and easily recognisable affinities; and therefore, when we speak of soil and general culture, we wish it to be understood that our directions are equally applicable to the whole tribe. There can be no doubt that, compared with other hardy evergreen flowering shrubs, they present one or two features peculiar to themselves; yet long experience has given us the fullest opportunities of forming an opinion on the point, and we venture to presume that we have some claim to be heard. Let none be discouraged, then, in their first efforts to grow these beautiful plants; for we have no hesitation in asserting that they may be successfully managed with only the exercise of ordinary care and intelligence, without which the most elaborate dissertation, or even specific directions, would be of little or no avail.

"The plants of which a tribe or order is composed are characterised by a particular constitution. This remark is especially applicable to those now under consideration. It has long been known that Cape Heaths—forming the type of the order to which American plants belong—have never been grown in France, Belgium, and many parts of Germany, to the same perfection as in England; and the cause assigned has been chiefly the want of proper peaty soil, without which these beautiful greenhouse and hardy plants will not thrive, however favourable other circumstances may be. This fact, however, has been frequently urged as an argument against the possibility of growing Rhododendrons, and other genera known as American plants, except in a certain kind of peaty soil; and it is unfortunate for the tenability of an opposite position, that the objection has derived apparent weight by being associated with isolated cases of failure. Yet nothing can be more erroneous than the supposition that there is any difficulty in supplying them, in almost every locality, with soil sufficiently fertile for all practical purposes.

"That some districts are more favoured than others, as respects the composition of soil, cannot for a moment be doubted; and it is perfectly true that a rich, well-pulverised peaty soil is the most preferable for these plants; but we have only to visit such places as Sion, the seat of the Duke of Northumberland; Kenwood, the seat of the Earl of Mansfield; and other famed gardens round London, to perceive that Rhododendrons will grow in any kind of good and fertile soil to great perfection, and that they will even propagate themselves to a wonderful extent, covering large plots of ground in wild luxuriance and beauty, as freely as if growing on the borders of an American forest. Indeed, there are numerous instances of their thriving well in what is called a light, friable, fertile loam, of which the much-prized peat forms but a very insignificant part; and we may safely say that there is no soil in which plants can be grown at all that is not equally suitable for growing Rhododendrons: and no tribe of plants admits so readily of being removed at almost any season. They can be easily taken out of the ground, even when nearly in flower, and conveyed to any part of the country, without suffering the least injury; so that a whole garden may be furnished with a mass of bloom with little more than a week's notice, or plants already established may be removed on any emergency, about their flowering time, to positions where they may be required to increase the effect or add to the display, either into large pots near the house or planted out.

"But, though American plants are not so strictly exclusive in their predilections as may have been supposed, it should not be forgotten that a rich peaty soil is that which most accords with their natural constitution. Yet it is scarcely necessary to state that this soil may be found more or less plentiful in every county in England. Peat, it must be remembered, is composed of certain vegetable substances which have undergone a long and slow process of decay. These substances are chiefly the softer portions of trees or leaves, of nuts, tender twigs or branches, and other *débris* generally abounding in forests. When it is desired, therefore, to provide a good substitute for peat, nothing will be found more suitable than 'leaf-mould,' or rotten leaves mixed with a portion of light sandy soil. Another mode of meeting the want of good bog is to prepare a compost in the following manner:—Collect several loads of what is called the top or surface spit of any plantation, wood, or even Grass field; and the more this surface is impregnated with decayed vegetable particles the better. The thickness of the spit will depend, of course, on circumstances, being more or less according to its composition. When a supply has been obtained, it should be thrown together; then carefully and freely mixed with leaf-mould, or old and well-rotted dung from a Melon frame. In this operation the turfy parts should not be chopped fine, but preserved as rough and large as is compatible with the mixture of the whole mass. When the plants are to be planted in beds, or compartments of more irregular outline, the average depth may be stated at about 20 inches. To this depth the soil should be taken out, and an equivalent portion of the compost already described placed in its stead. At the time of planting, should the weather be very dry, nothing is of greater importance than a copious supply of water. This injunction is the most urgent during the first season; for after they are fairly established there is, comparatively speaking, but little to be apprehended. In very dry seasons, however, every precaution should be observed to prevent the balls of earth round the roots from becoming too dry—an evil to which they are liable in elevated positions.

"We may just state, in conclusion, that we merely offer these directions respecting soil for the benefit of those who may have ready access to a plentiful supply of leaf-mould and the other ingredients of a rich compost; but we beg to repeat that American plants will grow in any ordinary garden soil, and therefore all who are desirous of having a display of their beautiful flowers need never be deterred from attempting to grow them from a fear of failure and disappointment."

We certainly cannot undertake to endorse the whole of this statement; we can only give it as that of a very celebrated and experienced grower of American plants, who we doubt not is as willing as he is able to substantiate all he says. The Catalogue itself includes a very large and select assortment of fine varieties.

FLORICULTURE.

Carnations.—I will thank you to say to what causes the running of the Carnation is attributable, other than freshness and excess of manure (supposing stable-dung the kind used). In 1851 a number of Carnations and Picotees bloomed fairly with me in the open ground, except Yeomanson's Triumphant, crimson bizarre, which was very much run and ill-shaped. In 1852 the layers from this flower did not bloom; they were grown in pots. In 1853 layers from these again were grown in pots, in compost of loam and leaf-mould, equal parts, with the addition of a half part stable-dung, and a little sand and gypsum. They bloomed extremely well, both in shape and colour, while many others, grown in the same compost, and treated like them, ran. This year my Carnations were growing in the open ground, in what had been a border containing principally herbaceous plants; this was trenched in the last autumn (just before the layers were planted in it) 2 feet deep, and a little fresh soil and a very little old manure added. It was top-dressed with an inch of very old horse manure this spring, and occasionally watered with very weak manure-water. The aspect is south; the flower-garden is a perfectly horizontal bit of table land on the side of a hill, and extremely warm. The plants were unprotected from rain, sun, or frost the entire year. Now, the layers taken from the plants of Yeomanson's Triumphant that bloomed so well last year, this year all ran (10 plants), as well as a number of other Carnations, and this in the very slightly manured bed that I have just described. The garden is well drained. Would you say at the same time what the best compost is for potting Carnations and Picotees in for blooming, making a difference, if such is necessary, between that for varieties apt to run, and that for others? *Dianthus.*

[It is evident from our correspondent's own showing that his plants have been too highly manured. The

compost of 1853 was much nearer the mark. We do not recommend liquid manure applied at an early stage of their growth. It is best given when the colour can be ascertained to be correct by raising the point of the pod. We think that the bed which was trenched 2 feet deep, and fresh soil and old manure added at planting time, and then top-dressed in spring with an inch deep of old horse manure—the plants being watered with liquid manure—would be too rich. An excellent compost for Carnations and Picotees is 2 parts rotten turfy loam, 2 parts leaf-mould, 1 part rotten horse-dung, 1 part sharp river sand ; mixed and well incorporated at least 12 months previous to using.]

Miscellaneous.

Botanic Garden, Glasgow.—We are glad to see, from the annual report just published, that this institution is in a prosperous state. The income last year was 1065*l*, and the expenses only 955*l*, although the cost of a horse was charged to expenses instead of to capital.

Exaggerated Descriptions.—An English horticultural periodical is quoted as describing the new Rose, the "Duchess of Norfolk," as a "brilliant coloured climbing Hybrid Perpetual Rose"—the term climbing being merely an exaggeration of its vigorous growth. This kind of exaggeration is, we believe, not entirely new with English gardeners, more particularly in describing colours. It ought not to be tolerated among horticulturists, whose language should be as pure and truthful as the beautiful forms they cultivate. Falsehood and elegant Roses make a bad mixture—and we might with equal propriety describe the Bartlett Pear as a foot long, and the Winkfield as so productive that 200 bushels are usually produced per tree the third year. *American Paper.*

Sale of Pear Trees.—A collection of about 300 pyramidal Pear trees from M. De Jonghe, of Brussels, both on Quince and Pear stocks, and from three to four years old, were sold by Mr. Stevens, at his rooms in King Street, Covent Garden, on Saturday last. The collection consisted for the most part of new kinds, or others little known in this country. They fetched from 1*l*. to 2*l*. per lot of six sorts, with the exception of one lot (40) which was sold for 4*l*.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Any specimens in pots of the more valuable hard wooded plants which it may be necessary to winter in this house should be frequently examined, turning them partly round every week to expose the foliage equally to light, for, when in unsuitable quarters, they are sure to suffer from the slightest neglect. Keep such things as near the glass, and as much in the way of air as circumstances will admit. The beauty of the earliest portion of the Camellias will probably be over for the season, and when this is the case let them occupy a comparatively cool house, and have all the light possible until their buds promise a close bushy growth, for plants when grown year after year at an early season are apt to become thin unless care is taken to have plenty of buds well up before placing the plants in heat. Endeavour to maintain the greatest possible amount of gaiety here at present, and never allow any plant to remain in the house after it becomes unsightly or shabby if anything better can be found to supply its place. Let Cytisuses and other early flowering greenhouse plants occupy the coolest part of the house where air can be admitted on favourable opportunities. Cold Pits.—The inmates of these structures will require but little water for some time to come, and the little that may be necessary should be given early on a fine morning, when air can be given to dry up the atmosphere before night. Look over the Heaths and anything else that is liable to the attacks of mildew frequently, and apply sulphur the moment this pest makes its appearance. Also guard against the ill effects of damp by giving air whenever it can be done without risk, but do not expose the stock to cold north or north-easterly winds, which seldom fail to turn the foliage brown and rusty. Stove.—If there is any prospect of a scarcity of plants in flower next May, a portion of the Gloxinias and Achimenes which have been the longest at rest may be started at once, as also a few Clerodendrons. The latter should be cut back to the lowest eyes, so as to secure having bushy specimens, and the pots covered with foliage, and when they fairly start into growth the balls should be reduced sufficiently to allow of giving a good shift of fresh soil without increasing the size of the pots. A few of the Allamandas may also be pruned and placed in heat, provided the wood is well ripened. Where there is not the convenience of a house that can be kept at a rather high temperature for such things as it is desirable to push into growth at this early season, they should be placed in a bottom-heat of 80° or 85°, which will encourage the roots, and render a high atmospheric temperature, or over-driving the other inmates of the house less necessary.

FLOWER GARDEN AND SHRUBBERIES.

The weather is still exceedingly favourable for the execution of alterations or new work, and it will not be the fault of the weather if such work is not finished in good time this season: but we know from experience that it is, in many cases, easier to commence such operations than to know where or when they will end; and we would merely recommend here that every possible dispatch should be used to get all such operations finished as speedily as possible, in order to have the hands at liberty for the regular work, which, save in a few favoured cases, will soon require all the labour that is allowed. If not yet done, the leaves should be cleared up, and the shrubbery borders lightly dug over, to give them a fresh appearance. Lawns and gravel walks must be frequently rolled, so as to keep them firm and smooth. Those who purpose planting in the spring—for many persons still retain the notion that planting can be done in spring with greater certainty of success than at any other season—should lose no time in getting the ground prepared by trenching, or whatever may be deemed necessary, and the pits for the plants thrown out, so as to secure having friable soil for planting in. On light sandy soils there will be no particular necessity for making the pits at once; but, however friable the nature of the soil may be, it will be all the better for exposure for a month or two to the action of the weather. Where Rhododendrons are grown in masses, and exhibit any indications of having exhausted the soil, a top dressing of rotten cow manure, some 3 inches deep, and extending as far as the roots, should be applied at once. This will strengthen the plants for flowering, and will prevent rapid evaporation in summer, and keep the ground cool and moist, which is essential to the well-being of this handsome tribe of plants.

FORCING DEPARTMENT.

Pineries.—The supply of ripe fruit from May until August being usually obtained from plants that start into fruit without making growth in spring, therefore a fair proportion of the stock should be in a well matured state by or shortly after this season, and any sudden changes of temperature which might induce too many of them to show fruit at once should be carefully avoided. That portion of the stock expected to furnish the autumn supply of fruit should not be too much checked at present, indeed these may be kept growing slowly all the winter, which is perhaps the most certain method of preventing their fruiting too early in spring. Where the stock of plants likely to fruit without making farther growth is considered insufficient to meet the demand until August, the stronger plants of those for autumn fruiting should be encouraged to make growth as early as can be done without weakening the foliage, with the view of preparing them for showing fruit in April. Examine the soil occasionally about young stock growing in the open bed, and do not allow it to become unhealthily dry, for this would probably result in a great portion of the stock showing fruit prematurely, and it is also a work of some difficulty properly to moisten the bed if it is once allowed to get too much dried up. Use no more fire-heat for the present than will suffice to maintain the requisite temperature, which, for the general stock, need not be high for some time yet. Vineries.—Although the day temperature must be raised to about 65° as soon as the buds are fairly started, this should not be exceeded by fire-heat, but a rise of 10° with the assistance of sunshine may safely be allowed; still on cold cloudy days it will be advisable to be rather under than over the mean, taking advantage of bright days to keep considerably higher, for there is but little gained by maintaining a high temperature in the partial absence of light. Where fermenting material has been used inside the house, this should be removed as soon as the leaves make their appearance, but the atmosphere must still be kept comparatively moist by means of sprinkling the floors, &c. The foliage should, however, be allowed to become dry every day, for should it escape the attacks of mildew, there is great risk of its getting scorched early in spring, if the atmosphere is kept constantly saturated with moisture. Give careful attention to the roots, and where it is not attempted to warm the border, see that it is efficiently protected from wet and sudden changes of the weather. If fermenting materials are used, be prepared to make additions in the event of sharp weather setting in, and endeavour to secure a regular gentle warmth. Let Vines in pots, or boxes, being forced, be well supplied with strong clear manure water, using it in a tepid state; these will also enjoy an occasional top dressing with rich materials. Get the Vines in the late house pruned, and everything about the house cleaned, &c., directly the Grapes are cut. Where Strawberries are wanted early, a portion of the stronger plants may now be selected and placed in a pit where they can be afforded a gentle bottom heat, or in a Vinery or Peach-house which has just been closed for forcing. They must, however, be kept close to the glass, for they require all the light that can possibly be afforded them, and a free admission of air on mild days, and if these conditions can be combined with a mild bottom-heat, success will be more certain than under any other circumstances.

HARDY FRUIT AND KITCHEN GARDEN.

Make a point of examining all the choicer fruits that are approaching ripeness, or are found not to be keeping well, every week, so that everything may be used at the proper time; for some of our best Pears are worthless enough if allowed to get over ripe before using, and the same is the case with many varieties of Apples. Also look over the whole stock when time can be spared, removing any that exhibit symptoms of decay, and putting them aside for immediate use. Any of the choicer kinds that do not appear to ripen properly in the fruit-room should be removed to a warm dry room for a few days. Keep the fruit-room as dry as possible; and if frost is excluded, it cannot be too cool. Push forward pruning, nailing, tying espalier trees, and such like tedious operations, as fast as the weather and circumstances will admit; also see to having manure in readiness to be wheeled upon vacant ground when frost occurs. A dressing of fresh loam is in many cases preferable to manure for land that has been long cropped with vegetables, and where this is wanted, and can be obtained, it should be got to hand, in order that advantage may be taken of favourable weather for heavy wheeling. Where fresh soil cannot be obtained, charred vegetable refuse, such as prunings of shrubberies, edgings of turf, and many things which turn up in the course of the season, will form an excellent substitute; and there are few gardens that would not be improved by a dressing of charred vegetable matter.

The highest temperature during the above period occurred on the 1st, 1852, 1st, 1851, 5th, 1844, and 6th, 1845—therm. 54 deg.; and the lowest on the 2d, 1854—therm. 4 deg.

Notices to Correspondents.

Beet Root: *H A B.* Pull off the leaves, and pack the roots in dry sand. There is no art in boiling it, except to boil it enough. Of course, the roots must be kept from frost and damp.

Books: *W H E.* Will you be so good as say of whose "Shrubbery and Flower Garden" you speak. There is no periodical devoted exclusively to hardy plants, nor is there likely to be, until the public taste becomes more scientific and less corrupt. People now-a-days care for little except colour, and disregard form, which is the only foundation of beauty.

Greenhouses: *A B.* A span roof is the best form; Hartley's rough plate is the best glass for the roof; you may use sheet or thick crown for the sides. Hot-water pipes will heat it. In Mackintosh's "Book of the Garden" are many excellent designs.

Gynerium argenteum: *K S.* Next week.

Heating: *W C.* There is no difficulty. If your three houses and pit are higher than the stoves, so much the better.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*H B.* 1, 2, 3, 4, 6, are different states of Aspidium (Lastræa) Filix-mas; the same and other forms are widely spread over the temperate regions of the earth. They have been described as distinct species by various authors, viz., 1. Aspidium Filix-mas, the common European form. 2. A. affine, C. Meyer, some parts of Europe—being the Filix-mas var. incisa of British writers. 3. Aspidium paleaceum, Sm.; A. patentissimum, Wall.; A. parallelogramma, Kunze; A. crinitum, Mart. et Galeot.; A. adnatum, Blume. Found in Mexico, Guatemala, New Grenada, Venezuela, Peru, Brazil, &c.; also Nepaul, Himalayas, and other parts of India; Ceylon, Java, &c. 4. A. rigidum, Sm., Europe and East Indies. 6. A. affine (Lowe), Madeira and South of Europe. 5. Polystichum lobatum—various states of this, as also P. aculeatum, are found common over the earth, from the most southern limit of the growth of Ferns, and in the tropics, to the extreme temperate latitudes of the north; the number of intermediate states quite set aside the characters used by British writers on Ferns for distinguishing P. aculeatum from P. lobatum. *S.*

Pines and Evergreens: *X Y Z* will thank some of our correspondents to inform him "which are the best kinds of Pines and evergreens for planting on a granite rock."

The Venetian Sumach: *A Sub.* This is perfectly hardy, but requires a warm light soil in which it may be able to ripen its wood. You cannot get the tar off your young plants; it is uncertain whether they will suffer from the application. Hares and rabbits cannot be kept off them by any other means than fences. If you do not fence you must kill your game, or allow it to kill your trees.

The Vinegar Plant: *Elia.* This is the spawn of a fungus called Penicillium glaucum. It thrives in a weak solution of sugar, which it soon turns to vinegar. You may cut the plant to pieces as often as you like. Every piece will grow.

Vine Borders: *Old Sub., &c.* Mr. Nash's border is constructed as follows:—The houses are built on the side of a low hill, with a gravelly bottom. On the surface of the natural ground, which was coated with concrete, the border has been formed 3½ feet deep at the back and 2½ feet deep in front, so that it slopes from back to front, where it is rounded off. No rain can ever lodge there. It was formed with burnt clay (the bottom of some old brick-kilns), loamy turf from an old pasture, plasterers' rubbish, hair and trimmings of hides (called fleshings) from the tan-yards, and an enormous quantity of thoroughly rotten stable manure. All these materials after being thrown together were *thoroughly incorporated.* They form so loose a bed that a stick may be easily pushed through it to the bottom. Every November these borders receive a good mulching of stable manure, which remains to rot in the succeeding summer, so that the surface is always covered by a rich decaying material which absorbs heat from the sun, and detains the natural dampness of the border. The Vines are managed upon Mr. Crawshay's plan.‡

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

HOSE PIPING.—GREAT REDUCTION IN PRICE.
PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 50 per cent., which advantage is offered to the public.
BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

WEEDS ON WALKS.
MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

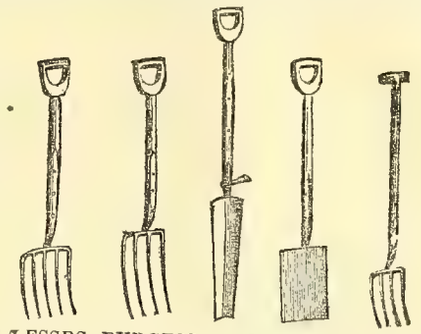
STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

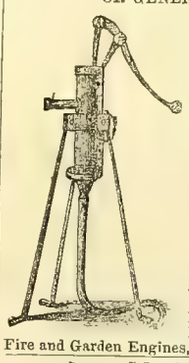
Diameter of Barrel, under nose.	Length of Barrel,		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2¼ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2¼ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.



The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

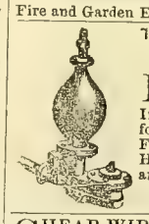
Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.



TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.
PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

CHEAP WIRE GAME & POULTRY NETTING, 5*d.* per running yard.
GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

	Galvanised.	Not Galvanised.
24 in. wide, 2 in. mesh,	7*d.* per yard.	5*d.* per yard
30 in. „ 2 in. „	9*d.* „	6½*d.* „
36 in. „ 2 in. „	10½*d.* „	7½*d.* „
48 in. „ 2 in. „	1*s.* 2*d.* „	10*d.* „

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown in the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. FOX, City of London Wire Works and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.

PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The first Session of 1855 will begin in February. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

JOHN MORREN, GENERAL COMMISSION AGENT, Ock Street, Abingdon, is open for Commissions for the sale of Agricultural Implements, Manures, Seeds, &c., and for the purchase of Corn, &c.

AGRICULTURAL TUITION.—A Gentleman, possessing 500 acres of Arable and Grazing Land, has a vacancy for a PUPIL. Terms, a premium of 80 guineas per annum.—Address J. P., Post-office, Peterborough.

The Agricultural Gazette.

SATURDAY, DECEMBER 30, 1854.

MEETINGS FOR THE ENSUING WEEK.
THURSDAY, Jan. 4—Agricultural Imp. Society of Ireland.

COVENEY'S ECONOMICAL MANURE.

A TON of COVENEY'S PATENT "ECONOMICAL" MANURE contains, according to Professor APJOHN'S report of its composition, about 4 cwt. of plaster of Paris, 4 cwt. of Glauber salts, nearly 8 cwt. of green vitriol, and 2½ cwt. of common salt, together with 1½ cwt. of other things, which include 30 lbs. of sulphate of ammonia. Of course these salts contain a large quantity of water—a mere useless addition to the weight of the mixture. The Glauber salts or sulphate of soda contains 55 per cent. its weight of water; the plaster of Paris, sulphate of lime, contains one quarter of its weight of water; and the green vitriol, sulphate of iron, 42 per cent. of water.

In the case examined by Dr. VOELCKER, this water amounted to more than 7 cwt. in every ton; the other ingredients in the dry state being—green vitriol nearly 5 cwt., bisulphates of potash and soda nearly 3 cwt., Glauber salts about 3 cwt., sulphate of ammonia about ½ cwt., together with 1½ cwt. of other things, chiefly sand. Excepting the absence of gypsum, and the greater quantity of ammonia present in the latter of these instances, they do not materially differ; the sulphuric acid, soda, and iron being in both the principal and characteristic ingredients. *And, in themselves, and as direct applications, three less useful additions to ordinary English soils it would be difficult to select.*

No wonder Mr. COVENEY has professed a disregard and even a suspicion of chemical analysis. It exposes his agricultural ignorance just as clearly as his commercial acuteness; for his sharp practice is combined with the clumsiest blundering in the history of the patent "economical" manure. A fertiliser to act quickly must consist mainly of nitrates or of ammoniacal salts, and if, in addition to these, it contain a due proportion of the phosphate of lime, it will be, like guano, lasting as well as rapid in its influence. Now, of these two principal fertilising agents Mr. COVENEY'S manure may be said to contain none, for the poorest farm dung is much richer in both. But of the things which it does contain a very large proportion are positively mischievous! The problem which its manufacturer has been puzzling over—How to make a manure for 8*l.* which shall sell for 12*l.*?—is happily insoluble in these days: and it is the facility of obtaining correct analyses which is the insuperable difficulty—if, however, we desired to compete with Mr. COVENEY

in the matter, we certainly should not lay in a stock of green vitriol to begin with.

The following is Professor Johnston's account of this substance :—

"Of the sulphates of iron which are known, there is only one —the common *green vitriol* of the shops—that occurs in the soil in any considerable quantity. There are few soils, perhaps, in which its presence may not be detected, though it is in bogs and marshy places that it is most generally and most abundantly met with. It is often exceedingly injurious to vegetation in such localities, but it is decomposed by quicklime, by chalk, and by all varieties of marl, and thus its noxious effects may in general be entirely prevented. To soils which abound in lime, it may even be applied with a beneficial effect.* When a solution of this salt is exposed to the air it speedily becomes covered with a pellicle of a yellow ochrey colour, which afterwards falls as a yellow sediment. This sediment consists of *per*-oxide of iron, containing a little sulphuric acid; but by the separation of this oxide the sulphuric acid is left in excess in the solution, which becomes sour, and still more injurious to vegetation than before. In boggy places the waters impregnated with iron are generally more or less in this acid state, and lime, chalk, and marl, with perfect drainage, are the only available means by which such lands can be sweetened and rendered fertile."

The object of the cultivator when this salt of iron is naturally present is to get rid of it as soon as possible. He drains the soil that it may be washed out of it, and that, by the continual passage of air, the mischievous material may be decomposed: he adds calcareous matters by which this decomposition may be hastened; and it is not till the iron is peroxidised and harmless, and it is not till the sulphuric acid is combined with lime, and also harmless, that he is satisfied; AND YET OF THIS SULPHATE OF IRON—THE CHARACTERISTIC NUISANCE OF MARSHY SOILS AND BOGGY INFERTILITY—ONE FOURTH TO ONE THIRD OF THE ECONOMICAL MANURE IS MADE!

How are we to account for such a blunder? Two causes may have operated—green vitriol will hasten, in the manner which Professor Johnston indicates, the reduction of vegetable fibre, and so facilitate the use of long manure or vegetable structures of any kind, while its sulphuric acid, both that which is combined with the iron, and that which is gradually being liberated from this combination by the action of the air, will unite with any ammoniacal products of this vegetable decomposition; and so it may have been considered useful, in both an active and a conservative capacity. The latter, indeed, of these qualities marked it out some years ago as one of the substances which were available as fixers of the ammonia wasted in the ordinary management of farmyard manure; so that it was recommended as a cheap and efficient addition to manure tanks, able to retain the volatile products of the fermentation proceeding there. Unfortunately for its character in this particular, however, it has the power not only of rendering ammonia non volatile, but also of rendering phosphoric acid insoluble; for while its sulphuric acid unites with the one, its oxide of iron is uniting with the other—and this was at once held to be so fatal to its use for such a purpose, that we believe it never received extensive trial. There was a little phosphoric acid in the sample of economic manure examined by Professor Apjohn, and it will accordingly be seen (p. 428) that along with peroxide of iron and sand it is enumerated as "insoluble in water."

This, then, is the character of green vitriol—generally mischievous; with its only good feature fairly neutralised: and yet this is the characteristic ingredient of the economical manure. The gypsum and the alkaline sulphates which are present have indeed proved agriculturally useful; the latter in particular instances, the former generally, when applied in quantity large enough; but no one with the smallest knowledge either of the wants of plants or the deficiencies of soils would think of making a manure for general application depend for its value on the presence of Glauber salts, nor would any intelligent person expect much from gypsum, except it were applied at the rate of many cwts. per acre. The whole affair is a blunder. And if, in spite of it, instances of its usefulness have been adduced, this only tallies with the ordinary run of agricultural experience; for there are records enough of extraordinary results in the field of which there has been no extraordinary cause apparent, to ensure that extraordinary success should sometimes follow the application of a manure, however worthless it may be, just as it sometimes follows absolute inaction.

How much worse than blundering Mr. Coveney's conduct of this business may have been we do not pretend to say. Our readers have now before them ample grounds of judgment upon that.

Our attention has been called to Boydell's Patent Wheels, or Endless Railway. It is plain that the efficiency of a railway over soft land for agricultural purposes depends upon the weight of the material to be carried on it being borne, and therefore sustained, by a large *flat* surface. In the ordinary carriage of that weight it is apt to sink beneath the surface, and so rendered difficult of conveyance—for wheels sink into the ground not only because they are narrow, but because they necessarily present a curved surface to the land. Now, Messrs. Boydell make their wheels carry, disposed along their circumference, a number of flat pattens as it were, which, as the wheel revolves, are placed, rolled over, and lifted successively, forming, in effect, what in the prospectus they are called—an endless railway. The apparatus is a sufficiently cumbrous looking thing, and to what extent it has yet been tried under circumstances capable of testing it, we do not know. Until some such test has been undergone, any opinion on the merely mechanical ingenuity of the contrivance is of little value.

We would gladly give insertion to the whole of the preface to the new edition of the "Word in Season to the Farmer,"* containing, as it does, matter referring to the treatment of clay, of no small importance to every cultivator of the soil. Our purpose in publishing that portion of it, for which alone we have room, is not to advocate, as for general and immediate adoption, the scheme which its author proposes, but, in accordance with the rule by which we have been guided in other instances, where authentic results in agriculture are borne out by sound principles, to give our readers an opportunity of judging of the merits of the case themselves. And this they will be the better able to do, for the full and valuable discussion of the whole subject which Professor Daubeny has given it in the lecture reported in our columns.

The author in his address to those who have tried this plan of growing Wheat and succeeded, refers first to the history of the 4-acre piece spoken of in pages 23, 24, and 25 of the pamphlet. He says :—

"The produce of the first year (1851) was 41 bushels; of the second (1852) 30 bushels; and of the third year (1853) only 26 bushels. There was no difficulty in accounting for the shorter crop in 1852, since the early sowing season was so hot and dry that the seed actually malted in the ground, and the field was re-sown with the only seed I could then readily procure, and that was faulty and crushed, and consequently yielded ill. But the degradation of 1853 demands some comment. For at harvest no one, I believe, out of the numbers who inspected it, gave an estimate of less than 40 bushels. The land, therefore, had produced the crop. But the season in reality had told on the grain; the yield partook in a degree of the general and unheard-of deficiency; and, though it still gave a very high average for the year, I was thus defeated of my hopes by a reduction to 3 quarters and 2 bushels."

The crop of the past harvest is estimated at 5 quarters per acre, and the confidence with which this is expected is justified by the character of the season, which ensures the realisation of grain-crop estimates. The soil of this 4-acre piece, it will be remembered, is not Wheat land, but a light gravelly loam, with a subsoil containing less of the loam and more of the gravel as it descends.

In order therefore to preserve the mineral wealth of the soil, which successive crops of Wheat are sure to diminish, a supply from without is needed, and the following describes the mode in which it is provided.

"At the corner of the field in question there is a narrow vein of clay, of fair quality; and here, in the autumn of 1853, I dug and raised a sufficient supply for my present purpose, and left it on the spot in ridges, to be acted on by the frost. Twice during the winter it was turned; and after that it was wheeled on to the intervals, between each triple row of growing Wheat, where it was most and soonest required, being those parts where the gravel abounded most; and during the summer it was well stirred in with the horse-hoe.

"In the winter of 1853-4 another lot of clay was raised, and turned at spring and during summer; and after harvest, and when the stubble had been pared and burnt, it was carted on to the land, and spread, and rolled, and harrowed in. There is now only a small portion of the field in want of such a dressing; and that will be treated in a similar way next season.

"The value of burnt clay is now well known, in a great degree through the well-digested experiments of Dr. Voelcker. Setting aside altogether the cases of pure pipe and porcelain clay, the great majority of clay soils contain every mineral element of fertility for the Wheat plant in abundance,—that abundance varying, of course, according to the quality of the clay itself. For when the analytical chemist speaks of mere traces of such and such a substance being found in a given soil, he is speaking of what he finds in the few ounces of earth under examination. But bring up even a superficial inch of subsoil from an acre of land, and those few ounces are increased to a hundred tons, when the slight traces will become deep footmarks. Increase by degrees the quantity to 10,—12,—18 inches, and there will be no fear then for that promised and lasting abundance.

"But clay, in its natural state and position, that is, as it lies unmoved and cohesive below the surface, does not yield up its hidden treasures, which remain almost wholly insoluble and all but inaccessible to the roots of the plant. Bring up the clay, then, to the surface. Apply to it the action of fire at the due temperature; and its condition is wholly changed. Its texture is altered, and it has become porous. It absorbs the organic substances of the atmosphere. Its dormant inorganic substances are awakened, and become gradually soluble. And if the heat has dissipated in some degree the organic substance ammonia, and rendered less soluble the inorganic phosphate, it has been proved abundantly that clay, properly burnt, is still chemically as well as mechanically of very great agricultural value.

"Improperly burnt, however,—that is, burnt beyond that due and proper temperature, the baked clay has lost its high value. The solubility of its mineral ingredients is greatly diminished. The ammonia has vanished altogether. It is less absorbent of that from the atmosphere; and the labour and expense of the process, in a great measure, are thrown away.

"I come back now to the practice I have been describing, of simply bringing up the clay and turning it, and exposing its surface to the action of the atmosphere. By this process all the good effects of burning are secured, and all the evil avoided. The clay becomes pulverised and porous, and in a condition to absorb and retain the atmospheric ammonia. Whatever ammonia already exists in the clay, remains; and a sufficiency of every inorganic element of fertility is rendered soluble and available for the wants of the growing plants.

"Such has been my process on land not naturally Wheat land; and there can be no doubt, I conceive, that the good effects of this single inexpensive dressing of clay will survive for several years. Comparatively inexpensive; for one spit deep will now suffice for the digging of the intervals; since the mineral substances being already on the surface, no double digging need search for them below."

As to the original experimental ground, which is strictly Wheat land, its 10th crop of Wheat is, we are informed, now coming up vigorously.

"The subsoil here is tenacious; so tenacious, indeed, that in forming my water-tight liquid-holding tanks I have but to dig and the feat is done. When, therefore, I have reminded the reader that heavy loams and clay subsoils,—those very soils which are the hardest and most expensive to work in the ordinary way,—are the soils expressly suited for the scheme I propose, I have nothing further to add under this head. For, it will be self-evident that what, in the case of the lighter soil, had to be conveyed to the intervals, is at hand here and under the spademan's feet; and that when this clay is brought to the surface before winter, it has a ten months' fallow at least, while a full crop of Wheat is growing at its side; it is a common fallow, in short, without the common accompaniment of a fallow,—the loss of a crop."

The preface concludes with a word to those who have tried the plan and not succeeded. We recommend them to procure the pamphlet and study the whole process in its principles and details, both of which are amply discussed.

LOIS-WEEDON:

A LECTURE ON THE REV. MR. SMITH'S SYSTEM OF GROWING WHEAT.

Delivered at Oxford by Dr. Daubeny, Sibthorpian Professor of Rural Economy.

(*Concluded from page* 828.)

The following may also be suggested as another possible source of the supply of nitrogen to plants. Schœnbein states that ozone, when brought into contact with nitrogen, an alkali, or an alkaline earth, being at the same time present, generates nitric acid, and he suggests this as the probable mode in which nitric acid is produced during natural as well as artificial electrical disturbances. Now, oxygen seems to be converted into ozone in every case of combustion, whether slow or rapid; and if by combustion, why not during that process of *eremacausis* which is taking place in all humus. Hence it is conceivable that exposure to air and light may enable a soil to supply plants with nitrogen, not only through the medium of the ammonia which it absorbs from the atmosphere, but likewise by means of the nitric acid which it causes to be generated owing to the ozone which its own *eremacausis* occasions. May not the difference of fertility in soils be in part connected with a difference in this supposed capacity?

In a former lecture* I stated my grounds for objecting to the facts alleged by Professor Johnston in favour of the direct absorption of nitrogen, but the discovery of ozone and its properties seems to place the question in rather a new light, and to render the supposition a more tenable one.

Accordingly it is not difficult to believe that, in so far as the organic constituents of the crop are concerned, no extraneous matters of an azotised nature in the shape of guano, stable dung, or nitrate of soda, may be required in this system of culture.

We come next to the inorganic constituents, and here the only one which need detain us is the phosphoric acid, for it is well known that all ordinary clays contain, locked up within their substance, sufficient alkali to supply any amount of produce. Now, assuming a bushel of Wheat to weigh 60 lbs., and 100,000 parts to contain 400 of phosphoric acid, then 34 bushels or

---

* We know of no agricultural experience to sanction this opinion of Professor Johnston; if, however, any advantage were derivable from the application of green vitriol to a calcareous soil, it would be owing to the rapid decomposition of this noxious salt, the formation of gypsum being, in such a case, one of the results of that decomposition.

* Thirteenth Edition. Ridgway, Piccadilly

* I showed, that in all the cases cited either the nitrogen or the oxygen were in a nascent state, but Schœnbein has justly observed that in the nascent state oxygen often exists as ozone.

2040 lbs. of Wheat will contain 8 lbs. of phosphoric acid. But an acre of ground from the surface to 1 foot in depth may be calculated as containing 1600 tons, consequently in order to yield phosphoric acid enough for a crop of the supposed magnitude, only $\frac{1}{363000}$ part of its amount would be required. In other words, if the soil contained only 3 grains of phosphoric acid to 1,000,000 grains of earth, it would supply enough for a single crop. *

Now it may be seen that the proportion of phosphoric acid present in soils varies from 3 parts in 20,000, which was the composition of the poorest subsoil in the neighbourhood of Brunswick, to 5, 19, and even as high as 60 and 120 ; the two latter figures representing that of rich soils in Moravia and in Belgium respectively. (Johnston, p. 414.)

Granting, however, the very lowest of these numbers to represent the composition of the Lois-Weedon clay, there would still be in the acre 435 lbs. of phosphoric acid, or enough for nearly 54 crops, and if the highest quantity, enough for more than 17,000 crops of the same magnitude. I believe that one part in 1000 is not an uncommon proportion, and this would give to the acre not less than 2900 lbs., or a sufficiency of phosphoric acid for 362 crops.

Consequently, provided means can be found for disengaging the whole of this quantity, it is quite conceivable that the soil might for a considerable time continue to yield large crops without the application of manure.

In summing up the advantages and disadvantages of the Lois-Weedon system, I think it may, in the first instance, be conceded, that we must not rush to a conclusion in favour of its applicability to land in general from its success in this individual instance. Before such a result can be arrived at with any kind of confidence, trials must be made on limestones and on granites as well as on clays and loams, and on light soils as well as on heavy ones. Until this has been done, it is impossible to predict in any particular case that a sufficient amount of ammonia can be absorbed by the soil through the mere process of pulverisation, to answer our purpose, and to provide materials for an abundant crop. Neither are we justified in assuming, that every kind of soil which we cultivate contains within itself a sufficient amount of phosphoric acid in that state of combination which allows it to become soluble and available for the purposes of plants.

I have in a former lecture alluded to the distinction between the dormant and active ingredients of plants.†

By the active I mean those which water impregnated with carbonic acid alone is capable of taking up ; by the dormant, those which resist the solvent action of this menstruum, but which may be extracted by muriatic acid. The former represents the portion which is at the time available, since carbonic acid and water are the means which Nature employs for introducing these materials into the organism of plants ; the latter represents what may be expected after a year or two of fallow to become available. But even after carbonic acid and muriatic acid have both acted, it is conceivable that a portion of these materials may remain, which might be extracted by a more elaborate process of fusion with barytes or lead, and subsequent digestion in the mineral acids ; and this, inasmuch as it will remain, for many years at least, inoperative upon the plants which grow in the soil, I have denominated the passive ingredients. I have shown that, by a series of successive croppings, I reduced the amount of active ingredients in the soil of the Botanic Garden, without much affecting that of the dormant ones, and hence have concluded that the farmer has often three courses open to him, namely—

1st. To apply a sufficient quantity of the same materials in a state in which they can be absorbed by the plants without delay. 2d. To allow the ground to remain fallow, by which expedient time is given for a further decomposition of its materials, and for a renewed extrication of its useful ingredients to take place. 3d. To produce, by the various methods in daily use, such a stirring and pulverisation of the ground, as may admit of a more thorough admission of air and moisture, and consequently accelerate the process of disintegration in a greater degree than would take place under natural circumstances.

The choice between the above three methods will, of course, be determined in each instance by a balance of economy ; and if the conditions are such in the case of Lois-Weedon as to make the balance incline in favour of the third method, which proceeds upon the principle of making the fullest use of the materials inherent in the soil without seeking for them elsewhere, and of accelerating those processes of decomposition by which Nature herself is ever evolving the latent resources which the earth contains, it must not be taken for granted that the same is the case everywhere.

But even assuming that we have land to operate upon as favourable for the experiment, in all respects, as that of Lois-Weedon, would it be wise to discard all assistance from manure, and to rely upon pulverisation and bringing up the subsoil alone ? It would be as foreign to the expressed views of the author, as it is to the carrying his principles into practice, that such a rule should be adopted.

Mr. Smith, indeed, having only about 20 acres under cultivation, possessed no live stock of any consequence, and therefore had no stable dung to spread upon his land. But it does not follow that a farmer whose concerns supplied him with abundance of this fertilising material would be wise in throwing it aside as superfluous or injurious. Even on Mr. Smith's farm, that portion of his land which consisted of gravelly loam would have been benefited by such an application, as it required the addition of some of the clay taken from another part of the estate to supply its deficiencies. It would be absurd, therefore, to reject that amount of azotised matter which has been already accumulated by the processes of agriculture, in reliance upon the powers of the soil to extract a fresh quantity from the atmosphere. It would be like the fisherman throwing into the water the remaining contents of his net after his meal was over, confident that his skill would enable him to catch a sufficiency for his subsistence on the morrow.

Manures, indeed, as I have remarked on a former occasion, contain the products which Nature has, with so large a consumption of time, and by such a number of complicated operations, elaborated from the raw material contained in the soil, and has at length brought into the condition in which they are most soluble, and therefore best fitted for assimilation by the organs of plants. To waste them is therefore to undo what has been expressly prepared for our use by a beautiful system of contrivances, and to place ourselves under the necessity of performing, by an expenditure of our own labour and capital, those very processes which Nature has already accomplished for us, without cost, by the aid of those animate or inanimate agents which she has ever at her disposal.

Nevertheless, with all these deductions, it must be admitted that Mr. Smith has conferred a benefit on agriculture, by proving that much of the money, which is now expended on guano and other extraneous manures, may be spared by that careful and complete subdivision of the soil which is so well carried out in the Lois-Weedon system.

He has also shown that there are certain soils in this country in which a much greater breadth of Wheat can be grown than is generally supposed, because instead of a five years' rotation, which would be equivalent to the setting apart one-fifth of the farm for Wheat, one-half may be profitably cultivated each year for that purpose.

But is not, it may be asked, the employment of spade husbandry a retrograde movement in agriculture. Can it be the case, that whilst all other trades advance by substituting machinery for the rude manual efforts which were originally employed, husbandry alone, in the most perfect state in which it has been yet brought, should return to that most simple condition in which it existed at the very earliest times, so that, after having advanced from the hoe to the plough, and from the plough to the other more refined machines which modern ingenuity has found out, it should at last appear, that the system of culture which can be performed with the simplest tools is after all the most advantageous.

To this it may be replied, that the comparison here instituted with the manufactures is not altogether a correct one. In these, machinery not only does its work with infinitely greater rapidity than manual labour, but at least equally well ; whereas in farming, the plough, although it may abridge the labour of preparing the soil for the seed, can never cause the same thorough stirring of it, which is effected by other and by simpler implements.

It may be sufficient, indeed, in land recently brought into cultivation, and therefore of exuberant fertility, to move the surface just enough to create furrows, in which the seed may be deposited, because the principles required for the nutrition of plants are abundantly present in a condition in which they are readily absorbed. But the case is different in land of only average fertility which has long been cropped. There it is necessary to bring the soil as completely as possible into communication with the atmosphere, in order, as we have seen, to elicit its latent treasures ; and in this case the additional labour of stirring it up with the fork and hoe, in the manner recommended by Mr. Smith, may be amply repaid by the results obtained. In short, the plough is the proper instrument for virgin soils, the spade and the fork for exhausted ones ; the former, although the invention of a more advanced period of husbandry than the latter, is in reality best suited for the earliest stages of cultivation—whilst these, although from their simplicity they are the implements that would occur to the first tillers of the land, are found to become more and more advantageous in proportion as the soil is worked out.

But, after all, may not these operations be facilitated by the employment of mechanical contrivances ; and may not we thus obtain the same result without so great an expenditure ?

To this, Mr. Smith's reply is in the negative, for he affirms that, for preparing the fallow for the next year's crop, there exists no implement at present but the spade or the fork.

This, of course, is a point on which it would not become me to speak with any degree of confidence ; but granting that the fact continues to be in times to come as Mr. Smith asserts it to be at present, namely, that the necessary pulverisation of the soil can only be effectually performed by manual labour, no inference can be drawn from thence against the use of machinery in general ; because the conclusion would be, not that manual labour is preferable to mechanical skill where they can be brought into competition, but only that a certain task requires to be performed to which machinery has not yet been found applicable, and for which therefore the labour of the hands of the peasantry must be devoted, not indeed as a matter of preference but of pure necessity. Such a circumstance, indeed, need not be a subject for condolence ; for, although it seldom is well to employ labourers where the end can be answered more economically by the use of machinery, still it may be regarded as a fortunate circumstance, that a larger proportion of the labour required for the profitable cultivation of our farms should fall upon our rural population, rather than upon those employed in manufactures at a distance from the spot where the results are to be obtained.

After all, however, the main impediment to the adoption of the Lois-Weedon system on a large scale consists, as I am informed, in the difficulty of obtaining an adequate amount of labourers to carry it out effectually.

Such at least is the statement made to me by a gentleman of this neighbourhood, who appears to have tried the plan himself, and also to have watched the working of the system in other hands than his own.

In a note which he has kindly communicated to me on the subject, he states as follows :—

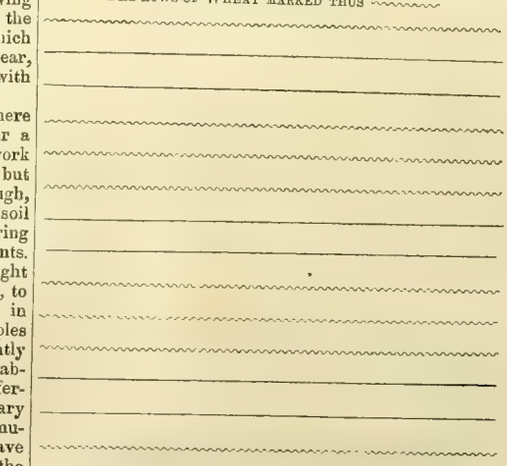
"Long Willenham, Abingdon, Nov. 9, 1854.

"My dear Sir,—I cultivated about half an acre of Wheat on Mr. Smith's system for three years; I gave it up because I found it inconvenient to bestow the necessary labour upon it at a time when the green or root crops required the most attention; and it it was for the same reason that Lord Essex, who began the system on a large scale, also gave it up. I believe that all Mr. Smith's statements are correct, and the experience of three years showed me that Wheat may be grown on the same ground without manure for a succession of years without any diminution of quantity. By the side of the crop on Mr. Smith's system, I grew Wheat three successive years, sowing it some broadcast, and some dibbled in rows, and a foot apart, over the whole ground. Last year I ploughed up the whole piece, and sowed it broadcast with Wheat. There was a very striking difference in favour of the part which had been under Mr. Smith's system, showing that the land had been less exhausted by it than where Wheat had been planted over the whole ground for the same period of three years. The yield of Wheat for the last two years—1852-3—was so bad that it was impossible to form a correct estimate of the value of the system on that score, but it is quite clear that there is an economy in manure. The difficulty of the labour question may perhaps be got over where the cultivation of other crops requiring attention at the same time is not carried on, and I believe that the expenses would be amply returned by the crop. I had a discussion as to the quantity of land cropped, or rather the quantity occupied by the three rows; I contended that three-fifths of the land was cropped, because space was left only for two additional rows. I send a diagram to explain my meaning, and I still adhere to the opinion that three-fifths are cropped. This, perhaps, is of little moment, but when I tried the experiment I was at first led into a mistake by Mr. Smith's book, first edition, and left the space for three rows instead of two. I have not tried the experiment on green or root crops, but I should be tempted to do so if I had not rather more land than I have as yet been able to bring into a high state of cultivation, having entered on it in a bad condition.—I am, dear Sir, yours faithfully,

"Dr. Daubeny. "James Clutterbuck."

Rows one foot apart.

The rows of Wheat marked thus



But after all, if the difficulty of obtaining labourers be the sole objection that can be brought against the practice, time alone is wanting to secure its general adoption. Private interest will in this case provide in the long run the means of accommodating the number of hands to the work required to be done, and after an interval the supply and the demand will adjust themselves in such a manner, that no more difficulty will be experienced in obtaining an increase of labourers for this species of rural labour, than is found in any other kind of manufacturing industry. Only let it not be supposed, that other methods of ameliorating the soil are to be superseded by the adoption of this one, or that the utmost skill in rendering available its latent resources ought to render us neglectful of those means and appliances which every large and well-conditioned farm has at its disposal, in the form of manure accumulated through the culture of preceding years, and containing the materials of fertility already in the very condition in which it is the aim of the husbandman to bring his soil by the laborious process of subdivision and of aeration noticed in this lecture.

* The following are the calculations upon which this result is arrived at:—An acre of ground to the depth of 1 foot contains 1600 tons of earth = 2,904,000 lbs. Now, 7 lbs. of phosphoric acid would be withdrawn from it by one crop of Wheat, amounting to 34 bushels, and this bears the proportion of 1 to 363,000 to the weight of the soil.

† Bakerian Lecture, Phil. Trans., 1845.

ITALIAN RYE-GRASS and LIQUID MANURE.

[The following is the letter from Mr. Telfer to Mr. Hamilton to which we alluded last week. We take it from the Journal of the Royal Agricultural Improvement Society of Ireland.]

"Cunning Park, 6th December, 1854.

"Dear Sir,—I observe from a report in the *Farmers' Gazette* of a meeting of the Royal Agricultural Society of Ireland, that in giving a description of my farm you have unintentionally allowed

some inaccuracies to occur, which have led you into most erroneous conclusions.

"There is one hydrant to every 2¼ acres, instead of every 6 acres, and the solid dung is wheeled out in a barrow, not put into the tanks. People would infer from your statement that besides the liquid of my cattle, the Italian Rye-grass had the solid dung as well applied to it, which is contrary to fact.

"You have also mistaken my autumn feeding for summer. The food raised on the farm for my cattle consists of Mangold, used during the first four months of the year, Italian Rye-grass during the succeeding six months, four months at four feeds per day, and two months at two feeds per day, and Cabbage during the remainder of the season.

"I was partly on Cabbage when you visited me in September, and in getting a description of the food then used, you have concluded that Cabbage was consumed during the whole summer, which makes an error of 150 feeds of 10 cwt., or 75 tons of Grass instead of Cabbage consumed by the cattle.

"In the extent of land under Grass and the quantity of manure applied, you are in still greater error.

"I have only 7 acres Italian Rye-grass, not 11, as you state; one-half of this 7 was sown this season, and was not ready for cutting till July. As soon as it was fit for use, I ceased manuring the other half, which, according to Dr. Kirkpatrick's experiment, is equivalent to stopping growth. I seeded and made hay of what remained on the ground, and afterwards prepared for an early spring cut by ploughing and sowing. There is now a fine braird on that half of the field.

"The conversion into Grass of the ammonia contained in the application of guano and the liquid of the cows was thus effected previous to July by the 3½ acres of last year's sowing. Since that time the conversion has been carried out by 3½ acres of this year's sowing.

"By referring to the statement of the feeding of my cattle you will find that during the four months I was on full feeding, 480 feeds of 10 cwt. each was consumed, and during the last two months on half feeding, 120 feeds—in all 600 feeds, less 6 taken from a perennial Rye-grass field not under irrigation. This gives 540 feeds = 270 tons Grass. Now in this calculation there is none of the Italian Rye-grass of the 3½ acres which was seeded and made into hay. I have, therefore, obtained 540 feeds of green food for 48 cattle, by which, taken at 2*d.* per cow, and this is 50 per cent. cheaper than any other food I can purchase, you have each feed worth 8*s.*, giving, of money value, 210*l.* from the application of a certain quantity of ammonia to either 3½ acres, 5¼, or 7, as you may prefer. The difference at the outside will merely be the rent of 3½ acres at 2*l.* = 7*l.*, which does not affect the calculation to any extent.

"If you take the land at 3½ acres you will have 77 tons Grass per acre, and 3½ acres is the maximum extent that I manured at any one time this season. This corresponds very closely with the results obtained from a portion of the field which I continued manuring, 82 tons 10 cwt. per acre being the weight of Grass taken off that part of the field in five cuts. Several of the weighings were made in presence of agricultural friends, and the Grass selected was considered by them a fair average of the crop as it stood.

"I regard this as a question not so much of land as of ammonia used on the land. Dr. Kirkpatrick's experiments show that with a weak solution of ammonia—liquid manure being well known to stand in that relation to guano as a source of ammonia—1 acre irrigated gave more than 10 acres without any application, 37 tons 6 cwt. 1 qr. 24 lbs. against 3 tons 10 cwt. I obtained similar results four years since, and that is the reason why I now apply such large quantities of guano or other concentrated sources of ammonia. I am astonished at your making the mistake of my having 11 acres Italian Rye-grass. To have given this quantity of land the liquid I mentioned in my letter to the *Mark Lane Express*, which you read, I would require to have had 110 cattle instead of 50.

"This is under the supposition that I used the whole liquid to my Rye-grass, which is not the case, the liquid of 10 cows being applied to the Cabbage crop, and five to the Mangold ground before sowing.

"A field of Italian Rye-grass does not vary as roots do. I have had such repeated weighings, almost daily, as enable me to speak with perfect confidence on the subject. The greatest uniformity can be obtained by a careful distribution of guano with the proper quantity of water to carry the ammonia immediately within reach of the roots of the plants. My root crops have received attention on this point, and I have succeeded in raising my average weight of mangold from 1½ to 8 lbs., but you cannot use your pipes with the same freedom in root crops as you can in Italian Rye-grass; besides, you have to contend against bad seed in root crops.

"In root crops I have hitherto been able to carry my applications of guano successfully only to the extent of 8 cwt. per acre. In Italian Rye-grass, from having more frequent opportunities of applying guano efficiently, I have now the length of 25 cwt. per acre, with profit.—Yours, faithfully, "A. B. Telfer."

Home Correspondence.

Italian Rye-grass.—Having seen in your Paper several accounts of Italian Rye-grass and its prolific amount questioned, I beg to send you the subjoined account of the results on my farm of 2 acres of light land joining the town. We carefully weighed and measured a rod of each cutting of the Grass, and found the weight to be as follows:—15 stones, 16 stones, 12 stones, 8 stones, 7 stones, 7 stones, making a total of 65, and as a stone a rod is equal to a ton an acre, this would be 65 tons of Grass to the acre. To ascertain the quantity this would probably give in hay, I had the curiosity to have 10 lbs. weight of Grass kiln-dried on the 4th of December, and the result was that in two or three experiments we found that 10 lbs. were dried down to 2¼ lbs., and that it made a sweet smelling hay that horses ate with avidity. Now, supposing the whole crop of Grass were made into hay; if 10 lbs. of Grass gives 2¼ lbs. of hay 65 tons of Grass will give 14½ tons of hay. It has been said that Mr. Telfer has grown 20 tons of hay to the acre; now if it be true that he has grown 90 tons of Grass, which I believe quite possible, it is true to say he had grown 20 tons of hay to the acre, on the principle that hay shrinks in drying from 10 to 2¼ lbs. The length of the cuttings during the year being put together is 19 feet 2 inches; this is the result of the best part of each crop. We were careful, also, in taking an average of each crop, and the result we found to be in weight 49 tons, and the length 11 feet 6 inches. The mode of farming we imagine not to be so high as Mr. Telfer's; about a barrel of water to the rod was pumped by horse power on the land after each cutting. The water was impregnated with the sewage water of a few houses and stables of about 15 horses, and the waste water from a brewery. The quality of the sewage water thus put on the land is generally believed not to be either so strong or effective as that obtained in farms like Mr. Telfer's. If Mr. Telfer has not already grown 20 tons of hay to the acre I think it is quite possible that he may, and by farming a little higher I don't know but I shall do it myself. *Arthur Morse, Swaffham, Dec.* 26. [It is probable that you dried your Grass more perfectly than Nature does in the hay-making process.]

Value of Land.—Referring to the editorial note on my communication on "Farm Buildings," I should explain that I was treating of outlay on the land solely in a commercial point of view. My assertion certainly appeared to involve an anomaly. The true explanation I believe to be that, of old, land was not viewed in a commercial light. A man acquired land either as owner or tenant as a means of livelihood. He gave little or nothing for it in money, either in way of purchase or as rent. He exhausted his means and his labour upon it for his convenience and enjoyment, without regard to a money percentage. Since land has become the frequent subject of sale, its price has depended not upon the original cost (estimated in money) of reclaiming it and of erecting the buildings upon it, but in ordinary cases upon the annual rent it will bring in its actual circumstances. But though it passes into each new proprietor's hands upon such a calculation, yet, when once in his possession, the common course is to maintain or improve the farm as far as the proprietor's means permit, without any nice calculation. I am satisfied that the more the subject is investigated the more apparent it will be that generation after generation has sunk money unreproductively in the land; and that much land at its present rent does not return common interest on the capital represented by the buildings, roads, enclosures, &c., upon it. *Alex. Hall Hall.*

Pedigrees of Short Horns.—A "Member of the Royal Agricultural Improvement Society of Ireland" is somewhat too captious in his remarks on the "Matchem cow." To all intents "she was almost without a pedigree," and the "Member" brings nothing but conjecture to refute the statements of the *Agricultural Gazette*. It is very probable that the bull "Farmer" was descended from good cows, but there is no proof of this, and it is in reference to written proofs that any pedigree can be called perfect or imperfect. Nothing is more certain, then, that "Cleveland Lad" did not injure Mr. Bates' herd, even if it be impossible to demonstrate that he improved it. The "Member" utters a truism when he states that "crossing injudiciously has been the ruin of half the herds in England;" but did judicious crossing injure Charles Colling's Teeswater breed? Did not the Galloway blood lay the foundation of these beautiful herds, which adorned and adorn the estates of the Dukes, the Bates, the Tanquerays, and the Booths of the present generation? The error of breeders in the present day is not that to which the "Member" refers—the hazard likely to be incurred is not that of crossing, but that of selecting animals for breeding stock, because of their colour and their pedigree only, rather than because of more important qualities upon which their excellence as breeding stock must depend. Few breeders have maintained their reputation through a long series of years, because they have not sufficiently studied the principles upon which success is dependent. There are, it is true, many anomalies in this, as in all vital functions; yet, as in other functions, enough is known to serve as a practical guide, and which, in the great majority of instances, will be crowned with success. Charles Colling with short-horns, and Bakewell with long-horns, were successful, because they were not the blind adherents of a system, but could perceive defects, and had the genius to discover the means of their removal. "Crossing," "breeding in and in," and other "bugbears" were disregarded by them when they had an object to achieve, and thus the "Teeswater" heifer was inoculated with "Galloway" blood, and the qualities of "Favourite" were permitted to blend and remingle with his near relations. Deformity to the herd, and ruin to its owner would most assuredly follow, if "crossings" were recklessly pursued; but the skilful breeder can detect the time and the agents when and by which such a process may be tolerated. It is a popular belief among breeders, that a well-bred, although misshapen animal, will produce a better offspring than a good shaped one without a pedigree; this is a dangerous fallacy, first, because as a rule "like begets like;" and next, the good shape may be the representative of a long line of unnamed beauties, and like "Hubback," and "Farmer" of old, become the sire of priceless offspring. Certain animals have special and dominant qualities which they impart to their progeny with such vital force, that they ooze out through many generations: in one the reproductive, in another the assimilative functions predominate, and he only is entitled to rank as a "breeder" of animals who has the intuition to recognise, and the experience to apprehend the qualities, which are most required for maintaining his herd at the standard of excellence. *J. H., Mickleover.*

Thin Seeding.—Your correspondent, "T., Gloucester," asks, Nov. 22, "do Messrs. Hardy mean to say that 6 pints of seed are all they would advise to an acre? The thing is so ridiculous that it is hardly worth refuting; game, rooks, larks, and slugs, to say nothing of wireworms, would make such havoc with the plant, from its very thinness, that the poor farmer would be very fortunate to reap as much as 2 quarters, 2 bushels, 3 pecks, and 5 quarts per acre," &c. Now, although I am no farmer, it struck me on reading the above that, if it could be shown that 6 pints of seed to an acre, or even a smaller quantity would be sufficient, it would be conferring a real benefit upon the community at large, and would be an immeasurable relief to the editorial apprehension recorded in your paper of the 2d inst., "That task the powers of cultivation and of the soil as we may, we are likely to be wholly unable to keep up with the demands made upon them by our rapidly increasing population." And since I have no experience of my own, I transcribe an account of an experiment made 88 years since, which I presume will be very consolatory to "T.," and to all who, like him, apprehend diminished produce from thin seeding:—"On the 2d of June, 1766, Mr. C. Miller, of Cambridge, sowed some grains of the common red Wheat, and on the 8th of August a single plant was taken up and separated into 18 parts, and each planted separately; these plants having pushed out several side shoots, about the middle of September some of them were taken up and divided; and the rest between that time and October. This second division produced 67 plants. These plants remained throughout the winter; and another division of them, made between the middle of March and the 12th of April, produced 500 plants. They were divided no further, but permitted to remain in the field. These plants were in general stronger than any of the Wheat in the field. Some of them produced upwards of 100 ears from a single root; and many of the ears measured 7 inches in length, and contained between 60 and 70 grains. The whole number of ears produced from the single plant was 21,109, which yielded 3 pecks and 3 quarters of clear corn, weighing 47 lbs. 7 oz., and, from a calculation made by counting the grains in an ounce, the whole number of grains was about 576,840. Mr. Miller thinks that, had he made a second division in the spring, the number of plants would have amounted to 2000." Now, supposing the plants at their final planting to be placed 6 inches apart in the rows, and 1 foot from row to row, we shall find 28 plants to a square yard, and the 500 plants occupying a space of $17\frac{6}{7}$ square yards, and the number of grains necessary for the cultivation of an acre (supposing each grain to yield an equal number of plants) to be $271\frac{1}{12\frac{6}{7}}$; and this mere fraction of a pint of seed yielding, not 2 quarters, 2 bushels, 3 pecks, and 5 quarts, nor yet upwards of 19 quarters of Messrs. Hardy's computation, but 31 quarters, 6 bushels, 1 peck, 1 gallon, and all this without any casualties arising from the mischievous propensities "of game, rooks, larks, and slugs," for the final planting being so late, as, at a medium, the beginning of April into well prepared ground, they would take root at once, and progress rapidly with the season. The mode detailed in the above quotation would of course involve considerable labour and attention, but the extra expense of labour, &c., would be more than compensated by the very great saving effected in the seed. The foregoing quotation is taken from the exposition of the parable of the sower in St. Matthew's Gospel, by the Rev. Dr. Adam Clarke, and is quoted by him as a proof of the goodness of the Creator in the amazing fecundity of nature. I trust the above may meet the eye of some one or more to whom it may be useful. *William Chitty, Stamford Hill.* [The use made of this experiment by Dr. Adam Clarke is perfectly right and reasonable; but your use of it for the advocacy of thin seeding is extravagant if not illogical.]

Farmers' Clubs.

Cirencester, *Dec.* 2.—At the annual meeting of this Society Mr. Lawrence and Dr. Voelcker delivered addresses from which we extract the following passages:—

Deep and Shallow Tillage.—Mr. Lawrence referred to this subject because a farmer, at a previous meeting, had advocated shallow tillage; a man of considerable experience too, whose opinion was likely to secure attention. He said:—

I am quite alive to the folly of attempting to lay down any system of tillage as of universal application. There are, however, certain principles with which we should be familiar, before we can safely determine our practice in any particular case. The first question would seem to be, what are the essential agents to vegetable life and nutrition? The second, by what means is the action of these most effectually and economically secured? The successful growth of all our crops is dependent on the due supply of each of two classes of elements; the one distinguished as organic, the other as inorganic. Professor Liebig at one time taught that inorganic or mineral matter alone was essential to vegetable growth, and that organic matters were non-essential. In other words, that with inorganic matter alone we could raise our crops, and in the absence of it we could not. That a combination of both organic and inorganic elements is essential to the greatest produce has, however, been well established. Ammonia and carbon exemplify organic, and the phosphates and alkalies exemplify the inorganic elements. Ammonia is believed to be derived by plants chiefly from the atmosphere, but in part from the decomposition of animal substances by the free admission of air. Now, by what means is the action of those agents most effectually and economically to be secured? You must divest your minds for our present purpose of the popular notion—that earth, strictly speaking, is the source of vegetable nutrition; for the earth, apart from the elements we have been considering, is an inert mass, into which the roots of vegetables spread themselves in search of their respective foods—the means by which they are retained in their after growth in an erect position, spreading out their foliage to those atmospheric influences, on which their successful maturity greatly depends. Plants draw from the soil such nourishment as they derive from that source by the minute mouths at the end of their delicate roots, and from the air by means of the absorbent vessels contained in their leaves. You will readily understand, therefore, that such minute organs cannot take up anything in a solid state. They can only absorb nourishment in the state of fluid or gas. If the soil were deprived of the access of water and air, it would be utterly unproductive, though full of the sources of nutrition. Our time does not admit of any minute description of the mode in which these elements are severally rendered available to plants. It is sufficient for our present purpose to know, that the soil is the medium of communication; and therefore it is essential that every portion of it into which the roots extend should be rendered easily accessible to the natural solvents, air and water. The moisture in the atmosphere absorbs the ammonia floating in it, and rain brings this down to the earth. Water and air accelerate decomposition, both of the animal and vegetable substances applied to the soil;

this decomposition produces a further supply of ammonia, carbonic acid gas, and warmth. Carbonic acid renders soluble many inorganic or mineral elements, which by that agency alone are assimilable by plants. Some portion of these mineral elements are being continually absorbed, and carried off our land in the shape of corn, beef, mutton, &c. The subsoil is in most cases the almost inexhaustible bank of deposit of this mineral matter, on which we can most readily and successfully draw. It is by loosening this, and exposing every particle of it to the action of the atmosphere, that the requisite supply of mineral matter is rendered gradually available. It is simply on this principle that fallowing depends. When land has been to a certain extent exhausted of its available mineral elements required by a crop of Wheat, by free exposure to the atmosphere for a time, a further supply is rendered soluble and available for the succeeding crop. The popular notion is, that fallowing is resorted to merely for the purpose of destroying couch and other weeds—a very useful accident of fallowing—but the other is the more important result. Deep tillage, then, is the means by which the air is freely admitted to the subsoil, where it promotes the decomposition of organic matters, and the production and absorption of ammonia, and with the aid of water, it also renders soluble the mineral matters contained in it for the use of future crops. A further result is, an increased temperature of the subsoil, by the free admission of air and water, which you all know greatly promotes vegetation. Our forefathers were at some pains to facilitate the escape of rain from the surface of the soil, which science teaches us to welcome as a very important fertiliser, and to afford a free passage through it. Mons. Balard, a French chemist, has demonstrated by experiments that where about 25 inches of rain fall in the course of a year (which is under the average of this district), that which falls on an acre of land contains, and conveys to the soil, fertilising matter equivalent to the quantity of ammonia contained in 2 cwt. of Peruvian guano, with the addition of 150 lbs. of nitrogenous matter of a highly fertilising character; nearly all of which the late experiments of Professor Way prove is absorbed in the passage of the rain through an adequate depth of soil. The experiments of Mons. Balard have been repeated, and the results have been confirmed by Dumas, Boussingault, and other well-known chemists. The same influences which have rendered our surface soil productive will produce the same effect on our subsoils if freely admitted. Subsoils of sand, and of some gravels, are exceptional cases, but in nearly all clays and in all subsoils of an aluminous or tenacious character, and into which we know the roots of our crops will extend themselves in search of food, common sense would seem to point out the advantage of adopting those means by which that food can be most readily supplied. I am no advocate for radical reform, and turning matters upside down, and bringing the subsoil to the surface; but merely that it should be loosened by the common subsoil plough, and rendered accessible to atmospheric influences, and thus gradually prepared for vegetable nutrition. When so prepared, the ordinary plough may be set from time to time a little deeper, and the subsoil be thus gradually incorporated with the surface-soil. There is hardly a parish in the kingdom in which a practical demonstration cannot be found of the advantage of deep tillage, and in which land become comparatively unproductive after long shallow ploughing, has not become productive enough under the fork and spade of the gardening labourer, who has no other aid to give it. I wish to be clearly understood as not recommending deep ploughing on all occasions; for instance, not Clover lea for the Wheat crop, nor to follow the sheep-fold by a deep furrow for the Barley crop, &c.; but that in the course of the shift, whether the 3, 4, or 5 years' course, deep tillage for the root crop should be the rule with very few exceptions.

The Chairman proposed "The Royal Agricultural College." Mr. Holland facetiously referred to a conversation which he had had with Lord Gifford, in which his lordship had expressed a favourable opinion of the College, Dr. Voelcker having kindly analysed the contents of a fox's stomach which he thought had been poisoned. (Cheers and laughter.) Dr. Voelcker, in the absence of the principal, the Rev. J. S. Haygarth, in returning thanks, said :—

In my intercourse with farmers I have never encountered any difficulty with a thoroughly practical man, but have often been involved in endless discussions with the inexperienced who, whilst deficient in practice, possessed only a smattering of science. True science and sound practice will always be found to harmonise with each other; both are founded on experience, and experience is acquired only by constant observation. The study of science sharpens the powers of observation, and must be therefore attended with considerable benefit to the practical man, who but too often neglects the aid which science does afford. I have seldom paid a visit to any of my agricultural friends without becoming acquainted with something worth remembering, and have met often with something worthy of imitation. Thus for instance, the admirable way in which Mr. Lawrence manufactures and preserves his manure from sustaining any loss, is well worthy to be imitated by all who follow the system of box feeding. The layer of clay and road scrapings, with which Mr. Lawrence covers his manure heaps, preserves most effectually, and at the least expense, all the volatile fertilising constituents which it is so important to retain in manure heaps, and at the same time shuts out to a great extent rain and air, the combined influence of which causes the deterioration of well made dung. The subject for discussion moved by Mr. Lawrence reminds me to notice the excellent manner in which my neighbour, Mr. Benjamin Whiting, has lately cleaned and prepared for Turnips a very foul field, on which Wheat was grown this year. Mr. Whiting ploughed it deep, and then sent a scarifier through it. The remains of the Wheat crop and the long spreading roots of couch, were brought to the surface and carefully raked together. This vegetable matter afforded abundant fuel for burning the soil, a practice of which Mr. Whiting took advantage by the dry autumn weather. In this way, not only the land was thoroughly cleaned from the nasty couch and other weeds, but also a most useful manure for the Turnip crop,—burnt clay and ashes—was obtained in great quantity, whilst the advantages of deep culture were secured at the same time. There can be little doubt that deep ploughing is not practised as much as it ought to be, and I fully agree with Mr. Lawrence that the benefits resulting from deep culture cannot be too highly estimated. Frequently renewed contact with the air greatly facilitates the decomposition of the organic matters in soils, which decomposition is so necessary before they can afford food to the growing plant; but the action of the air on the inorganic soil constituents is still more important. It is well known that plants cannot assimilate any solid matters, and that consequently those constituents which are found in the ashes of plants must be presented to their roots in a soluble state. Many soils, especially clay soils of the better description, may be said to contain inexhaustible supplies of inorganic fertilising constituents, which only require to be brought into active service,—rendered soluble in order to act most beneficially in increasing the produce of the land. It is evident, therefore, that deep ploughing, which has the effect of exposing fresh quantities of soil to the decomposing action of the atmosphere, must be attended with considerable benefits. Another, but less important result of deep culture, is the finely powdered condition in which the soil is obtained. The increased porosity enables it to absorb more abundantly the highly useful ammonia and other fertilising gases existing in the atmosphere, and thus organic food will be incorporated into the soil more abundantly by this practice, whilst it is found to yield its inorganic fertilising constituents for the benefit of the growing crops. A great deal, however, must depend upon the composition of the soil, for it is clear that no amount of ploughing, stirring, or grubbing, can develop any fertilising properties if the elements of fertility are not present in the soil. In clay soils, deep culture is so pre-eminently successful, because such soils contain inexhaustible supplies of all the inorganic matters required as food for plants, which are rendered valuable by coming into more frequent and more perfect contact with the air, and because such stiff and heavy soils, more than any other, require to be rendered more porous. But in purely silicious land, deep ploughing cannot possibly be attended with any benefit, since it is too porous already, and does not contain any constituents which, on contact with air, are rendered more soluble. On the whole, deep culture will be found the more successful in its results the more the land resembles, in composition and mechanical condition, heavy clay land, and its advantages will be less perceptible the more it approaches purely sandy soils. I ought to mention, however, that even in sandy soils sub-soil ploughing was found occasionally useful, and the reason is that some sandy soils rest on an impervious clay sub-soil, which does not allow a free circulation of air through the mass of the soil, in consequence of which the surface water becomes stagnant, and the decomposition of the roots and other remains of former crops is retarded to such an extent, that instead of the final products of decomposition, namely, carbonic acid, ammonia and soluble inorganic substances, an imperfectly charred substance, sour humus, is produced. It is well known that sour humus acts injuriously on vegetation, and care should be taken therefore to prevent its formation. Sub-soil ploughing, by admitting free access of air, most effectually does this, and next to thorough drainage is perhaps one of the most efficient means of bringing land into a high state of cultivation. Like so many practices, however, sub-soil ploughing requires to be carried out with judgment, for if the surface soil is but thin and poor, and a large mass of the sub-soil is brought up, which often requires many years exposure to the air before it can yield anything, the thin surface soil is completely buried by the unprepared subsoil.

Notices of Books.

Talpa, or the Chronicles of a Clay Farm. 3d edition. Reeves & Co.

We mention with pleasure the issue of a third and cheap edition of this admirable little treatise of the principles, and history of the practice, of agriculture.

Excepting one or two verbal alterations, and the introduction of a foot-note, the present edition does not, so far as we have noticed, differ from those previously published. The foot-note, however, is important as furnishing the striking illustration, given in the circumstances of Mr. Justice Talfourd's death, of that portion of the text with which it is connected. Mr. Hoskyns is there lamenting "the hateful chasm that lies too broad and forbidding between employer and employed in civilised England." And we all know how the last words spoken by the judge were in accordance with this sentiment,—how much of the crime with which in the mineral districts of Staffordshire he had to deal, he attributed to that "separation between class and class which is the present curse of British society."

Miscellaneous.

Chinese Economy of Manure.—My first excursion was to a place called Gading, 13 miles from Malacca, where I had permission to reside in a house occupied by some Chinese Christians who are cultivating a Gambir and Pepper plantation. The house was a mere huge shed. I lived in it a fortnight, as, strange to relate, the Chinese (I trust because they were Christians) kept it clean. No people in the tropics really cultivate the soil as these do. They do not merely plant and reap. They dig, and trench, and level; they eradicate weeds and stumps; they keep the ground clean, and they manure. The process of manuring, indeed, was the only thing I objected to, as the tank was a large bucket kept standing for convenience in a corner of the house. The rage for liquid manure is such, that in the Chinese villages a bucket often stands near the door for public use. The pigs for the same reason are far better lodged than with us, having a floor of poles with a tank beneath, in which all the manure is collected. *From a Correspondent of the Literary Gazette.*

The Incoming Tenant.—The incoming as well as the outgoing tenant has rights of which he ought not to be deprived, as well as duties which he ought to perform, to himself and family, to his landlord, and to the community in which he dwells. But a few years ago, when offers for farms were far too numerous and competition too high, the rights of the outgoing tenant were most looked after, and towards the preservation of these, tenant-right societies lent their aid in rather a clamorous manner. Now, however, emigration has lessened home competition for land; and though sufficiency of competitors for a good farm may still be expected, we seem to be nearer the time looked forward to by some, when, instead of a tenant looking out for a good landlord, a landlord will have to seek after a good tenant. This state of affairs induces incoming tenants to hold more firmly by their rights than they were formerly in a position for doing; and it is well that it is so, since it is by a fair and equitable commencement that a lease can tend to the advantage of either the granter or the holder. The system of leases has many merits over the tenancy-at-will mode; but it has also its attendant evils when, as sometimes happens, an outgoing tenant finds himself compelled to scourge or run out the land at the end of his lease, or else fail in getting himself remunerated for money that he may have expended in permanent improvements. While we would protest against ever giving an incoming tenant a copy of his predecessor's lease, a practice which sometimes leads to evil results when the new tenant finds himself in the position of a pursuer at law for previous miscropping, we would, at the same time, advocate the justice of not allowing him to suffer from the exhausted state in which he receives the farm. Let the landlord alone deal with the outgoing tenant in regard to rotations of cropping; and if the landlord cannot re-let his farm in a state of fair culture, let him drain and manure it sufficiently at the outset of the new lease, or give the new tenant money to do so; and by this means he may receive a higher rent, while the incoming tenant will not be "thrown on his beam ends" at the very outset of his lease by having to lay out his capital on renovating or draining the soil, leaving an insufficient sum at his disposal for carrying on the yearly routine of the farm with profit to himself. But where is the landlord to get the money, if his estate be burdened by mortgage or entail, or the payment of annuities to relations? Ten years ago the question might have been answered dubiously; and even now it is difficult to obtain money for such purposes in the ordinary way in which merchants obtain it for carrying on their system of rapid sales and speedy profits. But it has now been proved by experience that the plan of borrowing money at redeeming interest, either from Government or from a joint stock association, is well fitted for the special wants of agriculture, providing as it does for the redemption of the whole debt after a certain number of years by paying large interest in the meantime. This is a mode of getting clear of debt peculiarly well suited for agricultural improvements. The six per cent. of interest is paid in those years in which the advantage of the improvements is experienced, and there is nothing left to pay at a future time, when the drains and buildings, and other improvements, have begun to lose their value because of tear and wear. It has been reasonably objected to the present entail laws that they are inefficient for carrying out their principal object, namely, the descent of the patrimonial inheritance undiminished in value, and this because they make no adequate provision for the tear and wear of the subject. From want of adopting the plan of borrowing money for permanent improvements on redeeming interest, and from refraining from the investing that capital in the soil which an improved system of agriculture requires, many landlords have allowed their estates to fall behind in the progress of improvement; or the absence of the capital which they should have expended has been the means of crippling the exertions of the incoming tenant; or, supposing him able enough to carry on a system of good farming, has forced him, for the sake of his family, to take back his expended capital at the end of his lease by running out his farm. And then the next tenant gets the farm, as he got it, in an inferior state of culture, and the same story has to be told over again. *Perth Courier.*

Jenning's Process for Improving Quality of Flax. Fibre.—The process is very simple, and consists in throwing down upon the Flax a small quantity of oil, say about half an ounce to the pound of Flax; this is done by boiling the Flax in an alkaline soap ley, washing with water, and then boiling it in water slightly acidulated with some acid, for which purpose acetic acid is, perhaps, the most suitable, from its exerting no injurious action upon vegetable fibre. The acid decomposes the soap, the fatty constituent of which is left in the fibre, or, perhaps, a mixture of an acid soap and a small portion of free oil. These enter into and through every part of the fibre. After this treatment it is washed, and is then found to be soft and silky, its spinning quality being thereby much improved, and its value being very considerably increased; and, whilst the fibre is not weakened, this process gives to it what is known in the trade as "nature." The improvement in quality may be estimated at from 8*l.* to 10*l.* per ton, and is capable of being made, with ease, probably double. *Dublin Journal of Industrial Progress.*

Calendar of Operations.

DECEMBER.

Border of the Fens, *Dec.* 20.—December must ever be an unsettled month in England for field operations; alternations of rain and frost, wind and snow, make all directions by the farmer to his men conditional or provisional; two or three sharp frosts stop ploughing, but are favourable for manure carting, and well would it be if surveyors of highways could restrict some people from ruinous wearing of roads during wet, as we were lately annoyed by either thoughtlessness or love of mischief, in a large charge-bearer running half-a-dozen carts during the whole of a rainy week, two miles on a parish road, making it like a quagmire. Earth carting is another employment during frost, where dykes have been cleaned, burning the grassy fibrous parts, and mixing salt with the heavier portion in a large heap, with the addition of 1-10th or 1-20th part of gas-lime. Gas-lime is said to keep away or to kill wire-worms; it is certainly a useful ingredient for fen-land. When rain is prevalent, at every interval we direct the litter and dirt accruing in and about the homestead on the roadways and open spaces to be collected and stowed away ready to top the heaps of manure when carted from sheds and crew-yards; the occasional showers we have lately had have an excellent effect, let wise men say what they will. We do not observe any liquor to exude from the sides of such heap, but a rapid fermentation ensues, and if a good coating of the aforesaid collection of road scrapings are thrown over it, a solid mass of rich manure is the result. There is an evidently increasing disposition to obtain manure, and genuine guano is in high favour, its portability on heavy lands being a great recommendation; nitrate of soda also, not being much liable to adulteration, has also several advocates, but the nondescript and beggarly mixtures trumpeted by quacks are regarded with dislike and suspicion by nearly all our bustling and intelligent neighbours. We have not as yet made much progress in black draughts and drenching mixtures, one tank being only available to moisten and impregnate heaps of "farmyard manure" with their strong ammoniacal contents; our progress, therefore, in these mysteries is not rapid, but it is highly encouraging, stiff stubbles, and a full average weight of "green" crops approve the practice, and convince us that a careful preservation of the ordinary proceeds of any farmyard, with the addition of a few genuine, and some of the cheap and common manures, as chalk, salt, town soil, or gypsum, will in most cases suffice to maintain fertility, and so far diminish the chances of failure at harvest day. Every December finds jobs for the carpenter, sheds to be altered, yards enlarged, new ones made, repairs of gates, sheep trays, carts, &c., posts and rails about fences require renewing, and the short days seem only to prolong the work instead of seeing it completed, much time is also consumed in attending to stock; what with cutting Turnips, littering yards, cutting chaff, breaking cake, and measuring corn, the days are gone before any one is aware of it; lamps and candles cannot be dispensed with by

horsekeepers, but they are of no use to drainers, or gravel diggers, or hedgers, and tallow, "like everything else," as they say, is very expensive. It is always a matter of rejoicing with us to get the turn of the shortest day, and no good labourer is sorry when he no longer has to trudge home in "the dark," or in the dark grope his way to his task, from 6 to 6; the cheerful daylight has also more warmth and less wet, and with the old far more than the young; the glad fields and jocund woods sing to him with joyfulness, when the winter is past, and the spring is at hand, with dry garments to work in, and light enough to see his way home. *J. W., Peterborough.*

Farm near Chelmsford, *Dec.* 25.—The work requisite to the field cultivation of this farm is brought to a close, with the exception of drilling a few acres of Turnip land with Wheat. The season has been so propitious that nearly every department of the usual spring processes is anticipated. Winter Beans and hog Peas are sown; the former above ground and looking well; the latter beneath the surface have vegetated, and are, therefore, considered safe from the effects of frost. A larger breadth of Wheat than ordinary has been drilled, a moiety of which is up and looking extremely well, nor do we anticipate that any deficiency of plant whatever will ensue, and the same observation applies also to the entire county; but from the fine tillage many pieces are foul with seedling Grasses and weeds; for ourselves we are glad to state we are free. The seedling plants of black Grass (Agrostis stolonifera) are a pest upon the heavy land districts of this county, and the Wheat sowing is usually deferred until the middle of November to counteract the evil, thus frequently endangering a plant by late sowing. The fallows for the root crops of next summer are duly prepared and in excellent condition; a moiety is sown with early broad-leaf Rye for foddering in April and May, and it is then cut into chaff with straw until sufficiently advanced in growth to be used alone for that purpose. The yield is from 4 to 10 tons per acre, and affords excellent keep for cart and nag horses for six weeks. The yield of both Mangold Wurzel and Swede Turnips is this season found to be deficient; the dry season did not suit early root crops, and the attack of aphis nearly destroyed some and injured all pieces more or less. The crop of white Turnips is also deficient and the quality inferior; some pieces of green round, sown in the last week of July, are however very good, and afford excellent food for the cows and young stock, as well as the sheep, upon this farm daily; they are pulled and carted upon dry pastures for feeding, the stock returning to the yards at night. The easy distance from this farm to the metropolis, and a railway station being within two miles has induced us to keep cows, the milk from which is supplied to the London market, and at the present moment the sum of 1*s.* 3*d.* for the barn gallon of 17 pints is obtained, free of carriage. The cows are milked twice in 24 hours, viz., at 10 o'clock A.M., and at 12 o'clock at night; the amount realised is about equal to charting and selling the butter at 1*s.* 3*d.* per lb., and the skim milk at 3*d.* per gallon of eight pints. It was our practice, upon first commencing this system, to feed the cows upon grains with large quantities of oil-cake, bran, and other purchased food; but it is now effected upon the produce of the farm only, and this year they have been fed from the early part of September mainly upon the leaves of the Mangold Wurzel and Swede Turnips, which are cut up with hay and Oat straw into chaff—this is a desideratum in feeding that we had not before attained—for although we had applied the roots by admixture with cut chaff, the leaves had been little heeded, and the major portion was wasted by being strewed over the land upon which they had grown by way of manure, and afterwards ploughed in. We have no hesitation now in stating that both descriptions of the leaves are superior to the roots at this season, and the cows have maintained their condition, and have given an abundance of milk without unpleasant flavour. We are thus spared two months' consumption of roots, and intend next year to grow Cow Cabbages in addition for using through the early spring months in the same manner. Much discussion has taken place upon the feeding value of roots, and in the publication in which this article is inserted a long value has been attached; the price here is estimated at per ton as equivalent to the value of a stone of meat by graziers. The ordinary selling price is 12*s.* per ton at the time of pulling in the field, and they may be readily sold at that price. The mode of estimating roots upon merely their fattening properties is not the true mode of fixing their value. From the large proportion of water they contain, they are rendered proportionately of little value when combined with nitrogenous oleaginous food, and therefore they ought to be considered rather as an adjunct to other food for fattening cattle and sheep than as a substitute for that purpose themselves, and for this purpose when Mangold Wurzel is combined with cut chaff and Linseed or other meal, it excels as a feeding root, but used in large quantities by itself is of comparatively little value. The crops of the last year have been sufficiently tested to ascertain the result: the Wheat yields about 6 bushels per acre above an average crop, and Oats and Peas in the same proportion; Barley can hardly be considered so much; and the Bean crop is a failure altogether. This may be taken as the fair estimate upon the light and mixed soils of this country; but upon the heavy clay land the yield is not above an average one. Our south-down wether sheep have been feeding upon Swede Turnips sliced for the last 10 weeks, with the addition of ¾ lb. of oil-cake per diem. The Turnips, however, have certainly less fattening property than usual, and the cost of the cake is so high as to institute a loss; it is considered that 1 cwt. of good oil-cake will not produce more than 8 lbs. of mutton, and therefore with cake at 12*s.* to 13*s.* per hundredweight, a loss of 7*s.* to 7*s.* 6*d.* takes place upon each hundredweight fed out; that is, assuming that each ton of Turnips will keep a sheep of 9 stones 77 days (and this is the exact quantity consumed), in addition to ¾ lb. of best American cake per diem, equal to 51 lbs., or, in round numbers, 56 lbs. for that period. The cake will be 6*s.* 6*d.*, the Turnips and labour 10*s.*, altogether 16*s.* 6*d.* per head; deduct a moiety for manure gives 8*s.* 3*d.* to meet the intrinsic value of the animal, or 1 stone of 8 lbs. at 5*s.* for the Turnips and 3*s.* 3*d.* for the half cwt. of oil-cake, pretty much in accordance with the before-stated computation. The price of Potatoes is very high, 3*s.* to 3*s.* 6*d.* per bushel of 60 lbs., but the quality is excellent. Grass hay realises 70*s.* to 80*s.* per ton; but good Clover yields 90*s.* to 110*s.* A larger proportion to the Wheat and Barley crop than usual has already found a market. The process of steam-threshing is extending in every direction, and the facility of supplying the market rendered so easy without staying the other processes of the farm, that a regular and liberal supply has been afforded. This day (Christmas), is exceedingly mild, and Roses and other flowers may be seen in abundance.

Notices to Correspondents.

Poultry Prize List, Birmingham. We had not room for a full list of the winners of the prizes at the Poultry Show in Bingley Hall; and we cannot give one now: but we regret to have occasion to correct the list we gave, which included merely the names of those receiving first prizes, whether silver vases or otherwise, in the more important classes. In the class of Poland (white crested white) *chickens*, the name of W. G. Vivian, Esq., Singleton, Glamorganshire, was omitted. In the class of Dorkings (coloured) the first prize (silver vase) was awarded to Rev. S. Donne, of Oswestry, whose name is also omitted. And among the Cochin China classes the 1st prize (silver vase) in class 23 was awarded to C. Punchard, Esq., Haverhill, Suffolk.

Rotation: *W H B.* The eight-field course recommended to you is an improvement on your present practice, and it is, we believe, suitable to your light land. Lime may be applied on the Wheat stubble. Twenty-five acres of Swedes, &c. (which may include Mangold Wurzel, Cabbage, and even a few acres of Rye sown on the Wheat stubble, and ploughed up for Turnips), will be ample green food for your purpose.

SPLENDID NEW RHUBARB.
SALT'S CRIMSON PERFECTION.

ROBERT SALT begs leave to inform the Gentry, Nurserymen, Gardeners, &c., that this splendid variety of Rhubarb is now ready for distribution. It is universally allowed to be the most early, prolific and delicious variety ever offered to the Public.

See *Gardeners' Chronicle*, June 11, 1853: "Very good, and of a most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."—Ed.

Certificates of Merit were awarded for specimens exhibited at the Meeting of the Horticultural Society, Regent Street, London, June 28th, 1853—at Nottingham, May 24th, 1854—at Derby Midland, May 25th, 1854—at Ormskirk, Lancashire, August 30th, 1854. Price 7*s.* 6*d.* per root, 3 for one guinea, and 6 for 2*l.*

Orders addressed to Robert Salt, Longton, Staffordshire; or the following agents, will have immediate attention: Messrs. Hurst & M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess & Kent, Penkhull, Staffordshire; Mr. Wood, Nurseryman, Coppice, near Nottingham; Messrs. Francis & Arthur Dickson, East-gate Street, Chester; Messrs. Jas. Dickson & Sons, 102, East-gate, Chester, and 106, Deansgate, Manchester; Mr. Salisbury, Melbourne, Derbyshire. A liberal discount allowed to the trade. A Post-office order from unknown correspondents.—Longton, Dec. 30.

A. VERSCHAFFELT, Nurseryman, Ghent, Belgium, begs to offer to the trade:—

Lilium lancifolium album, strong bulbs, ... per 100	£3	0	0
,, speciosum ,, ... ,,	5	0	0
,, Browni (true), ... ,, ... ,,	0	7	6

The Bulbs are strong and healthy.

A. V. begs to offer also good and fresh Seed of the fine LILIUM GIGANTEUM at the following prices:—A Parcel of 50 Seeds, 7*s.* 6*d.*; ditto 100 ditto, 13*s.*

P.S. The last number of the first volume of Verschaffelt's L'ILLUSTRATION HORTICOLE is just out, and contains:—1, Magnolia Lennè; 2, Gentiana Fortunei; 3, a plate with seven new Geraniums (Odier); 4, Azalea indica alba illustrata; and 5, a View of the Editor's Horticultural Establishment.

R. PARKER begs to offer the following CHOICE SEEDS, all of which are warranted new and true to name:

GODFREY'S (BLACK SPINE) CUCUMBER, the finest variety in cultivation, packets containing 12 seeds 1*s.* 6*d.*

Also the following esteemed varieties of CUCUMBERS and MELONS, in packets containing 12 seeds, at 1*s.* each:—

CUCUMBERS.	MELONS.
Henderson's Black Spine.	Victory of Bath.
Improved Patrick.	Beechwood.
Walker's Long Rambler.	Bromham Hall.
Manchester Prize.	Canteloupe.
Hunter's Prolific.	Duke of Bedford.
Superlative Improved.	Golden Perfection (extra fine).
Cuthill's Black Spine.	Scarlet Flesh (Anderson's).

Ohio Squasha Custard Gourd, 6*d.* ... ... per packet.
Antirrhinum, from named flowers, 6*d.* ... ... ,,
Calceolaria, from fine varieties, 1*s.* 6*d* and 2*s.* 6*d.* ,,
Hollyhock, from fine named varieties, 1*s.* 6*d.* and 2*s.* 6*d.* ,,
Lilium giganteum, the most distinct and noble species of the genus, packets containing 20 seeds, 2*s.* 6*d.*

*** A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

BANKS' NEW SEEDLING FUCHSIAS FOR 1855.

W. J. EPPS begs to state that he has purchased the following Seedling Fuchsias, raised by that celebrated grower, E. Banks, Esq., of Sholden Lodge, Deal; they were the first selection from his splendid batch of Seedlings of 1854, and have been thoroughly proved. They are distinct, rich, and the greatest advance upon any of the kinds known, and cannot fail to give the highest satisfaction.

CLIMAX.—(named by Mr. Banks).—Tube stout, sepals very broad reflex, with a pretty curve or half circle, the points of the petals touching the seed vessel; colour, rich velvety crimson—the corolla is very large, of a splendid violet blue and great substance: habit, robust, and blooms particularly free. 7*s.* 6*d.*

FAIRY QUEEN.—Very distinct and striking, immense bloomer, beautiful waxy white tube and sepals, tinged with lemon; long well-proportioned flower; corolla large, and of a very rich plum colour puce. 7*s.* 6*d.*

GRAND SULTAN.—A very noble flower, and will be many years before it is equalled; beautiful foliage, and first-rate for exhibiting; flowers large, very stout, sepals reflex, similar to the Turn Cap Lily, and of a very rich crimson colour; corolla large, and very dark velvety purple. 7*s.* 6*d.*

MAID OF KENT.—This Fuchsia is pronounced by the following judges, viz., Mr. Edwards, Secretary to the Floricultural Society; Mr. Barnes, of Camden Nursery; Mr. Todd, of Sutton, to be the prettiest and most distinct Fuchsia yet raised; habit, dense and bushy, producing great clusters of pretty reflexed blooms, of great substance, very clear waxy white, with a rich plum-coloured puce corolla, and exceedingly striking. 10*s.* 6*d.*

BEAUTY OF THE BOWER.—A very rich and perfect formed flower, scarlet tube and sepals, which reflex over the tube, displaying a beautiful dark purple corolla of great substance: habit, perfect. 7*s.* 6*d.*

OMER PACHA.—A large and well-proportioned flower, with dark crimson tube and sepals: corolla, intensely dark velvety purple: habit, excellent and very graceful. 7*s.* 6*d.*

The Set will be sent out in April.—Strong Plants, at 42*s.*

The usual discount to the Trade where three of each are taken.

Agent:—Hurst and M'Mullen, Seed Merchants, Leadenhall Street, London.—Bower Nurseries, Maidstone.

WILLIAM BARRATT, Landscape Gardener, Wakefield.

*** Plans and Estimates furnished.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S Horticultural Works, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

GARDEN NETS, FISHING NETS, SHEEP NETS, and RABBIT NETS, made by Machinery, and supplied at very low terms. Samples sent free.—R. Richardson, 21, Tonbridge Place, New Road, near King's Cross, London.

WIRE FENCING, 6¾*d.* per square yard, in various widths, from 6 feet to 15 inches, mesh less than 2 inches. An effectual fence against Hares, Rabbits, Sheep, Deer, &c., and for the enclosure of Poultry, Pheasants, &c. 4-inch mesh, 4*d.* per square yard.

R. Richardson, 21, Tonbridge Place, New Road, London.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide, 1*s.* per yard run—admits light and excludes cold; thick Canvas Tarpauling, 1*s.* per square yard; thick Canvas Waxed Sheeting, 1*s.* per square yard, may be had various widths. These Canvases are excellent for roofing Sheds and Outhouses, as they are quite waterproof.—R. Richardson, 21, Tonbridge Place, Judd Street, New Road, London. N.B. Waterproof Capes, large size, 3*s.*; Police Capes, 18*s.* and 24*s.* per dozen; Driving Aprons, Capes, and Coats of India Rubber, Horses' Loin Cloths, Waggon and Cart Covers, Sacks, &c.

CLASS FOR CONSERVATORIES, ETC.

HETLEY and CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

CLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

6 in. by 4 in. to 6 in. by 5½ in. ...	13*s.*	3*d.*	}	per 100 feet.
7 by 5 to 8 by 6	13	6		
8½ by 6½ to 10 by 8 ...	14	0		
10½ by 8¼ to 14½ by 10½ ...	16	0		
17 by 10 to 18 by 12 ...	18	0		

A great variety of sizes. Particulars had on application.

ORCHARD HOUSE SQUARES on Mr. Rivers's plan, to whom I have sold some thousands of feet.

Large Sheets for cutting up, in cases, at 2½*d.* and 3*d.* per foot.

HARTLEY'S IMPROVED ROUGH PLATE GLASS, Sheet, and Rough Plate, Tiles, Milk Pans, Bee and Propagating Glasses, Wasp Traps, Cucumber Tubes, Preserve Jars, with and without covers; Fern Glasses.

Plate, Sheet, Crown, and Ornamental Window Glass. Crystal Glass Shades for ornaments.

Greenhouses, erected in either wood or iron. Garden Lights and Frames.

87, Bishopsgate Street Without, London—same side as Eastern Counties Railway.

CLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS and Co. have the pleasure to hand their present prices of Glass for Cash:—

	SHEET SQUARES. In Boxes of 100 feet.			CROWN SQUARES In Boxes of 100 feet
Under 6 by 4	£0	12*s.*	6*d.*	8*s.* 6*d.*
6 by 4, and 6½ by 4½	0	13	0	12 6
7 ,, 5, — 7½ ,, 5½ }	0	15	0	14 0
8 ,, 6, — 8½ ,, 6½ }				
9 ,, 7, — 10 ,, 8, 12 by 9, 12 by 10, 14 by 10 }	1	0	0	

Larger Sizes, not exceeding 40 inches long.

16 oz. from 3*d.* to 3½*d.* per square foot, according to size.
21 oz. ,, 4½*d.* to 5*d.* ,, ,, ,,
26 oz. ,, 6*d.* to 7½*d.* ,, ,, ,,

SIXTEEN-OUNCE SHEET GLASS OF ENGLISH MANUFACTURE FOR ORCHARD HOUSES, the same quality as we supply to Mr. Rivers, and of various dimensions, always on hand,

Double-crown Glass of various dimensions in 100 feet boxes.

Glass Tiles, ¼ of an inch thick, packed in cases, containing 50, at 1*l.* 17*s.* 6*d.* per case. Packages 2*s.* each extra, but allowed for when returned.

Glass Milk Pans, 21*s.* per dozen; Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoys' Milk Syphons, Wasp Traps; Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, and every article in the trade.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

CLAYTON, SHUTTLEWORTH, and CO.'S PRIZE PORTABLE STEAM-ENGINES, and COMBINED THRASHING, STRAW SHAKING, RIDDLING, and WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as thrashed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. and Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading agricultural shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

SHOOTING.

WANTED, within 40 miles of London, the exclusive right of Shooting over from 400 to 1000 acres of good Cover and Partridge Ground; not particular to present stock of game. Early possession will be required.—Address to W. A., 2, King's Road, Bedford Row, London.

TO NURSERYMEN, GARDENERS, AND OTHERS.

PERSONS desirous of giving in TENDERS for the forming, making, and completing the Walks and Carriage Drives, and for the Levelling, Draining, and Planting the Ground for the DONCASTER CEMETERY (about 7 acres and a half), may see the Plan and Specification at Mr. Alexander's Office, in St. George-gate, Doncaster, from Monday, the 8th, to Monday, the 15th of January, 1855. The Tenders endorsed "Tender for making the Roads and Walks, and for Levelling, Draining and Planting the Doncaster Cemetery Ground," to be addressed, under cover, to the Clerk to the Commissioners on or before the 20th of January, 1855.

T. B. Mason, Clerk to the Commissioners.

Town Clerk's Office, Doncaster, Dec. 28, 1854.

BRAMAH POOTRA FOWLS.

TO BE SOLD, a few Pairs of this breed. The birds are pure bred, in good health, and the Pullets now laying.—For particulars, apply to R. J. Simpson, Sandbach, Cheshire.

SEBRIGHT BANTAMS, remarkably handsome and well feathered, price 5*s.* each, basket 1*s.* Forwarded to any part on receipt of Post Office Order made payable to Mr. Gervase Freeman, Lullington, Burton-on-Trent.

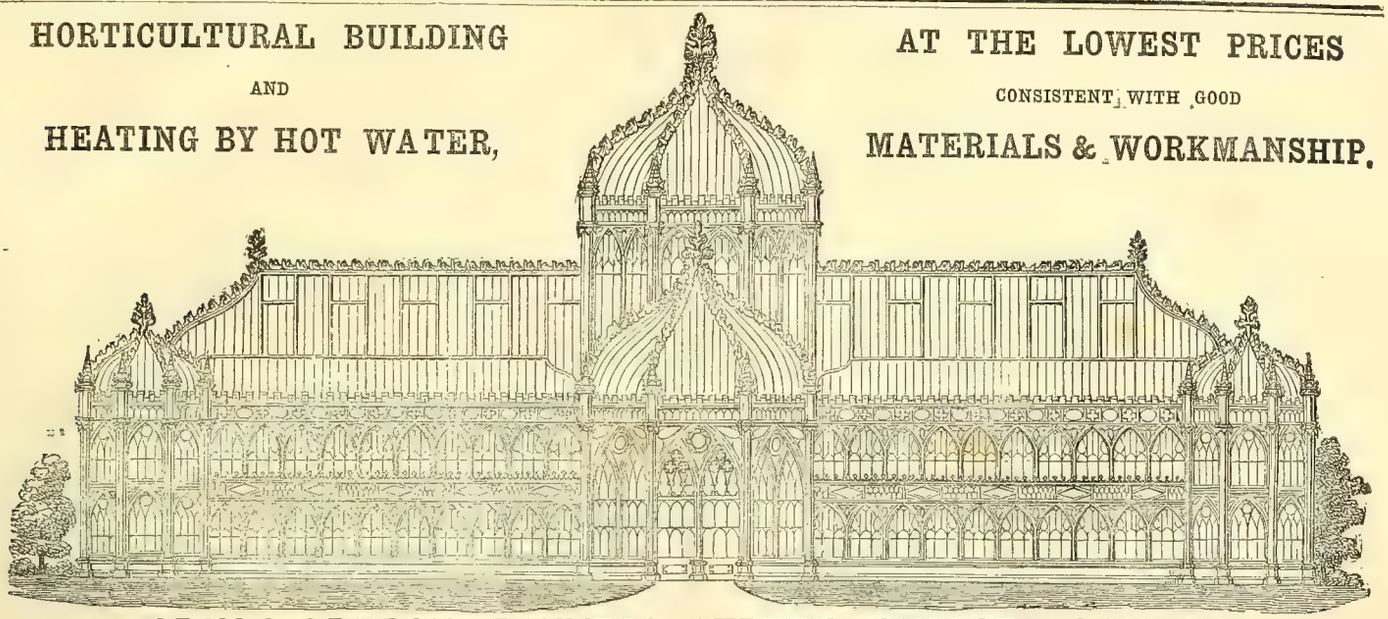
TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

FANCY POULTRY—PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction at his Great Room, 38, King Street, Covent Garden, on TUESDAY, January 2d, at 12 o'clock precisely, a selection of very choice POULTRY, from the yard of Mrs. Hosier Williams, of Eaton Mascott, consisting of all the favourite varieties. Also many first class Birds from C. J. Mold, Esq., of Belper; Mr. Gibbs, Henfield; Mr. Ely, Hounslow, including White and Buft Cochins, Spanish, Polands, Hamburghs, Dorkings, Choice Fancy Pigeons, &c.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. Stevens, 38, King Street, Covent Garden.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

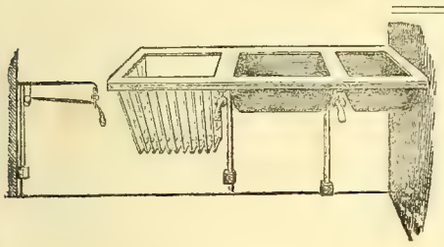


GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.



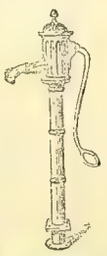
COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, as one Fixture, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest.

COTTAM'S ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.

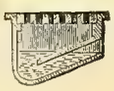
IMPROVED PUMPS,

OF THE BEST WORKMANSHIP AND WARRANTED.



The VALVES and SUCKERS of these Pumps are constructed upon an entirely new and SIMPLE principle; they are not likely to get out of order; should they do so, can easily be repaired, as the Pump is so contrived that the valves can readily be got at.

An Improved CAST IRON TRAP, strongly recommended by the Sanitary Commissioners, and suitable for Sugar Bakers, Slaughter Houses, &c. &c. It is so formed that the Trap-plate will pass any matter the top grating will let through, and therefore is not liable to stoppages; and well adapted to Stables and Stable-yards, for saving the best part of Liquid Manure.



Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

Just published.

SUTTON'S PRICED SEED AND PLANT LIST, WITH INSTRUCTIONS ON CULTIVATION, CALENDAR OF OPERATIONS, and other Useful Information is now published, price Sixpence; and being entered at Stationers' Hall is copyright.

As this publication is compiled principally for the use of Messrs. SUTTON'S CUSTOMERS, it is requested that those who have not yet received it will forward their Address, when a copy will be sent gratis, and post free. Other persons will receive it post free in return for six postage or receipt stamps.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1855, *with Newspaper Stamp to go Free by Post, is now published.*

The proprietors of this well-known Publication have endeavoured, in the present edition, to render it even more complete than the last; and have again obtained the valuable assistance of Mr. Robert Errington, Gardener to Sir P. Egerton, Oulton Park, who is acknowledged to be one of the best practical writers on Horticulture of the day.

It will contain a very valuable descriptive list of KITCHEN GARDEN SEEDS, with prices affixed to every article, and in addition to the descriptions, there will be short and concise cultural remarks for every kind of Vegetable, pointing out the best varieties for early, medium, and general crops.

The List of FLOWER SEEDS has been much improved, and contains descriptions of all the leading sorts, with directions for sowing seeds, and other useful practical remarks; and in this department Mr. Errington has written expressly for the work an original article on ANNUAL AND OTHER FLOWER SEEDS, which will be read with much interest.

The CALENDAR OF OPERATIONS for the whole of the year has also been revised, and will be found even more useful than the one in the last edition.

There will be a good Garden ALMANACK as usual, and the detailed quantities of seeds contained in their useful COLLECTIONS OF SEEDS are given in full.

A valuable report of the experiments in their TRIAL GROUNDS is also given, and descriptions of the NEWLY INVENTED CLOCHE, or Hand Glass, and of the new CHINESE POTATO (DIOSCOREA BATATAS). The following original articles have also been written expressly by Mr. Errington—on VEGETABLE FORCING, LIGHT AND AIR, LIQUID MANURE, and ROTATION OF CROPS. And in addition to the above, the proprietors have been favoured with an original paper by J. B. Lawes, Esq., of Rothamstead Park:—"ON THE ARTIFICIAL MANURES MOST SUITABLE FOR THE GROWTH OF BARLEY.

At the request of several correspondents the Publishers have printed the present Edition the size of the "Gardeners' Chronicle," so that those who wish it can bind it with the present volume of that valuable Paper. It contains 32 folio Pages, "Chronicle" size.

Copies can be procured, price 6*d.* each, or free to purchasers of seeds; and can be obtained through the medium of any bookseller in the United Kingdom, from the

LONDON PUBLISHING OFFICE, 294, STRAND;

Or from the Proprietors, WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

Now ready, price One Shilling,

THE NATIONAL GARDEN ALMANACK, HORTICULTURAL TRADE DIRECTORY, AND FLORISTS' DIARY FOR 1855. By JOHN EDWARDS, F.H.S.

Wholesale Packets for the nursery trade may be obtained at 2*l.*, containing 50 copies; 1*l.*, containing 24 copies; 10*s.* 6*d.*, containing 12 copies from the author only. They will be delivered free to any of the London Seedsmen, or otherwise in town, as may be directed.

London: CHAPMAN and HALL, 193, Piccadilly.

THE JOURNAL OF AGRICULTURE, AND THE TRANSACTIONS OF THE HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, FOR JANUARY, 1855. No. XLVII. Price 3*s.*, or 12*s.* per annum.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

PROFESSOR JOHNSTON'S CHEMISTRY OF COMMON LIFE. Volume II., Completing the Series, is now published, with a Copious Index, price 6*s.* 6*d.*, bound in cloth.

The First Volume has been reprinted, price 5*s.*, in cloth.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

PEOPLE'S EDITION OF ALISON'S HISTORY OF EUROPE.

This day is published,

PART XXVIII. Price One Shilling.

VOL. VIII. Price Four Shillings, bound in cloth.

ATLAS OF MAPS AND PLANS. Part VII. Price 2*s.* 6*d.*

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

A SUPPLEMENT, GRATIS, WITH THE WEEKLY DISPATCH, EVERY WEEK UNTIL FURTHER NOTICE.—The unexampled interest which attaches to every incident connected with the operations of the Allied Armies in the East has determined the Proprietors of the WEEKLY DISPATCH to devote a greater space to the intelligence from the seat of war than the ordinary limits of this, the largest newspaper published, could possibly afford; and, with the view of giving the amplest details, they have resolved upon the issue of a SERIES OF SUPPLEMENTS, GRATIS, which will include every particular of interest connected with the Siege and decision of the contest at Sebastopol, and will be continued whenever demanded by the progress of the Campaign.

By the publication of these Supplements the portion of the Paper usually devoted to incidents of domestic and political importance will be reserved intact, and the engrossing subject of the War will receive the fullest and most varied illustration.

A SUPPLEMENT WILL BE PUBLISHED ON SUNDAY NEXT (GRATIS), and on every succeeding week until further Notice.—Orders may be given to all Newsvendors in town and country; and to the publisher, at the *Dispatch* Office, 139, Fleet Street, London.

LAND DRAINAGE.

MR. BAILEY DENTON'S TABLES OF COST, &c., price 1*s.* 4*d.* Sold by METCHIM, Parliament Street.

MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1*l.* 10*s.* Sold by JONES & Co., High Holborn, London.

Illustrated London News.

THE YEAR 1855 bids fair to be one of the most important and eventful of modern history. On the 6th of January, 1855, will be issued the first number of a new volume of the ILLUSTRATED LONDON NEWS, and not merely a new volume, but of a New Year—each volume being perfect and complete in itself—containing, for the time, a faithful record, pictorial and descriptive, of all Events of Interest in every part of the world. To that limited portion of the public who do not subscribe to this Journal it may be stated that no period could be selected more opportune for commencing,—the whole expense being but 26*s.* per annum, exclusive of double numbers, which are issued on rare occasions, when it would be impossible to crowd the important events and Engravings into a single number; for this small sum the subscriber will receive 24 large pages—72 columns—of the most interesting information, carefully selected from the News of the Week, interspersed with a variety of charming Articles on the chief topics of the day.

The ILLUSTRATED LONDON NEWS has, by its impartial and consistent advocacy of the welfare of the public, secured for itself a political influence scarcely second to any Newspaper in the Empire; and reference can, with some pride, be made to the support afforded to all beneficial measures proposed and adopted by the English Parliament.

Foreign Politics will ever command the attention which ought to be devoted to so important a feature of a Newspaper. On the question of the Russian War, during the year 1854, ONE THOUSAND ENGRAVINGS appeared in the ILLUSTRATED LONDON NEWS. Extensive arrangements, calculated to improve this popular Journal, and engagements such as will greatly enrich its Literary, Scientific, and other departments, have been made, and will thus combine on this Paper the greatest talent of the day.

The ILLUSTRATED LONDON NEWS has been established 13 years, during which period it has received a greater degree of encouragement and approbation than any Journal ever published. This is proved by the Return of Stamps issued from time to time by order of Parliament. The Stamps applied for the first six months of 1854 were upwards of 2,734,000—showing a WEEKLY CIRCULATION OF UPWARDS OF ONE HUNDRED AND THIRTY THOUSAND COPIES!

Terms (for payment in advance)—Half-year, 13*s.* 6*d*; Year, 26*s.*

Any of the Volumes of the ILLUSTRATED LONDON NEWS, from the commencement to the present time, may now be had, in paper or cloth. Covers for Binding the Volumes 2*s.* 6*d.* each.

All Numbers may be sent free by post to any part of the Kingdom and the Colonies.

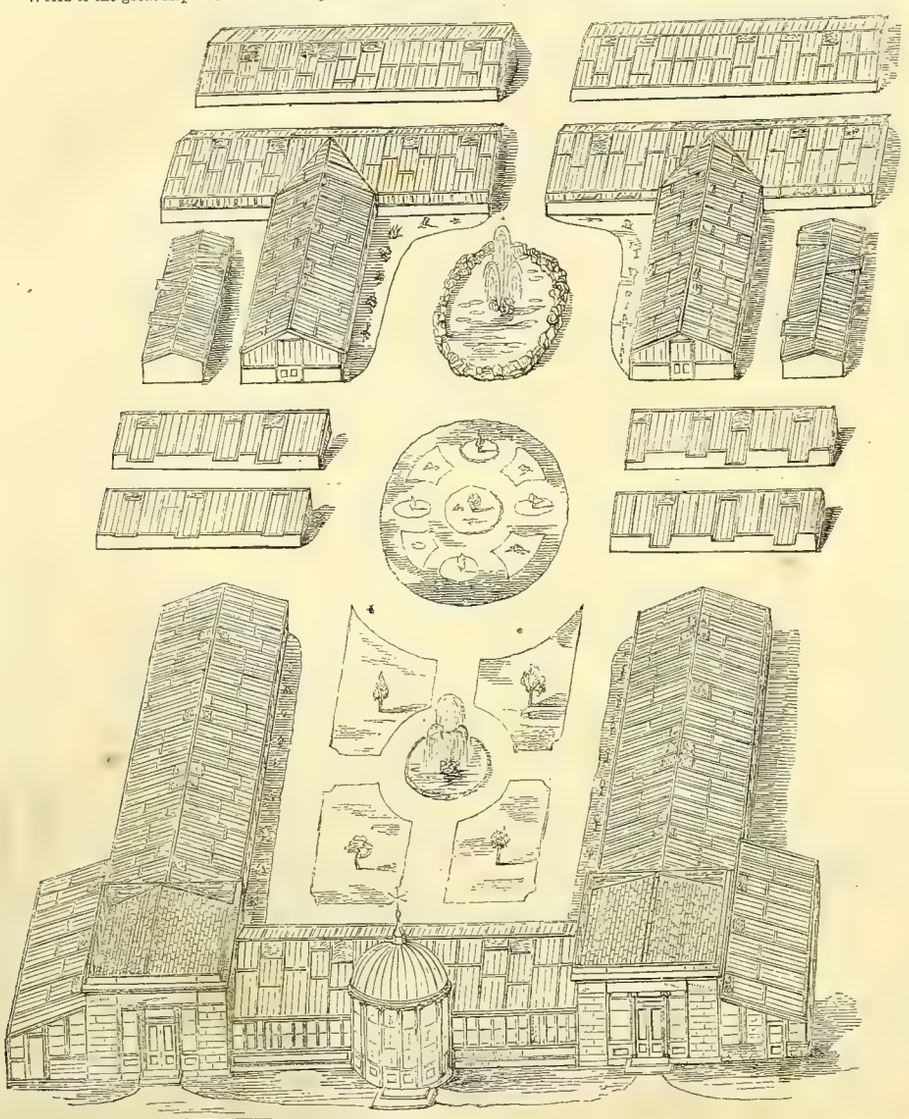
Give an order for six months to ensure all the gratuitous Prints and Supplements. Supplied by all Booksellers and Newsmen.

The ILLUSTRATED LONDON NEWS is published in London every Saturday, stamped, to go free by post, 6*d.* per copy.

Office, 198, Strand, London.

JOHN WEEKS AND CO.'S
HORTICULTURAL ESTABLISHMENT, KING'S ROAD, CHELSEA.
THE WHOLE HEATED BY ONE BOILER.

THE LENGTHENED NOTICE of this Establishment, which appeared in the *Gardeners' Chronicle* of the 16th inst., directed the attention of the Horticultural World to the great improvements made by Messrs. Weeks & Co. in the method they have recently adopted for heating it, and in order to give some idea of the character of the Establishment to numerous Correspondents whose distauce from town does not admit of their personally inspecting it at present, the adjoining sketch has been made, and the following observations are most respectfully submitted to them and all others interested in Horticultural proceedings.



This Establishment is now the most complete of any in the country, consisting of Conservatories, Greenhouses, Hothouses, and several Pits, with top and bottom heat, all appropriated to their several purposes.

Until very lately there were six boilers of various sizes, but all on the same principle, employed here to heat the different Houses and Pits, and although those boilers were found both efficient and economical during eight years, each doing three imes more work than the common description of boiler, recent improvements convinced Messrs. Weeks & Co. that highly important results were attainable by substituting one boiler, of a similar construction, for the six; and now, the whole of this extensive establishment is heated effectually by *one* boiler, 5 feet high by 3 feet 6 inches in diameter, exposing to the immediate action of the fire a surface of 340 feet, superficial. The expense attending this great alteration of connecting all the pipes f the various houses and pits to one boiler will be fully repaid in one season. The boiler is fed from the top, which is nearly on a level with the surface of the surrounding ground, but there are furnace doors, and the usual openings in the brickwork below, from which it is cleared out, and to cause a draft. The glass-houses, which may be said to be built round the four sides of a long square, or parallelogram, which has a gentle fall to the end farthest from the boiler, are certainly well placed for being all warmed from one boiler, which is effected as follows:—The boiler is placed at, say, the right-hand corner of the square. A 4-inch flow pipe is led in a straight line from it on the same side to the bottom of the square, or as far as there are houses, and the return pipe is brought back to the boiler in the same drain immediately below it. Another main 4-inch flow and return pipe is taken through the show houses and down the other side of the square, to furnish means of heating the houses on that side, and from these two main pipes all the houses are warmed by connecting the pipes which are carried round them with the two main pipes just mentioned, which are also made to pass through as many houses as lie in their way; and in order that the heat they contain may be turned to as good an account as possible, the drains in which they are placed have been covered, inside the houses, with neat iron gratings, which permit the warmth to pass through into the house.

The whole of the several Houses and Pits can be heated at one time, or separately, with a full command of heat, and any part regulated at pleasure.

If the Houses and Pits were placed in a line, they would extend about 1000 feet, exposing to the atmosphere upwards of 16,000 superficial feet of glass. The water circulates in the various Houses and Pits through 5000 feet of pipe.

An experience of upwards of thirty-six years as Horticultural Builders, and Hot-Water Apparatus Manufacturers, having afforded Messrs. Weeks & Co. constant opportunities for effecting important practical improvements in Building and Heating, induced them to build the ir present Nursery, so that the Nobility and Gentry about to erect Horticultural Buildings, might have the means afforded them of inspecting an extensive variety of Horticultural Houses and Pits with the Heating Apparatus in full operation.

The extraordinary efficiency and economy of the heating apparatus will perhaps be better understood by the following comparison of the work it does in Messrs. Weeks' Establishment, and the work done by the 12 boilers at the Great Palm House, at the Royal Gardens, Kew:—

THE HOUSES AND PITS AT MESSRS. WEEKS AND CO.'S

Measure in length	1,000 feet
Superficial feet of surface covered	13,480 ,,
Surface of glass exposed to the atmosphere	16,000 ,,
Length of pipe to heat the whole	5,000 ,,
Fuel consumed in 24 hours during the winter months, at a cost of 3*s.* per day	3 sacks of coke.

The boiler requires attention only once in 12 hours, and then but for one hour; thus occupying a man but for two hours out of the 24, at a cost of say 8*d.* per day.

THE GREAT PALM HOUSE, KEW,

Measures in length	355 feet
Superficial feet of surface covered	23,900 ,,
Surface of glass exposed to the atmosphere	42,200 ,,
Length of pipe to heat the whole	15,000 ,,
Fuel consumed in 24 hours during the winter months, being two parts coke and one part coal, at a cost of 4*l.* 16*s.* per day	72 sacks

The boilers, 12 in number, occupy the whole attention of two men by day and one by night, at a cost of say 10*s.* per day.

It results from the foregoing statements that the Apparatus of Messrs. Weeks, with one boiler, is doing about as much work as four boilers do in the Kew Palm House; and that with three, or, at most, four boilers such as Messrs. Weeks have now in use, the Great Palm House at Kew could be heated at a cost in fuel and labour of 14*s.* 8*d.* per day, effecting a saving of, say 1095*l.* per annum. Messrs. Weeks assert that there is not in the kingdom an apparatus doing anything like the same work with one boiler, nor, under any circumstances, at so trifling an expense.

The Nobility and Gentry who may honour this Establishment with a visit will be no less struck with the extensive and splendid collection of STOVE and GREEN-HOUSE PLANTS, which are kept in the highest state of cultivation and are for sale at very low prices, than they will be by the very perfect arrangements above described for supplying each compartment with the necessary warmth. They will also find a fine assortment of strong GRAPE VINES in pots from eyes, all of the best sorts, and STRAWBERRY PLANTS for Forcing in the finest condition.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to

JOHN WEEKS & CO., King's Road, Chelsea, London.
